Current Counter-measures and Responses by the Domain Name System Community

Paul Twomey
President and CEO

22 April 2007

APEC-OECD Malware Workshop
Manila, The Philippines
What we want you to do today

• Understand the risks to the Internet as we have known it for over 30 years
  – Security and stability of addressing and routing
• Become partners in managing these risks
• Understand how your interests are affected by ICANN’s policy work
• Get involved in creating the policy that sets how the Net connects you to your customers
• Understand the opportunities and risks the upcoming liberalising of gTLDs offers
Internet’s unique identifiers were coordinated through the Internet Address Naming Authority

Jon Postel
1943–1998
Need for change circa 1996–97

- Globalisation of the Internet
- Commercialisation of the Internet
- Lack of competition in the domain name space
- Trademark-domain name conflicts
- Need for a new model of governance
ICANN mission statement

• To coordinate, overall, the global Internet's system of unique identifiers, and to ensure stable and secure operation of the Internet's unique identifier systems. In particular, ICANN coordinates:

  1. Allocation and assignment of the three sets of unique identifiers for the Internet:
     • Domain names (forming a system called the DNS)
     • Internet protocol (IP) addresses and autonomous system (AS) numbers
     • Protocol port and parameter numbers
  2. Operation and evolution of the DNS root name server system
  3. Policy development reasonably and appropriately related to these technical functions
Principles of operation

1. Contribute to stability and security of the unique identifiers system and root management
2. Promote competition and choice for registrants and other users
3. Forum for multi-stakeholder bottom-up development of related policy
4. Ensure on a global basis an opportunity for participation by all interested parties
From Thin Pipe to Fat Pipe

The greater the demand for Internet-based services, the larger and more complex the Internet ecosystem becomes.
Explosion in Internet growth
Competition in the Domain Name Space

- ICANN introduced competition to the domain name space
- Registrars now have a market and a business
- Consumers have greater choice in price and services
- Domain name marketplace is even driving how we search – contextually as well as topically – and the scale of sites that can be searched
- Total registrars = 888 and counting
Snapshot of the domain name marketplace

More than 120 million domain names registered globally today
The Internet ecosystem

Some organisations concerned with the Internet

Internet Governance Forum

Internet Architecture Board

ICANN

W3C

INTERNET SOCIETY

The Internet ecosystem

Some organisations concerned with the Internet

Five Regional Internet Registries (AS and IP addresses)

ARIN
- North America – Canada, United States, several islands in the Caribbean Sea and North Atlantic Ocean

APNIC
- Most of Asia
- Australia/New Zealand
- Pacific Islands

LACNIC
- Latin America
- Caribbean Islands

AfriNIC
- African Region

RIPE NCC
- Europe
- Middle East
- North Africa
- Parts of Asia

APNIC
ICANN's community

BOARD OF DIRECTORS

- 17 voting delegates + 6 non-voting delegates

- Governmental Advisory Committee (GAC)
- Technical Liaison Group (TLG)

ASO
- Regional Internet Registries
  - ARIN
  - RIPE NCC
  - LACNIC
  - APNIC
  - AfriNIC

GNSO
- gTLD Registries and Registrars
- Intellectual Property
- ISPs
- Businesses
- Universities
- Consumers

CCNSO
- ccTLD registries (e.g., .us, .uk, .au, .it, .be, .nl, etc.)

ICANN Staff

President and CEO

Root Server System Advisory Committee (GAC)

Security & Stability Advisory Committee (SSAC)

At Large Advisory Committee (ALAC)
What do we stand for?

- Ensuring a single, interoperable Internet
- All can express their own language and identity, **but**…
- All can access all others
- Creativity, development and growth are encouraged
- Security of the network is maintained to ensure confidence in the model
- Stability of the experience for application development and consumer experience
- Efficient deployment of resources in support of a global network
- All relevant stakeholders have a voice and role
- Encouraging innovation, particularly at the edge of the network
Internet community – a real phenomenon with world changing values

