ARTICLES OF INCORPORATION
OF INTERNET CORPORATION
FOR ASSIGNED NAMES AND NUMBERS

As Revised November 21, 1998

1. The name of this corporation is Internet Corporation for Assigned Names and Numbers (the "Corporation").

2. The name of the Corporation's initial agent for service of process in the State of California, United States of America is C T Corporation System.

3. This Corporation is a nonprofit public benefit corporation and is not organized for the private gain of any person. It is organized under the California Nonprofit Public Benefit Corporation Law for charitable and public purposes. The Corporation is organized, and will be operated, exclusively for charitable, educational, and scientific purposes within the meaning of § 501 (c)(3) of the Internal Revenue Code of 1986, as amended (the "Code"), or the corresponding provision of any future United States tax code. Any reference in these Articles to the Code shall include the corresponding provisions of any further United States tax code. In furtherance of the foregoing purposes, and in recognition of the fact that the Internet is an international network of networks, owned by no single nation, individual or organization, the Corporation shall, except as limited by Article 5 hereof, pursue the charitable and public purposes of lessening the burdens of government and promoting the global public interest in the operational stability of the Internet by (i) coordinating the assignment of Internet technical parameters as needed to maintain universal connectivity on the
Internet; (ii) performing and overseeing functions related to the coordination of the Internet Protocol ("IP") address space; (iii) performing and overseeing functions related to the coordination of the Internet domain name system ("DNS"), including the development of policies for determining the circumstances under which new top-level domains are added to the DNS root system; (iv) overseeing operation of the authoritative Internet DNS root server system; and (v) engaging in any other related lawful activity in furtherance of items (i) through (iv).

4. The Corporation shall operate for the benefit of the Internet community as a whole, carrying out its activities in conformity with relevant principles of international law and applicable international conventions and local law and, to the extent appropriate and consistent with these Articles and its Bylaws, through open and transparent processes that enable competition and open entry in Internet-related markets. To this effect, the Corporation shall cooperate as appropriate with relevant international organizations.

5. Notwithstanding any other provision (other than Article 8) of these Articles:

   a. The Corporation shall not carry on any other activities not permitted to be carried on (i) by a corporation exempt from United States income tax under § 501 (c)(3) of the Code or (ii) by a corporation, contributions to which are deductible under § 170 (c) (2) of the Code.

   b. No substantial part of the activities of the Corporation shall be the carrying on of propaganda, or otherwise attempting to influence legislation, and the Corporation shall be empowered to make the election under § 501 (h) of the Code.

   c. The Corporation shall not participate in, or intervene in (including the publishing or distribution of statements) any political campaign on behalf of or in opposition to any candidate for public office.

   d. No part of the net earnings of the Corporation shall inure to the benefit of or be distributable to its members, directors, trustees, officers, or other private persons, except that the Corporation shall be authorized and empowered to pay reasonable compensation for services rendered and to make payments and distributions in furtherance of the purposes set forth in Article 3 hereof.

   e. In no event shall the Corporation be controlled directly or indirectly by one or more "disqualified persons" (as defined in § 4946 of the Code) other than foundation managers and other than one or more organizations described in paragraph (1) or (2) of § 509 (a) of the Code.
6. To the full extent permitted by the California Nonprofit Public Benefit Corporation Law or any other applicable laws presently or hereafter in effect, no director of the Corporation shall be personally liable to the Corporation or its members, should the Corporation elect to have members in the future, for or with respect to any acts or omissions in the performance of his or her duties as a director of the Corporation. Any repeal or modification of this Article 6 shall not adversely affect any right or protection of a director of the Corporation existing immediately prior to such repeal or modification.

7. Upon the dissolution of the Corporation, the Corporation's assets shall be distributed for one or more of the exempt purposes set forth in Article 3 hereof and, if possible, to a § 501 (c)(3) organization organized and operated exclusively to lessen the burdens of government and promote the global public interest in the operational stability of the Internet, or shall be distributed to a governmental entity for such purposes, or for such other charitable and public purposes that lessen the burdens of government by providing for the operational stability of the Internet. Any assets not so disposed of shall be disposed of by a court of competent jurisdiction of the county in which the principal office of the Corporation is then located, exclusively for such purposes or to such organization or organizations, as such court shall determine, that are organized and operated exclusively for such purposes, unless no such corporation exists, and in such case any assets not disposed of shall be distributed to a § 501(c)(3) corporation chosen by such court.

8. Notwithstanding anything to the contrary in these Articles, if the Corporation determines that it will not be treated as a corporation exempt from federal income tax under § 501(c)(3) of the Code, all references herein to § 501(c)(3) of the Code shall be deemed to refer to § 501(c)(6) of the Code and Article 5(a)(ii), (b), (c) and (e) shall be deemed not to be a part of these Articles.

9. These Articles may be amended by the affirmative vote of at least two-thirds of the directors of the Corporation. When the Corporation has members, any such amendment must be ratified by a two-thirds (2/3) majority of the members voting on any proposed amendment.

WHOIS
GAC PRINCIPLES REGARDING NEW gTLDs

Presented by the Governmental Advisory Committee
March 28, 2007

1. Preamble

1.1 The purpose of this document is to identify a set of general public policy principles related to the introduction, delegation and operation of new generic top level domains (gTLDs). They are intended to inform the ICANN Board of the views of the GAC regarding public policy issues concerning new gTLDs and to respond to the provisions of the World Summit on the Information Society (WSIS) process, in particular “the need for further development of and strengthened cooperation among, stakeholders for public policies for generic top-level domains (gTLDs)” and those related to the management of Internet resources and enunciated in the Geneva and Tunis phases of the WSIS.

1.2 These principles shall not prejudice the application of the principle of national sovereignty. The GAC has previously adopted the general principle that the Internet naming system is a public resource in the sense that its functions must be administered in the public or common interest. The WSIS Declaration of December 2003 also states that “policy authority for Internet-related public policy issues is the sovereign right of States. They have rights and responsibilities for international Internet-related public policy issues.”

1.3 A gTLD is a top level domain which is not based on the ISO 3166 two-letter country code list. For the purposes and scope of this document, new gTLDs are defined as any gTLDs added to the Top Level Domain name space after the date of the adoption of these principles by the GAC.

1.4 In setting out the following principles, the GAC recalls ICANN’s stated core values as set out in its by-laws:

a. Preserving and enhancing the operational stability, reliability, security, and global interoperability of the Internet.

b. Respecting the creativity, innovation, and flow of information made possible by the Internet by limiting ICANN’s activities to those matters within ICANN’s mission requiring or significantly benefiting from global coordination.

c. To the extent feasible and appropriate, delegating coordination functions to or recognizing the policy role of other responsible entities that reflect the interests of affected parties.

---

1 See paragraph 64 of the WSIS Tunis Agenda, at http://www.itu.int/WSIS/docs2/tunis/off/6rev1.html
2 See paragraph 49.a) of the WSIS Geneva declaration at http://www.itu.int/WSIS/docs/geneva/official/dop.html
3 See: http://www.icann.org/general/glossary.htm#G
d. Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making.

e. Where feasible and appropriate, depending on market mechanisms to promote and sustain a competitive environment.

f. Introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest.

g. Employing open and transparent policy development mechanisms that (i) promote well-informed decisions based on expert advice, and (ii) ensure that those entities most affected can assist in the policy development process.

h. Making decisions by applying documented policies neutrally and objectively, with integrity and fairness.

i. Acting with a speed that is responsive to the needs of the Internet while, as part of the decision-making process, obtaining informed input from those entities most affected.

j. Remaining accountable to the Internet community through mechanisms that enhance ICANN’s effectiveness.

k. While remaining rooted in the private sector, recognizing that governments and public authorities are responsible for public policy and duly taking into account governments’ or public authorities’ recommendations.

2. Public Policy Aspects related to new gTLDs

When considering the introduction, delegation and operation of new gTLDs, the following public policy principles need to be respected:

Introduction of new gTLDs

2.1 New gTLDs should respect:

a) The provisions of the Universal Declaration of Human Rights which seek to affirm “fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women”.

b) The sensitivities regarding terms with national, cultural, geographic and religious significance.

2.2 ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities.

*See http://www.un.org/Overview/rights.html*
2.3 The process for introducing new gTLDs must make proper allowance for prior third party rights, in particular trademark rights as well as rights in the names and acronyms of inter-governmental organizations (IGOs).

2.4 In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing TLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced.

Delegation of new gTLDs

2.5 The evaluation and selection procedure for new gTLD registries should respect the principles of fairness, transparency and non-discrimination. All applicants for a new gTLD registry should therefore be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process. Normally, therefore, no subsequent additional selection criteria should be used in the selection process.