• Bottom-up technical policy-making and decision-making
• Participation open to all who wish to do so
• Legitimacy determined by open participation and the value of the contribution to the joint effort
• Consensus-based decision making
• Cooperation, coordination and consultation among participants and groups pushing initiatives forward
• Yet, very spirited and blunt public debate
• Private agreement or contract approach to creating and managing linkages among and to the network
• Global efficiency in the allocation of resources, such as Internet Protocol addresses
Where stakeholders find common ground

- Increasingly, ICANN finds itself one of the few forums in which these issues can be raised so that solutions can be found and implemented within the Internet community
Internet infrastructure threats

1. Physical disruption of major lines and switching centers
2. Loss of routing infrastructure continuity and/or fidelity
3. Loss of DNS service continuity and/or fidelity
4. Flooding of network or specific sites, i.e., denial of service attack

Not all Internet-based systems are Internet infrastructure...
Routing infrastructure

• Status
  – Routing information is maintained in routing registries
    • These are reasonably well protected against physical attack
  – Inputs to the routing registries can be compromised
  – False routing information can be inserted

• Potential protection
  – Secure BGP has been defined and implemented

   Does not look feasible – too much hardware required

Routing security does not fall directly within anyone’s charter. What is the financial sector’s role in engaging ISPs?
DNS infrastructure root servers – status

- Root servers point to top level domains
  - 20 generic TLDs (gTLDs) – .com, .org, etc.
    - U.S. Government has .gov and .mil
  - 243 country codes (ccTLDs) – .de, .jp, .uk, etc.

- Root servers are heavily replicated
  - 13 independent businesses
  - Many-fold replication and distribution
# DNS infrastructure root servers – threats

<table>
<thead>
<tr>
<th>Threats</th>
<th>Countermeasures</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Loss of Service</td>
<td>– Excess capacity</td>
</tr>
<tr>
<td>– Network outage</td>
<td>– Distribution, replication</td>
</tr>
<tr>
<td>– Machine or site failures</td>
<td>– Strong connectivity</td>
</tr>
<tr>
<td>– Overwhelming traffic (denial of service attack)</td>
<td>– Multiplicity of businesses</td>
</tr>
<tr>
<td>– Business failure</td>
<td>– DDoS counters (long term)</td>
</tr>
<tr>
<td>• Hijacking</td>
<td>– Protocol changes, DNSSEC</td>
</tr>
<tr>
<td>– Cache poisoning</td>
<td>– Tight registrar controls</td>
</tr>
<tr>
<td>– False registration</td>
<td>– TSIG (crypto)</td>

<tr>
<td>– Fake zone transfer</td>
<td>– Crypto authentication</td>
</tr>
<tr>
<td>– Fake registrar-registry interaction</td>
<td>– DNSSEC</td>
</tr>
<tr>
<td>– Private roots</td>
<td>– DNSSEC; policy/political pressure</td>
</tr>
<tr>
<td>• Loss of coherence</td>
<td>– DNSSEC; policy/political pressure</td>
</tr>
<tr>
<td>– Unauthorized roots and TLDs</td>
<td></td>
</tr>
<tr>
<td>– Private character set extensions</td>
<td></td>
</tr>
</tbody>
</table>

Lots of work is under way. But threats are growing and this will take more time and money than many expect.
System threats

• Denial of service attacks target high-value sites
  – DNS servers are among the obvious targets
  – These will get more sophisticated
  – Action is required – see later slides

• Domain and address theft is growing
  – Spammers like to hide their identity
  – The legal framework doesn’t provide protection

Address theft, per se, is not actionable(!)
Should individual sectors lobby for this (internationally)?
The denial of service problem

- Denial of service attacks are increasing
  - This will get worse – probably much worse
- Law enforcement is important but necessarily at the wrong end of the problem
- Technical changes in the Internet would help a lot
Distributed denial of service

- On 6 February 2007 – most visible since 2002 attack but not as comprehensive as amplified DDoS attack on TLDs of 2006
- Six of the 13 root servers that form building blocks of the Internet were affected – two badly
- The attack highlighted the effectiveness of Anycast load balancing technology
- More analysis is needed before a full report on what happened can be drawn up – reasons behind the attack are unclear – a wake-up call
- Root server operators worked together in a fast, effective, and co-ordinated effort
- Recent SSAC recommendations for improving the security of the domain name system still need to be followed through – other measures should also be considered
- Coordination and preparation were key
- Did you notice?
ICANN purview