2.6 It is important that the selection process for new gTLDs ensures the security, reliability, global interoperability and stability of the Domain Name System (DNS) and promotes competition, consumer choice, geographical and service-provider diversity.

2.7 Applicant registries for new gTLDs should pledge to:

a) Adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new gTLD.

b) Ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.

2.8 Applicants should publicly document any support they claim to enjoy from specific communities.

2.9 Applicants should identify how they will limit the need for defensive registrations and minimise cyber-squatting that can result from bad-faith registrations and other abuses of the registration system

Operation of new gTLDs

2.10 A new gTLD operator/registry should undertake to implement practices that ensure an appropriate level of security and stability both for the TLD itself and for the DNS as a whole, including the development of best practices to ensure the accuracy, integrity and validity of registry information.

2.11 ICANN and a new gTLD operator/registry should establish clear continuity plans for maintaining the resolution of names in the DNS in the event of registry failure.
These plans should be established in coordination with any contingency measures adopted for ICANN as a whole.

2.12 ICANN should continue to ensure that registrants and registrars in new gTLDs have access to an independent appeals process in relation to registry decisions related to pricing changes, renewal procedures, service levels, or the unilateral and significant change of contract conditions.

2.13 ICANN should ensure that any material changes to the new gTLD operations, policies or contract obligations be made in an open and transparent manner allowing for adequate public comment.

2.14 The GAC WHOIS principles are relevant to new gTLDs.

3. **Implementation of these Public Policy Principles**

3.1 The GAC recalls Article XI, section 2, no. 1 h) of the ICANN Bylaws, which state that the ICANN Board shall notify the Chair of the Governmental Advisory Committee in a timely manner of any proposal raising public policy issues. Insofar, therefore, as these principles provide guidance on GAC views on the implementation of new gTLDs, they are not intended to substitute for the normal requirement for the ICANN Board to notify the GAC of any proposals for new gTLDs which raise public policy issues.

3.2 ICANN should consult the GAC, as appropriate, regarding any questions pertaining to the interpretation of these principles.

3.3 If individual GAC members or other governments express formal concerns about any issues related to new gTLDs, the ICANN Board should fully consider those concerns and clearly explain how it will address them.

3.4 The evaluation procedures and criteria for introduction, delegation and operation of new TLDs should be developed and implemented with the participation of all stakeholders.

*N.B. The public policy priorities for GAC members in relation to the introduction of Internationalised Domain Name TLDs (IDN TLDs) will be addressed separately by the GAC.*
Adopted Board Resolutions | Paris

26 Jun 2008

- Approval of Minutes
- GNSO (Generic Names Supporting Organization) Recommendations on New gTLDs
- IDNC (Internationalized Domain Name) / IDN Fast-track
- GNSO (Generic Names Supporting Organization) Recommendation on Domain Tasting
- Approval of Operating Plan and Budget for Fiscal Year 2008-2009
- Update on Draft Amendments to the Registrar Accreditation Agreement
- Approval of PIR Request to Implement DNSSEC (DNS Security Extensions) in .ORG
- ICANN (Internet Corporation for Assigned Names and Numbers) Board of Directors’ Code of Conduct
- Ratification of Selection of Consultant to Conduct Independent Review of the Board
- Appointment of Independent Review Working Groups
- Update on Independent Reviews of ICANN (Internet Corporation for Assigned Names and Numbers) Structures
- Board Committee Assignment Revisions
- Approval of BGC Recommendations on GNSO (Generic Names Supporting Organization) Improvements
Approval of Minutes

Resolved (2008.06.26.01), the minutes of the Board Meeting of 29 May 2008 are approved. <http://www.icann.org/minutes/prelim-report-29may08.htm>

GNSO (Generic Names Supporting Organization)

Recommendations on New gTLDs

Whereas, the GNSO (Generic Names Supporting Organization) initiated a policy development process on the introduction of New gTLDs in December 2005. <http://gnso.icann.org/issues/new-gtlds/>

Whereas, the GNSO (Generic Names Supporting Organization) Committee on the Introduction of New gTLDs addressed a range of difficult technical, operational, legal, economic, and policy questions, and facilitated widespread participation and public comment throughout the process.

Whereas, the GNSO (Generic Names Supporting Organization) successfully completed its policy development process on the Introduction of New gTLDs and on 7 September 2007, and achieved a Supermajority vote on its 19 policy recommendations. <http://gnso.icann.org/meetings/minutes-gnso-06sep07.shtml>

Whereas, the Board instructed staff to review the GNSO (Generic Names Supporting Organization) recommendations and determine whether they were capable of implementation.

Whereas, staff has engaged international technical, operational and legal expertise to provide counsel on details to support the implementation of the Policy recommendations and as a result, ICANN (Internet Corporation for Assigned Names and Numbers) cross-functional teams have developed implementation details in support of the GNSO (Generic Names Supporting Organization)'s policy
recommendations, and have concluded that the recommendations are capable of implementation.

Whereas, staff has provided regular updates to the community and the Board on the implementation plan. <http://icann.org/topics/new-gtld-program.htm>

Whereas, consultation with the DNS (Domain Name System) technical community has led to the conclusion that there is not currently any evidence to support establishing a limit to how many TLDs can be inserted in the root based on technical stability concerns. <http://www.icann.org/topics/dns-stability-draft-paper-06feb08.pdf>

Whereas, the Board recognizes that the process will need to be resilient to unforeseen circumstances.

Whereas, the Board has listened to the concerns about the recommendations that have been raised by the community, and will continue to take into account the advice of ICANN (Internet Corporation for Assigned Names and Numbers)'s supporting organizations and advisory committees in the implementation plan.

Resolved (2008.06.26.02), based on both the support of the community for New gTLDs and the advice of staff that the introduction of new gTLDs is capable of implementation, the Board adopts the GNSO (Generic Names Supporting Organization) policy recommendations for the introduction of new gTLDs <http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm>.

Resolved (2008.06.26.03), the Board directs staff to continue to further develop and complete its detailed implementation plan, continue communication with the community on such work, and provide the Board with a final version of the implementation proposals for the board and community to approve before the new gTLD (generic Top Level Domain) introduction process is launched.

IDNC (Internationalized Domain Name) / IDN Fast-track

Whereas, the ICANN (Internet Corporation for Assigned Names and Numbers) Board recognizes that the "IDNC (Internationalized Domain Name) Working Group" developed, after extensive community comment, a final report on feasible methods for timely (fast-track) introduction of a limited number of IDN ccTLDs associated with ISO (International Organization for Standardization) 3166-1 two-letter codes while an overall, long-term IDN ccTLD (Country Code Top Level Domain) policy is under development by the ccNSO (Country Code Names Supporting Organization).

Whereas, the IDNC (Internationalized Domain Name) Working Group has concluded its work and has submitted recommendations for the selection and delegation of "fast-track" IDN ccTLDs and, pursuant to its charter, has taken into account and was guided by consideration of the requirements to:

- Preserve the security and stability of the DNS (Domain Name System);
- Comply with the IDNA protocols;
• Take input and advice from the technical community with respect to the implementation of IDNs (Internationalized Domain Names); and

• Build on and maintain the current practices for the delegation of ccTLDs, which include the current IANA (Internet Assigned Numbers Authority) practices.

Whereas, the IDNC (Internationalized Domain Name) Working Group’s high-level recommendations require implementation planning.

Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) is looking closely at interaction with the final IDN ccTLD (Country Code Top Level Domain) PDP (Policy Development Process) process and potential risks, and intends to implement IDN ccTLDs using a procedure that will be resilient to unforeseen circumstances.

Whereas, staff will consider the full range of implementation issues related to the introduction of IDN ccTLDs associated with the ISO (International Organization for Standardization) 3166-1 list, including means of promoting adherence to technical standards and mechanisms to cover the costs associated with IDN ccTLDs.

Whereas, the Board intends that the timing of the process for the introduction of IDN ccTLDs should be aligned with the process for the introduction of New gTLDs.

Resolved (2008.06.26.04), the Board thanks the members of the IDNC (Internationalized Domain Name) WG (Working Group) for completing their chartered tasks in a timely manner.

Resolved (2008.06.26.05), the Board directs staff to: (1) post the IDNC (Internationalized Domain Name) WG (Working Group) final report for public comments; (2) commence work on implementation issues in consultation with relevant stakeholders; and (3) submit a detailed implementation report including a list of any outstanding issues to the Board in advance of the ICANN (Internet Corporation for Assigned Names and Numbers) Cairo meeting in November 2008.

GNSO (Generic Names Supporting Organization) Recommendation on Domain Tasting

Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) community stakeholders are increasingly concerned about domain tasting, which is the practice of using the add grace period (AGP (Add Grace Period)) to register domain names in bulk in order to test their profitability.

Whereas, on 17 April 2008, the GNSO (Generic Names Supporting Organization) Council approved, by a Supermajority vote, a motion to prohibit any gTLD (generic Top Level Domain) operator that has implemented an AGP (Add Grace Period) from offering a refund for any domain name deleted during the AGP (Add Grace Period) that exceeds 10% of its net new registrations in that month, or fifty domain names, whichever is greater. <http://gnso.icann.org/meetings/minutes-gnso-17apr08.shtml>

Whereas, on 25 April 2008, the GNSO (Generic Names Supporting Organization) Council forwarded its formal “Report to the ICANN (Internet Corporation for Assigned Names and Numbers) Board - Recommendation for Domain Tasting”
Whereas, the Board is also considering the Proposed FY 09 Operating Plan and Budget <http://www.icann.org/financials/fiscal-30jun09.htm>, which includes (at the encouragement of the GNSO (Generic Names Supporting Organization) Council) a proposal similar to the GNSO (Generic Names Supporting Organization) policy recommendation to expand the applicability of the ICANN (Internet Corporation for Assigned Names and Numbers) transaction fee in order to limit domain tasting.

Resolved (2008.06.26.06), the Board adopts the GNSO (Generic Names Supporting Organization) policy recommendation on domain tasting, and directs staff to implement the policy following appropriate comment and notice periods on the implementation documents.

Approval of Operating Plan and Budget for Fiscal Year 2008-2009

 Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) approved an update to the Strategic Plan in December 2007. <http://www.icann.org/strategic-plan/>

 Whereas, the Initial Operating Plan and Budget Framework for fiscal year 2009 was presented at the New Delhi ICANN (Internet Corporation for Assigned Names and Numbers) meeting and was posted in February 2008 for community consultation. <http://www.icann.org/announcements/announcement-2-04feb08.htm>

 Whereas, community consultations were held to discuss and obtain feedback on the Initial Framework.

 Whereas, the draft FY09 Operating Plan and Budget was posted for public comment in accordance with the Bylaws on 17 May 2008 based upon the Initial Framework, community consultation, and consultations with the Board Finance Committee. A slightly revised version was posted on 23 May 2008. <http://www.icann.org/financials/fiscal-30jun09.htm>

 Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) has actively solicited community feedback and consultation with ICANN (Internet Corporation for Assigned Names and Numbers)'s constituencies. <http://forum.icann.org/lists/op-budget-fy2009/>

 Whereas, the ICANN (Internet Corporation for Assigned Names and Numbers) Board Finance Committee has discussed, and guided staff on, the FY09 Operating Plan and Budget at each of its regularly scheduled monthly meetings.

 Whereas, the final FY09 Operating Plan and Budget was posted on 26 June 2008. <http://www.icann.org/en/financials/proposed-opplan-budget-v3-fy09-25jun08-en.pdf>
Whereas, the ICANN (Internet Corporation for Assigned Names and Numbers) Board Finance Committee met in Paris on 22 June 2008 to discuss the FY09 Operating Plan and Budget, and recommended that the Board adopt the FY09 Operating Plan and Budget.

Whereas, the President has advised that the FY09 Operating Plan and Budget reflects the work of staff and community to identify the plan of activities, the expected revenue, and resources necessary to be spent in fiscal year ending 30 June 2009.

Whereas, continuing consultation on the budget has been conducted at ICANN (Internet Corporation for Assigned Names and Numbers)'s meeting in Paris, at constituency meetings, and during the public forum.

Update on Draft Amendments to the Registrar Accreditation Agreement
(For discussion only.)

Approval of PIR Request to Implement DNSSEC (DNS Security Extensions) in .ORG

Whereas, Public Interest Registry has submitted a proposal to implement DNS (Domain Name System) Security (Security – Security, Stability and Resiliency (SSR)) Extensions (DNSSEC (DNS Security Extensions)) in .ORG. <http://icann.org/registries/rsep/pir-request-03apr08.pdf (http://icann.org/registries/rsep/pir-request-03apr08.pdf)>

Whereas, staff has evaluated the .ORG DNSSEC (DNS Security Extensions) proposal as a new registry service via the Registry Services Evaluation Policy <http://icann.org/registries/rsep/ (http://icann.org/registries/rsep/), and the proposal included a requested amendment to Section 3.1(c)(i) of the .ORG Registry Agreement <http://icann.org/tlds/agreements/org/proposed-org-amendment-23apr08.pdf (http://icann.org/tlds/agreements/org/proposed-org-amendment-23apr08.pdf)> which was posted for public comment along with the PIR proposal.

Whereas, the evaluation under the threshold test of the Registry Services Evaluation Policy <http://icann.org/registries/rsep/rsep.html (http://icann.org/registries/rsep/rsep.html)> found a likelihood of security and stability issues associated with the proposed implementation. The RSTEP (Registry Services Technical Evaluation Panel) Review Team considered the proposal and found that there was a risk of a meaningful adverse effect on security and stability, which could be effectively mitigated by policies, decisions and actions to which PIR has expressly committed in its proposal or could be reasonably required to commit. <http://icann.org/registries/rsep/rstep-report-pir-dnssec-04jun08.pdf (http://icann.org/registries/rsep/rstep-report-pir-dnssec-04jun08.pdf)>
Whereas, the Chair of the SSAC (Security and Stability Advisory Committee) has advised that RSTEP (Registry Services Technical Evaluation Panel)'s thorough investigation of every issue that has been raised concerning the security and stability effects of DNSSEC (DNS Security Extensions) deployment concludes that effective measures to deal with all of them can be taken by PIR, and that this conclusion after exhaustive review greatly increases the confidence with which DNSSEC (DNS Security Extensions) deployment in .ORG can be undertaken.

Whereas, PIR intends to implement DNSSEC (DNS Security Extensions) only after extended testing and consultation.

Resolved (2008.06.26.08), that PIR's proposal to implement DNSSEC (DNS Security Extensions) in .ORG is approved, with the understanding that PIR will continue to cooperate and consult with ICANN (Internet Corporation for Assigned Names and Numbers) on details of the implementation. The President and the General Counsel are authorized to enter the associated amendment to the .ORG Registry Agreement, and to take other actions as appropriate to enable the deployment of DNSSEC (DNS Security Extensions) in .ORG.

ICANN (Internet Corporation for Assigned Names and Numbers) Board of Directors' Code of Conduct

Whereas, the members of ICANN (Internet Corporation for Assigned Names and Numbers)'s Board of Directors are committed to maintaining a high standard of ethical conduct.

Whereas, the Board Governance Committee has developed a Code of Conduct to provide the Board with guiding principles for conducting themselves in an ethical manner.

Resolved (2008.06.26.09), the Board directs staff to post the newly proposed ICANN (Internet Corporation for Assigned Names and Numbers) Board of Directors' Code of Conduct for public comment, for consideration by the Board as soon as feasible. [Reference to PDF will be inserted when posted.]

Ratification of Selection of Consultant to Conduct Independent Review of the Board

Whereas, the Board Governance Committee has recommended that Boston Consulting Group be selected as the consultant to perform the independent review of the ICANN (Internet Corporation for Assigned Names and Numbers) Board.

Whereas, the BGC's recommendation to retain BCG was approved by the Executive Committee during its meeting on 12 June 2008.

Resolved (2008.06.26.10), the Board ratifies the Executive Committee's approval of the Board Governance Committee's recommendation to select Boston Consulting Group as the consultant to perform the independent review of the ICANN (Internet Corporation for Assigned Names and Numbers) Board.
Appointment of Independent Review Working Groups

Whereas, the Board Governance Committee has recommended that several working groups should be formed to coordinate pending independent reviews of ICANN (Internet Corporation for Assigned Names and Numbers) structures.

Resolved (2008.06.26.11), the Board establishes the following independent review working groups:

- ICANN (Internet Corporation for Assigned Names and Numbers) Board Independent Review Working Group: Amadeu Abril i Abril, Roberto Gaetano (Chair), Steve Goldstein, Thomas Narten, Rajasekhar Ramaraj, Rita Rodin, and Jean Jacques Subrenat.

- DNS (Domain Name System) Root Server System Advisory Committee (Advisory Committee) (RSSAC (Root Server System Advisory Committee)) Independent Review Working Group: Harald Alvestrand (Chair), Steve Crocker and Bruce Tonkin.