• ICANN strives to achieve coherence, stability and security
• Almost all of the operational details are carried out by others, but
  – The IANA (Internet Assigned Numbers Authority) function is within ICANN
  – L root
• Join us in both dialogue and new funding mechanisms – security foundation/gold star service, etc.
DDoS – some technical approaches

• Identification of sources of traffic
  – Tighten the routing security
• Refashion the protocols to know the identity of senders of traffic
• Distinguish between well managed computers on well managed networks vs others
  – “Well managed” means they aren’t zombies and their configuration is checked regularly
• Well managed networks quarantine computers which appear to be infected or misbehaving
• Well managed networks report misbehaviors and accept reports of misbehaviors
• Traffic among well managed networks gets preference
DDoS – customer approaches

- Pressure on the vendor to supply machines that are safe out of the box
- Establishment of an ethic that machines should be safe – it’s the vendor’s problem, not the user’s
Some ICANN initiatives

- Agreement on formal relationship between Root Server Operators and ICANN
- Tightened procedures for distributing changes to the root zone (CRADA report)
- DNSSEC deployment analysis and road map
- IPv6 transition road map (re DNS)
- DNS service robustness enhancements
- Best practices for ccTLDs
Whois database

• Some businesses see a strong need for unrestricted access to Whois information to
  – Identify cybersquatters and domain infringement
  – Investigate online fraud and phishing
  – Manage domain names and intellectual property
  – Conduct e-commerce by researching other online entities
• One major hotel chain recorded 100-plus new domain names registered in its name – or a version thereof – every day
  – Confusingly similar names led to pay-per-click sites
• Full registration data would help legitimate businesses shut down fraudulent domains
Whois concerns

• ICANN’s Security and Stability Advisory Committee (SSAC) tracking correlation between email addresses placed in Whois and incidence of spam
  – Malware predators use spamming techniques
  – Spamming uses Whois
• But, on the Internet, there is never a direct route and thus never a direct cut-off to a particular problem
• A logical approach in one area of the Internet creates problems in another area
Whois policy process

- Whois issues are being addressed through the General Names Supporting Organisation’s (GNSO’s) policy development process (PDP)
- Numerous opportunities for public review and comment
Recent public comments on Whois

• Many support full Whois access –
  – Businesses and trade organisations
  – Nonprofits engaged in fighting fraud
  – Law enforcement agencies

• Opposition to Whois from other advocacy organisations, some government agencies, some Internet users
Different views of Whois

• Privacy commissioners in the European Union
• Attention in public comments to restricted access, privacy and accuracy of the data
Enforcement of existing Whois policy

• That will remain the case until the Board approves any new policy, if any
Next steps on Whois

• ICANN staff is preparing notes for the GNSO Council on the Task Force Recommendations to –
  – Identify issues for clarification
  – Identify issues for further discussion
  – Identify potential implementation issues
  – Suggest a framework for further development of the proposal
Task force recommendation (1)

- Nonbinding recommendation to GNSO Council
- Operational Point of Control (OPoC) proposal –
  - Registrants could use an OPoC in place of the current administrative and technical contact details
  - If there was an issue with the domain name, the OPoC would contact the registrant
Task force recommendation (2)

• OPoC includes –
  – Improved procedure for correcting inaccurate Whois data

• OPoC does not include –
  – Procedure for access by rights-holders, law enforcement – suggests use of best practices for dealing with requests
Next steps

- GNSO’s Whois Task Force presented Final Task Force Report to GNSO Council March 2007
- Council will send its own recommendations to ICANN Board for consideration and decision.
- ICANN Board will review GNSO recommendations, 2nd/3rd quarter of 2007
New generic top-level domain timetable

- Next working group report to Lisbon meeting in late March
- Potentially GNSO Policy Development Process may be completed by July meeting in Puerto Rico
- Policy may be concluded by the end of the 3rd Quarter 2007
- Next round of new gTLDs in early 2008?
Consider the impact of –

• Unique industry TLDs
• Industry cross-certified
• DNSSEC
• Other anti-phishing tools?
Thank You