Update on Independent Reviews of ICANN (Internet Corporation for Assigned Names and Numbers) Structures

(For discussion only.)

Board Committee Assignment Revisions

Whereas, the Board Governance Committee has recommended that the membership of several Board should be revised, and that all other committees should remain unchanged until the 2008 Annual Meeting.

Resolved (2008.06.26.12), the membership of the Audit, Finance, and Reconsideration committees are revised as follows:

- Audit Committee: Raimundo Beca, Demi Getschko, Dennis Jennings, Njeri Rionge and Rita Rodin (Chair).

- Finance Committee: Raimundo Beca, Peter Dengate Thrush, Steve Goldstein, Dennis Jennings, Rajasekhar Ramaraj (Chair), and Bruce Tonkin (as observer).

- Reconsideration Committee: Susan Crawford (Chair), Demi Getschko, Dennis Jennings, Rita Rodin, and Jean-Jacques Subrenat.
Approval of BGC Recommendations on GNSO (Generic Names Supporting Organization) Improvements

Whereas, Article IV, Section 4 of ICANN (Internet Corporation for Assigned Names and Numbers)’s Bylaws calls for periodic reviews of the performance and operation of ICANN (Internet Corporation for Assigned Names and Numbers)’s structures by an entity or entities independent of the organization under review.

Whereas, the Board created the “Board Governance Committee GNSO (Generic Names Supporting Organization) Review Working Group” (Working Group) to consider the independent review of the GNSO (Generic Names Supporting Organization) and other relevant input, and recommend to the Board Governance Committee a comprehensive proposal to improve the effectiveness of the GNSO (Generic Names Supporting Organization), including its policy activities, structure, operations and communications.

Whereas, the Working Group engaged in extensive public consultation and discussions, considered all input, and developed a final report containing a comprehensive and exhaustive list of proposed recommendations on GNSO (Generic Names Supporting Organization) improvements.

Whereas, the Board Governance Committee determined that the GNSO (Generic Names Supporting Organization) Improvements working group had fulfilled its charter and forwarded the final report to the Board for consideration.

Whereas, a public comment forum was held open for 60 days to receive, consider and summarize public comments on the final report.

Whereas, the GNSO (Generic Names Supporting Organization) Council and Staff have worked diligently over the past few months to develop a top-level plan for approaching the implementation of the improvement recommendations, as requested by the Board at its New Delhi meeting.

Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) has a continuing need for a strong structure for developing policies that reflect to the extent possible a consensus of all stakeholders in the community including ICANN (Internet Corporation for Assigned Names and Numbers)’s contracted parties.

Resolved (2008.06.26.13), the Board endorses the recommendations of the Board Governance Committee’s GNSO (Generic Names Supporting Organization) Review Working Group, other than on GNSO (Generic Names Supporting Organization) Council restructuring, and requests that the GNSO (Generic Names Supporting Organization) convene a small working group on Council restructuring including one representative from the current NomCom appointees, one member from each constituency and one member from each liaison-appointing advisory committee (if that advisory committee so desires), and that this group should reach consensus and submit a consensus recommendation on Council restructuring by no later than 25 July 2008 for consideration by the ICANN (Internet Corporation for Assigned Names and Numbers)
Numbers) Board as soon as possible, but no later than the Board's meeting in August 2008.

Receipt of Report of President's Strategy Committee Consultation

Whereas, the Chairman of the Board requested that the President's Strategy Committee undertake a process on how to strengthen and complete the ICANN (Internet Corporation for Assigned Names and Numbers) multi-stakeholder model.

Whereas, the PSC has developed three papers that outline key areas and possible responses to address them: "Transition Action Plan;" "Improving Institutional Confidence in ICANN (Internet Corporation for Assigned Names and Numbers);" and "FAQ." <http://icann.org/en/announcements/announcement-16jun08-en.htm>

Whereas, these documents and the proposals contained in them have been discussed at ICANN (Internet Corporation for Assigned Names and Numbers)'s meeting in Paris.

Whereas, a dedicated webpage has been launched to provide the community with information, including regular updates <http://icann.org/jpa/iic/ >.

Resolved (2008.06.26.14), the Board thanks the President's Strategy Committee for its work to date, and instructs ICANN (Internet Corporation for Assigned Names and Numbers) staff to undertake the public consultation recommended in the action plan, and strongly encourages the entire ICANN (Internet Corporation for Assigned Names and Numbers) community to participate in the continuing consultations on the future of ICANN (Internet Corporation for Assigned Names and Numbers) by reviewing and submitting comments to the PSC by 31 July 2008.

Selection of Mexico City for March 2009 ICANN (Internet Corporation for Assigned Names and Numbers) Meeting

Whereas, ICANN (Internet Corporation for Assigned Names and Numbers) intends to hold its first meeting for calendar year 2009 in the Latin America region;

Whereas, the Mexican Internet Association (AMIPCI) has agreed to host the meeting;

Resolved (2008.06.26.15), the Board accepts the AMIPCI proposal to host ICANN (Internet Corporation for Assigned Names and Numbers)'s 34th global meeting in Mexico City, in March 2009.

Review of Paris Meeting Structure

(For discussion only.)
ICANN (Internet Corporation for Assigned Names and Numbers) At-Large Summit Proposal

Whereas, at the ICANN (Internet Corporation for Assigned Names and Numbers) meeting in New Delhi in February 2008, the Board resolved to direct staff to work with the ALAC (At-Large Advisory Committee) to finalise a proposal to fund an ICANN (Internet Corporation for Assigned Names and Numbers) At-Large Summit, for consideration as part of the 2008-2009 operating plan and budget process. <http://www.icann.org/minutes/resolutions-15feb08.htm>

Whereas, potential funding for such a summit has been identified in the FY09 budget. <http://www.icann.org/financials/fiscal-30jun09.htm>

Whereas, a proposal for the Summit was completed and submitted shortly before the ICANN (Internet Corporation for Assigned Names and Numbers) Meeting in Paris.

Resolved (2008.06.26.16), the Board approves the proposal to hold an ICANN (Internet Corporation for Assigned Names and Numbers) At-Large Summit as a one-time special event, and requests that the ALAC (At-Large Advisory Committee) work with ICANN (Internet Corporation for Assigned Names and Numbers) Staff to implement the Summit in a manner that achieves efficiency, including considering the Mexico meeting as the venue.

Resolved (2008.06.26.17), with the maturation of At-Large and the proposal for the At-Large Summit’s objectives set out, the Board expects the ALAC (At-Large Advisory Committee) to look to more self-funding for At-Large travel in the fiscal year 2010 plan, consistent with the travel policies of other constituencies.

Other Business

(TBD)

Thanks to Steve Conte

Whereas, Steve Conte has served as an employee of ICANN (Internet Corporation for Assigned Names and Numbers) for over five years.

Whereas, Steve has served ICANN (Internet Corporation for Assigned Names and Numbers) in a number of roles, currently as ICANN (Internet Corporation for Assigned Names and Numbers)'s Chief Security (Security – Security, Stability and Resiliency (SSR)) Officer, but also as a vital support to the Board and its work at meetings.

Whereas, Steve has given notice to ICANN (Internet Corporation for Assigned Names and Numbers) that he has accepted a new position with the Internet Society (ISOC (Internet Society)), and that his employment with ICANN (Internet Corporation for Assigned Names and Numbers) will conclude at the end of this meeting.
Whereas, Steve is of gentle nature, possessed of endless patience and fierce integrity, a love of music, and great dedication to the Internet and those who nurture it.

Whereas, the ICANN (Internet Corporation for Assigned Names and Numbers) Board wishes to recognize Steve for his service to ICANN (Internet Corporation for Assigned Names and Numbers) and the global Internet community. In particular, Steve has tirelessly and with good nature supported the past 19 ICANN (Internet Corporation for Assigned Names and Numbers) meetings and his extraordinary efforts have been most appreciated.

Resolved (2008.06.26.18), the ICANN (Internet Corporation for Assigned Names and Numbers) Board formally thanks Steve Conte for his service to ICANN (Internet Corporation for Assigned Names and Numbers), and expresses its good wishes to Steve for his work with ISOC (Internet Society) and all his future endeavors.

Thanks to Sponsors

The Board extends its thanks to all sponsors of this meeting:

Thanks to Local Hosts, Staff, Scribes, Interpreters, Event Teams, and Others

The Board wishes to extend its thanks to the local host organizers, AGIFEM, its President Daniel Dardailler, Vice-President Pierre Bonis and CEO Sebastien Bachollet, as well as Board Members from Afnic, Amen, Domaine.fr, Eurodns, Indom, Internet Society France, Internet fr, Namebay, Renater, and W3C (World Wide Web Consortium).
The Board would also like to thank Eric Besson, the Minister for Forward Planning, Assessment of Public Policies and Development of the Digital Economy for his participation in the Welcome Ceremony and the Welcome Cocktail.

The Board thanks the Au Toit de la Grande Arche, its president, Francis Bouvier, and Directeur, Philippe Nieuwbourg, and Bertrand Delanoë, Maire de Paris, and Jean-Louis Missika, adjoint au Maire de Paris for their hospitality at the social events at the ICANN (Internet Corporation for Assigned Names and Numbers) Paris meeting.

The Board expresses its appreciation to the scribes Laura Brewer, Teri Darrenougue, Jennifer Schuck, and Charles Motter and to the entire ICANN (Internet Corporation for Assigned Names and Numbers) staff for their efforts in facilitating the smooth operation of the meeting. ICANN (Internet Corporation for Assigned Names and Numbers) would particularly like to acknowledge the many efforts of Michael Evans for his assistance in organizing the past eighteen public board meetings and many other smaller events for the ICANN (Internet Corporation for Assigned Names and Numbers) community.

The Board also wishes to express its appreciation to VeriLan Events Services, Inc. for technical support, Auvitec and Prosn for audio/visual support, Calliope Interpreters France for interpretation, and France Telecom for bandwidth. Additional thanks are given to the Le Meridien Montparnasse for this fine facility, and to the event facilities and support.

The Board also wishes to thank all those who worked to introduce a Business Access Agenda for the first time at this meeting, Ayesha Hassan of the International Chamber of Commerce, Marilyn Cade, and ICANN (Internet Corporation for Assigned Names and Numbers) Staff.

The members of the Board wish to especially thank their fellow Board Member Jean-Jacques Subrenat for his assistance in making the arrangements for this meeting in Paris, France.
Annex B

GAC comments on the new gTLD Program: Draft Applicant Guidebook
(posted 24 October 2008)

As stated as early as 1999 in its GAC Operating Principles, and subsequently in its Principles on ccTLDs and Principles on new gTLDs, the GAC considers that the Internet naming and addressing system is a public resource that must be managed in the interests of the global Internet community.

The GAC’s main concern is to ensure that the careful expansion of the domain name space does not cause any threat to the stability and security of the Internet. This is a strategic issue for the future of the DNS and its contribution to the global information society.

The introduction of new gTLDs must therefore be viewed as a means to enhance the social and economic value of the name space. It should be conducted with a view to provide benefits for the users, while respecting the legitimate rights and expectations of other stakeholders, and reducing the risks of confusion or market distortions. It should pay attention to a fair and equitable treatment of not only applicants but the affected communities.

In this context, the GAC wishes to provide the following comments in the perspective of further community-wide discussions:

**General vision of the Domain Name Space**

ICANN’s bylaws contain as a core value “the introduction and promotion of competition in the registration of domain names where practicable and beneficial in the public interest”.

In this context, the GAC considers that the study requested by the Board in its meeting of October 18, 2006, on “economic questions relating to the domain registration market” and particularly on “whether the domain registration market is one market or whether each TLD functions as a separate market” would have provided useful insights to develop a common vision within the whole Internet community and a needed reference framework for many of the pending issues regarding the introduction of new gTLDs.

In the absence of such a study, key decisions and stakeholder responses remain ill-informed about market and competition issues associated with the planned broad expansion of the domain space. For this reason, the GAC recommends that the requested study be completed as soon as possible to allow the ICANN community to make informed decisions about this important issue.

**Limits of the single-fee structure**

The GAC has concerns about the proposed single fee structure and its deterrent effect on the prospective proposals for new domains emanating from innovative SME or developing countries, as well as those serving non-commercial purposes.

GAC Communiqué—Mexico City
In particular, it is likely that some proposals addressing specific cultural, linguistic, local or regional communities may not be able to afford the entry costs and recurring costs envisaged in the current framework. Many countries and territories have significant linguistic and cultural minorities who stand to benefit from an Internet tailored to their particular needs with a DNS reflecting their particular cultural and social needs and aspirations. ICANN should give urgent consideration to the immense potential for social and cultural exploitation of gTLDs both in Latin and other scripts.

The GAC proposes therefore that consideration be given to the introduction of a new type of TLD which could be designated in the new gTLD round, the scTLD – social and cultural TLD which would be designed to address the needs and interests of a clearly defined social and/or cultural community and would essentially be non-commercially based. The GAC would be willing to discuss with other stakeholders the characteristics that such a new class of TLDs might have.

Fee level and management of surplus

The GAC notes a lack of transparency about cost evaluation principles applied in determining the current fee level and how these compare with previous new gTLD Rounds. In this context, GAC recalls that the fee structure should also encourage a level playing field between new applicants and incumbent gTLD operators, especially for those new gTLDs that will be commercially run. High start-up costs mean higher initial prices for registrants and a greater risk of failure for the registry, which would be prejudicial both to competition and stability. The GAC fears the current fee level will not be conducive to innovation and will unduly favour well-financed applicants and purely commercial proposals.

Moreover, and in line with GAC comments on the PSC report regarding the general budget of ICANN, community consensus should be sought on appropriate uses for any revenue surplus.

Importance of contract compliance

It is essential that ICANN show sufficient capacity to enforce contract compliance of both existing and new registries, and indicates how it intends to do so.

Reducing the cost to business (defensive registration)

The GAC shares the concerns of business stakeholders about a range of overarching issues relating to overall costs to business. In particular efforts should be made to help limit the need for defensive registrations in the new gTLDs.

This also includes ensuring that registries provide appropriate mechanisms to prevent fraudulent registrations. The GAC believes it is important to gain a clear understanding of the views of the business community on those issues.
**Auctions versus Competitive bidding**

Auctions have been used in the past by governments to allocate public resources (with revenues accruing to public finances) but as a private sector corporation, ICANN is an unusual position regarding its "gate-keeper" function for the Domain Name System. The GAC questions whether it would be appropriate for ICANN to select operators for new gTLDs based on auctions in which the bidders are required to compete by offering to pay ICANN the highest possible fee for the right to operate a new gTLD registry.

**IDNs**

The introduction of domain names in non-Latin scripts is a fundamental development of the Domain Name Space, necessary to fulfill the vision of an Internet accessible to everybody in his/her own language.

In view of the explicitly manifested need in some countries which are not using Latin script, the GAC believes it remains crucially important to progress the IDN ccTLD fast track successfully to implementation in 2009.

**Geographic names**

The GAC expects ICANN to apply GAC gTLD principles in respect to the handling of geographic names and in particular principles 2.2\(^1\) (including place names) and 2.7\(^2\) that are not comprehensively addressed in the implementation proposals.

Strings being meaningful representations or abbreviations of a country and territory name in any script or language should not be allowed in the gTLD space until the related IDN ccTLD policy development processes have been completed.

The proposed introduction of new gTLDs and in particular any process relating to the protection of geographic names should not result in an unreasonable administrative burden for government administrations.

These views relate to the GAC's analysis of the Draft Applicant Guidebook posted by ICANN staff on 23 October 2008. The GAC will seek to provide ICANN with any additional comments it feels appropriate on the Draft Applicant Guidebook version 2 posted on 18 February 2009 before or during its meeting in Sydney.

---

\(^1\) ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities.

\(^2\) Principle 2.7 states: “Applicant registries for new gTLDs should pledge to: a) adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new gTLD; b) to ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.”
New gTLD Program

New gTLD Program in Brief

Since ICANN was founded in 1998 as a not-for-profit, multi-stakeholder organization dedicated to coordinating the Internet’s addressing system, one of its foundational principles has been to promote competition in the domain name marketplace while ensuring Internet security and stability. The expansion of the generic top-level domains (gTLDs) will allow for more innovation, choice and change to the Internet’s addressing system, now represented by 21 gTLDs.

The decision to introduce new gTLDs followed a detailed and lengthy consultation process with all constituencies of the global Internet community represented by a wide variety of stakeholders – governments, individuals, civil society, business and intellectual property constituencies, and the technology community. Also contributing to this policy work were ICANN’s Governmental Advisory Committee (GAC), At-Large Advisory Committee (ALAC), Country Code Names Supporting Organization (ccNSO), and Security and Stability Advisory Committee (SSAC). The policy was completed by the Generic Names Supporting Organization (GNSO) in 2007, and adopted by ICANN’s Board in June, 2008. The program is expected to launch in calendar year 2010.

The ICANN team continues to share with the Internet community the ongoing program developments through the release of draft Applicant Guidebooks, excerpts, explanatory memoranda and in-person meetings. All details can be found on this page.

In a world with over 1.6 billion Internet users – and growing – diversity, choice and competition are key to the continued success and reach of the global network.

New gTLD History at a Glance

- Eight gTLDs predated ICANN’s creation – dot-com, dot-edu, dot-gov, dot-int, dot-mil, dot-net, dot-org and dot-arpa.
- ICANN has successfully carried out two previous application rounds for new gTLDs: 2000 (dot-aero, dot-biz, dot-coop, dot-info, dot-museum, dot-name and dot-pro) and 2004 (dot-asia, dot-cat, dot-jobs, dot-mobi, dot.tel, dot-travel).
- The Generic Names Supporting Organization (GNSO) has developed policy recommendations that are the foundation guiding ICANN in introducing new gTLDs. The policy work started in December 2005 and concluded in September 2007.
- In June 2008, during ICANN’s Paris meeting, ICANN Board approved the GNSO recommendations for introducing New gTLDs to the Internet’s addressing system.

Fast Facts

- According to Internet World Stats, there are an estimated 1.6 billion Internet users worldwide.
- An Internet address is made up of a series of characters separated by dots. For example, in the website address www.icann.org, the top-level domain is “org” and the second-level domain is “icann”. In some cases, you can also find third-level domain names.
- There are currently 21 gTLDs. A gTLD can, in some cases, identify the nature of an organization operating a specific website. For example, a website with a dot-com address usually indicates a commercial organization: dot-museum is dedicated to museums, dot-mobi for mobile phone users, dot-aero for the aviation industry, and so on.
- There are around 250 two-letter country-code TLDs (ccTLDs), which identify a country or territory. For example, the Internet extension dot-jp corresponds to Japan, while dot-eu corresponds to the European Union.
- The year 2008 ended with a total base of 177 million domain name registrations across all of the top-level domains (TLDs). This represents 16 percent growth over the previous year and 2 percent growth over the third quarter of 2008. Of the 177 million second-level domain name registrations, 96 million are gTLD registrations.

Did you know?

- The Internet Corporation for Assigned Names and Numbers (ICANN) is responsible for introducing new generic top-level domains (gTLDs). The priority is to ensure that new gTLDs are awarded in a fair and transparent process to organizations that can effectively manage them on behalf of Internet users.
- ICANN is currently developing the program that facilitates the creation of new Internet extensions, or gTLDs. Under this new process, more extensions will be created, and with them, potentially a whole new way of using the Internet. Also, for the first time, Internationalized Domain Names (IDNs) will be available at the top level, enabling new extensions in different scripts such as Arabic, Chinese, Greek, Hindi, and more. Millions of people around the world will be able to use the Internet’s naming system in their own languages.
- The Internet’s fundamental protocol – TCP/IP – has passed its 30th birthday, and the naming system on top of it – DNS – has passed its 25th birthday. The Internet has gone from a few networked computers to a network accessed by a billion people, from a Western phenomenon to a truly global one, and from research roots to an engine of commerce accounting for trillions of dollars in commerce.
- During that time, the use of top-level domain (TLD) identifiers, such as dot-com, dot-net, dot-uk, has actually changed very little. The most widely recognized global TLD is dot-com. While the scale of these TLDs has changed dramatically since their inception – more than 20 years ago for dot-com – the availability and usage of these top-level names has been permitted to change very little.
- The entity responsible for operating a gTLD is called a registry. Depending on the kind of gTLD, these organizations are referred to as registry operators or sponsors. New gTLD registries must sign agreements with ICANN to meet technical requirements and comply with applicable policies.
What are gTLDs?
gTLD stands for generic top-level domain – what Internet users see as an Internet extension like dot-com, dot-org or dot-info – and they are part of the structure of the Internet’s domain name system.

Why are new gTLDs being introduced?
The wider Internet community that takes part in the ICANN policy development process has advocated for new gTLDs. Since it was founded in 1998, one of ICANN’s key mandates has been to create competition in the domain name market.

In addition the Joint Project Agreement that ICANN has with the US Department of Commerce says, “ICANN shall maintain and build on processes to ensure that competition, consumer interests, and Internet DNS stability and security issues are identified and considered in TLD management decisions, including the consideration and implementation of new TLDs.”

Opening the top-level space so that names can be proposed rather than be restricted to the existing 21 gTLDs could open up a new wave of innovation. Competition and innovation best occur when a stable and open platform is available and the barriers to entry are reduced.

Will this change how the Internet operates?
This planned increase of the number of gTLDs is not expected to affect the way the Internet operates, but it will potentially change the way people find information on the Internet.

What is ICANN doing to protect trademark holders?
First, an objection-based process will enable rightsholders to demonstrate that a proposed gTLD would infringe their legal rights. Second, applicants for new gTLDs will be required to describe in their applications the rights protection mechanism they propose for second-level registrations, which must be made public. Third, all new gTLDs must ensure that second-level registrations are subject to ICANN’s Uniform Domain Name Dispute Resolution Policy (UDRP), a process that has worked well to protect rights for many years. Finally, ICANN has been working closely with the trademark community to find additional solutions to potential issues for trademark holders in implementing new gTLDs.

Will ICANN prevent the registration of objectionable or racist extensions?
Offensive names could be subject to an objection-based process based on public morality and order. This process will be conducted by an international arbitration body using criteria drawing on provisions in a number of international treaties.

How are IDNs related to gTLDs?
IDN is the short name for Internationalized Domain Name. IDNs are domain names with characters in addition to a, b,…, z; 0, 1,…, 9; and “-“.

Such domain names could contain characters with diacritical marks as required by many European languages, or characters from non-Latin scripts; for example, Arabic or Chinese. During the 2010 application round, IDN gTLDs will be allowed for the first time in the history of the Internet. The IDN top-level domain names will offer many new opportunities and benefits for Internet users around the world by allowing them to establish and use top-level domains in their native languages and scripts.

How many new gTLDs are expected?
There is no way of knowing the exact number of applications ICANN will receive during the 2010 application round or how many of these applications will qualify and become gTLD registries. Market speculations have estimated anything from hundreds to thousands of applications.

Is applying for a new gTLD the same as buying a domain name?
No. Nowadays, organizations and individuals around the world can buy second-level and, in some cases, even third-level domain names. They simply need to find an accredited registrar or reseller, comply with the registrant terms and conditions and pay annual fees. The application for a new gTLD is a much more complex process. An applicant for a new gTLD is, in fact, applying to create and operate a registry business and sign a contract with ICANN.

Can I register my idea for a new gTLD with ICANN in advance of the next application period?
No, ICANN will not be taking reservations or pre-registrations of new gTLDs.

Can I simply reserve a gTLD and decide later whether or not to use it?
One of the reasons ICANN is opening the top-level space is to allow for competition and innovation in the marketplace. The application process requires applicants to provide a detailed plan for the launch and operations of the proposed gTLD. ICANN expects new gTLDs to be operational shortly after the registry agreement is signed.

How and when can I see which TLDs are being applied for and who is behind the applications?
After the application period is closed, ICANN will verify all applications for completeness and then release on its website the list of TLDs, applicant names and nonconfidential information about the applications.

Is this the only opportunity to apply for a new gTLD?
No. ICANN plans to hold additional rounds in the future. The exact dates for these future rounds are not yet available. “Applicants who are unsuccessful may re-apply in future rounds.”

Can I register my idea for a new gTLD with ICANN in advance of the next application period?
No, ICANN will not be taking reservations or pre-registrations of new gTLDs.

Can I simply reserve a gTLD and decide later whether or not to use it?

Is this the only opportunity to apply for a new gTLD?
No. ICANN plans to hold additional rounds in the future. The exact dates for these future rounds are not yet available. “Applicants who are unsuccessful may re-apply in future rounds.”
Application Process

Who can apply for a new gTLD?
Any public or private organization from any part of the world can apply to create and operate a new gTLD. Applicants will need to demonstrate the operational, technical and financial capability to run a registry and comply with additional specific requirements.

What is the New gTLD Applicant Guidebook?
The Applicant Guidebook is a step-by-step guide for future applicants for a new gTLD to understand what to expect during the application and evaluation periods and how the process works. Since late 2008, the Applicant Guidebook has been released in drafts posted for public comment. This is part of ICANN’s bottom-up decision-making model and is a great opportunity for the Internet community to weigh in on the final set of criteria and processes. The final Applicant Guidebook is expected in 2010 and will contain a definitive set of rules and requirements.

Why is ICANN asking for so much information from the applicants?
One of ICANN’s core missions is to preserve the security, stability and global interoperability of the Internet. Future new gTLD registries are expected to comply with ICANN’s contract and follow all best practices and standards to ensure this mission is fulfilled.

Can I apply for more than one gTLD?
Yes. However, each application will be treated individually and there is no discounted application fee.

Can I apply for any kind of gTLD or are there any specific restrictions?
ICANN has a set of specific rules for gTLD strings that each applicant must carefully consider. For example, an application for a gTLD composed of numbers only will be rejected. Applicants for IDN gTLDs must carefully follow the additional technical specifications for IDNs outlined in the Applicant Guidebook.

Applicants representing a community-based TLD or a geographic TLD must meet additional specific requirements.

What will happen during the application period and how long will it take?
The application period will likely last for several weeks. Applicants will use a dedicated interface named TAS (TLD Application System) to answer questions about the applied-for TLD and their business and technical capability to operate a registry. The interface will also allow applicants to upload supporting documents and serve as a tracking and workflow management tool for ICANN staff, applicants and the various service providers supporting the evaluation or objection processes.

What happens if there are other applications for the same gTLD?
ICANN does not allow for two or more identical gTLDs. If there are two or more applications for the same gTLD, applicants will be required to follow the string contention procedures outlined in the Applicant Guidebook. Applicants should also be aware that the same specific rules will apply if two or more gTLD strings are considered to be highly similar by a panel of experts. The two processes proposed by ICANN to deal with the identical and similar gTLD applications are auctions and community priority (comparative) evaluation. The latter applies only in cases where there is a community-based applicant.

What can I do if someone applies for a gTLD that represents my brand or trademark?
ICANN will have a dispute resolution mechanism managed by a dispute resolution service provider (DRSP) that will process objections from third-parties that feel that their legal rights are being infringed upon.

Can third parties prevent an applicant from getting a new gTLD?
After the list of all gTLD applications is published on ICANN’s website, there will be an open objection period followed by established dispute resolution procedures. Objections can be filed only on four specific enumerated grounds. Details about these procedures, such as who has standing, where and how objections are filed, and how much objections will cost, among other, can be found in the Applicant Guidebook.

Timeline and Fees

When can I apply?
The application period is expected to take place in 2010. The application period will have specific open and close dates and times.

How much is the application fee?
The application fee is estimated at US$185,000. There is also a US$100 user registration fee to access the TAS. All applicants will be required to pay the same initial application and user registration fees. Various methods of payment will be accepted. Because an application might follow different paths, such as going through an objection or auction process, additional fees may apply to some applicants.

Will ICANN issue refunds?
Yes, refunds will apply in specific circumstances. Details about refund conditions are specified in the Applicant Guidebook.

Are there any ongoing fees once a gTLD is approved by ICANN?
Yes. Once an application successfully passes all evaluation steps, the applicant must sign a Registry Agreement with ICANN. Under the agreement, there are two fees: a fixed fee of US$6,250 per calendar quarter and a transaction fee of US$0.20 on future domain registrations and renewals.

The information presented here about the application and evaluation process is the most up-to-date available. However, it is a high-level summary and is subject to change. For exact details about the program please review the actual text of the Applicant Guidebook with the proposed Registry Agreement as it is being revised and finalized. For information about the New gTLD Program, please visit www.icann.org or email ICANN staff at newgtld@icann.org.

Where can I find more information?

For current information on the New gTLD Program, go to http://www.icann.org/en/topics/new-gtld-program.htm

To learn about GNSO Policy Development, go to http://gnso.icann.org/

To learn about IDNs, go to http://www.icann.org/en/topics/idn/

A full list of current gTLDs is available at http://www.icann.org/registries/listing.html
Glossary and useful terms

Applicant – an entity that has applied to ICANN for a new gTLD by submitting its application form through the online application system.

Application – an application for a new gTLD. An application includes the completed application form, any supporting documents and any other information that may be submitted by the applicant at ICANN’s request.

Applicant Guidebook – a step-by-step guide for future applicants for a new gTLD to understand what to expect during the application and evaluation periods and how the process works.

Auction – a method for allocating property or goods to the highest bidder.

Community priority (comparative) evaluation – a process to resolve string contention, which may be elected by a community-based applicant.

Community-based TLD – a community-based gTLD is one operated for the benefit of a defined community consisting of a restricted population. An applicant designating its application as community-based must be prepared to substantiate its status as representative of the community it names in the application.

TCP/IP – Transmission Control Protocol/Internet Protocol – the Internet’s basic communication language or protocol. The communications protocol underlying the Internet, IP allows large, geographically diverse networks of computers to communicate with each other quickly and economically over a variety of physical links. An IP address is the numerical address by which a location on the Internet is identified. Computers on the Internet use IP addresses to route traffic and establish connections among themselves; people generally use the human-friendly names made possible by the Domain Name System.

Objection – a formal objection filed with a dispute resolution service provider in accordance with that provider’s procedures.

DNS – Domain Name System – helps users find their way around the Internet. Every computer on the Internet has a unique address – just like a telephone number – which is a rather complicated string of numbers. It is called its IP address. IP addresses are hard to remember. The DNS makes using the Internet easier by allowing a familiar string of letters (the domain name) to be used instead of the arcane IP address. So instead of typing 207.151.159.3, you can type www.internic.net. It is a mnemonic device that makes addresses easier to remember.

DRSP – dispute resolution service provider – an entity engaged by ICANN to adjudicate dispute resolution proceedings in response to formally filed objections.

TAS – TLD Application System – the online interface for submitting applications to ICANN.

Registry – is the authoritative, master database of all domain names registered in each top-level domain. The registry operator keeps the master database and also generates the zone file that allows computers to route Internet traffic to and from top-level domains anywhere in the world.

Registry Agreement – the agreement executed between ICANN and successful gTLD applicants, which appears in draft form at http://www.icann.org/en/topics/new-gtds/.

Registrar – currently, a domain name in gTLDs can be registered with a registrar. The registrar can provide a variety of contact and technical information that makes up the domain name registration, keep records of the contact information and submit the technical information to a central directory, the registry. Registrants are required to enter a registration contract with the registrar that sets forth the terms under which the registration is accepted and will be maintained.

TLD – top-level domains are the names at the top of the DNS naming hierarchy. They appear in domain names as the string of letters following the last (rightmost) dot, such as “net” in “www.example.net.” The administrator for a TLD controls what second-level names are recognized in that TLD. The administrators of the root domain or root zone control what TLDs are recognized by the DNS. Commonly used TLDs include dot-com, dot-net, dot-edu, dot-jp, dot-de, and the like.

GAC – Governmental Advisory Committee – is an advisory committee composed of appointed representatives of national governments, multinational governmental organizations and treaty organizations, and distinct economies. Its function is to advise the ICANN Board on matters of concern to governments.

ALAC – At-Large Advisory Committee – considers and provides advice on the activities of the ICANN as they relate to the interests of individual Internet users.

ccNSO – Country-Code Names Supporting Organization – engages and provides leadership in activities relevant to country-code top-level domains (ccTLDs). This is achieved by developing policy recommendations to the ICANN Board, nurturing consensus across the ccNSO’s community, including the name-related activities of ccTLDs, and coordinating with other ICANN SOs, committees or ICANN constituencies.

SSAC – Security and Stability Advisory Committee – the standing committee on the security and stability of the Internet’s naming and address allocation systems. Its charter includes a focus on risk analysis and auditing. SSAC consists of approximately 20 technical experts from industry and academia as well as operators of Internet root servers, registrars and TLD registries.

GNSO – Generic Names Supporting Organization – one of ICANN’s supporting organizations, formed of six constituencies: commercial and business constituency, gTLD registry constituency, ISP constituency, non-commercial constituency, registrar constituency, and IP constituency.

ISP – Internet Service Provider – an ISP provides access to the Internet to organizations or individuals. These services may include web hosting, email, VoIP (voice over IP), and support for many other applications.

String – the set of characters comprising an applied-for gTLD.

String Contention – the scenario in which there is more than one qualified applicant for the same gTLD or for gTLDs that are so similar that user confusion would result if more than one were to be delegated to the root zone.

Script – a collection of symbols used for writing a language. There are three basic kinds of scripts. Alphabetic (Arabic, Cyrillic, Latin) has individual elements termed letters. Ideographic (Chinese) has elements that are ideographs. Syllabary (Hangul) has individual elements that represent syllables. The writing systems of most languages use only one script but there are exceptions. For example, Japanese uses four different scripts representing all three categories. Scripts that do not appear in the Unicode code chart are completely unavailable for inclusion in IDNs.

About ICANN

To reach another person on the Internet you have to type an address into your computer – a name or a number. That address has to be unique so computers know where to find each other. ICANN coordinates these unique identifiers across the world. Without that coordination we wouldn’t have one global Internet. ICANN was formed in 1998. It is a not-for-profit public-benefit corporation with participants from all over the world dedicated to keeping the Internet secure, stable and interoperable. It promotes competition and develops policy on the Internet’s unique identifiers. ICANN doesn’t control content on the Internet. It cannot stop spam and it doesn’t deal with access to the Internet. But through its coordination role on the Internet’s naming system, it does have an important impact on the expansion and evolution of the Internet. For more information please visit: www.icann.org.
As stated as early as 1999 in its GAC Operating Principles, and subsequently in its Principles on ccTLDs and Principles on new gTLDs, the GAC considers that the Internet naming and addressing system is a public resource that must be managed in the interests of the global Internet community.

The GAC’s main concern is to ensure that the careful expansion of the domain name space does not cause any threat to the stability and security of the Internet. This is a strategic issue for the future of the DNS and its contribution to the global information society.

The introduction of new gTLDs must therefore be viewed as a means to enhance the social and economic value of the name space. It should be conducted with a view to provide benefits for the users, while respecting the legitimate rights and expectations of other stakeholders, and reducing the risks of confusion or market distortions. It should pay attention to a fair and equitable treatment of not only applicants but the affected communities.

In this context, the GAC wishes to provide the following comments in the perspective of further community-wide discussions during the Mexico meeting.

**General vision of the Domain Name Space**

ICANN’s bylaws contain as a core value “the introduction and promotion of competition in the registration of domain names where practicable and beneficial in the public interest”.

In this context, the GAC considers that the study requested by the Board in its meeting of October 18, 2006, on “economic questions relating to the domain registration market” and particularly on “whether the domain registration market is one market or whether each TLD functions as a separate market” would have provided useful insights to develop a common vision within the whole Internet Community and a needed reference framework for many of the pending issues regarding the introduction of new gTLDs.

In the absence of such a study, key decisions and stakeholder responses remain ill-informed about market and competition issues associated with the planned broad expansion of the domain space. [For this reason, the GAC recommends that the Board should take steps to conduct such a study to allow the ICANN community to make informed decisions about this important issue].
Limits of the single-fee structure

The GAC has concerns about the proposed single fee structure and its deterrent effect on the prospective proposals for new domains emanating from innovative SME or developing countries, as well as those serving non-commercial purposes.

In particular, it is likely that some proposals addressing specific cultural, linguistic, local or regional communities may not be able to afford the entry costs and recurring costs envisaged in the current framework. Many countries and territories have significant linguistic and cultural minorities who stand to benefit from an Internet tailored to their particular needs with a DNS reflecting their particular cultural and social needs and aspirations. ICANN should give urgent consideration to the immense potential for social and cultural exploitation of gTLDs both in Latin and other scripts.

The GAC proposes therefore that consideration be given to the introduction of a new type of TLD which could already be designated in the new gTLD round, the scTLD – social and cultural TLD which would be essentially non-commercially based. The GAC would be willing to discuss with other stakeholders in Mexico the characteristics that such a new class of TLDs might have.

Fee level and management of surplus

The GAC notes a lack of transparency about cost evaluation principles applied in determining the current fee level and how these compare with previous new gTLD Rounds. In this context, GAC recalls that the fee structure should also encourage a level playing field between new applicants and incumbent gTLD operators, especially for those new gTLDs that will be commercially run. High start-up costs mean higher initial prices for registrants and a greater risk of failure for the registry, which would be prejudicial both to competition and stability. The GAC fears the current fee level will not be conducive to innovation and will unduly favour well-financed applicants and purely commercial proposals.

Moreover, and in line with GAC comments on the PSC report regarding the general budget of ICANN, community consensus should be sought on appropriate uses for any revenue surplus.

Importance of contract compliance

It is essential that ICANN show sufficient capacity to enforce contract compliance of both existing and new registries, and indicates how it intends to do so.

Reducing the need for defensive registrations

The GAC shares the concerns of business stakeholders about a range of overarching issues relating to overall costs to business. In particular efforts should be made to help limit the need for defensive registrations in the new gTLDs. [The GAC believes it is important to gain a clear understanding of the views of the business community on this issue].
This also includes ensuring that registries provide appropriate mechanisms to prevent fraudulent registrations.

**Auctions vs Competitive bidding**

Auctions [have been used in the past by governments to allocate scarce public resources (with revenues accruing to public finances) but as a private sector corporation, ICANN is an unusual position regarding its "gate-keeper" function for the Domain Name System and careful consideration needs to be given to whether auctions are an appropriate way to facilitate expansion of the TLD name space].

The GAC believes that alternative competitive bidding procedures and criteria should be explored to maximize the benefits for the global Internet community. As mentioned in the GAC principles on new gTLDs, “the evaluation and selection procedures for [the delegation of] new TLD registries should respect the principles of fairness, transparency and non-discrimination”.

**IDNs**

The introduction of domain names in non-Latin scripts is a fundamental development of the Domain Name Space, necessary to fulfill the vision of an Internet accessible to everybody in his/her own language.

In view of the explicitly manifested need in some countries which are not using Latin script, the GAC believes it remains crucially important to progress the IDN ccTLD fast track successfully to implementation in 2009. [The GAC appreciates and indeed initially supported the original rationale for the decision to try and link the two IDN processes but now feels that progress on IDN ccTLDs needs to be prioritised in light of the state of play regarding community discussions on new gTLDs.]

Moreover, regarding the new gTLD process, the GAC feels that more attention should be devoted to encouraging and facilitating the introduction of IDN gTLDs in this context, in order to guarantee a more balanced Domain Name space in each script.

**Geographic names**

The GAC expects ICANN to apply GAC gTLD principles in respect to the handling of geographic names and in particular principles 2.2 (including place names) and 2.7\(^1\) that are not comprehensively addressed in the implementation proposals.

---

\(^1\) Principle 2.7 states : “Applicant registries for new gTLDs should pledge to : a) adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new gTLD; b) to ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.”
The proposed introduction of new gTLDs and in particular any process relating to the protection of geographic names should not result in an unreasonable administrative burden for government administrations.

The GAC looks forward to receiving the ICANN Board’s detailed responses to this GAC submission during its upcoming meeting with the Board in Mexico City and believes the meeting in Mexico City should provide the opportunity for a community-wide discussion on those issues.

[The GAC also notes the substantive nature of some of the inputs received so far by ICANN in its public consultation process and the implications that this may have for the intended scheduling of the new gTLD round.]
22 September 2009

Janis Karklins
Chairman of the Governmental Advisory Committee
Ambassador of Latvia to France
via email: janis.karklins@icann.org

Dear Janis

Thank you for the GAC’s letter of 18 August, containing the GAC’s comments on version 2 of the Draft Applicant Guidebook. I appreciate the detailed consideration given by the GAC to the issue of new gTLDs. Outlined below is a detailed response to the GAC’s comments, which I trust the GAC will find useful. I look forward to the Board continuing discussions with the GAC in Seoul, on version 3 of the Draft Applicant Guidebook which will be published by the end of September 2009.

I. ICANN’S PREPAREDNESS FOR NEW gTLD ROUND

1. Scalability of gTLD Expansion and Stability of the Internet

The GAC is aware that many root server operators have raised concerns about the effect that a major expansion of the gTLD space would have on the stability of the Internet. The GAC considers that a controlled and prudent expansion of the DNS space is of primary importance for safeguarding the stability, security and interoperability of the Internet on which the global economy and social welfare relies so much.

The GAC notes that the SSAC and RSSAC have been asked to prepare a report on the scalability of the root zone and the impact of the potential simultaneous introduction of new gTLDs, DNSSEC, IPv6 glue, and IDNs into the root zone, which will be published in August. The GAC will look to this report to provide reassurance that the scaling up of the root will not impair the stability of the Internet and that the technical safeguards are sufficient. The GAC is hopeful the report will stress the importance of developing an alert or warning system, as well as the need for a process for halting the adoption of new top level domains should the root zone begin to show signs of breach or weakness. It should be noted that although the GAC is encouraged this study is underway there is some concern as to why the proper analysis did not occur earlier.

RESPONSE

In February 2009, with Resolution 2009-02-03-04, the ICANN Board requested the Root Server System Advisory Committee (RSSAC), the Security and Stability Advisory Committee (SSAC),
and the ICANN staff, including the IANA team, to study the potential issues regarding the addition of IDNs, IPv6 addresses, DNSSEC and substantial numbers of new TLDs to the root zone. The Terms of Reference for this study are at:

We note the GAC’s concern that the analysis of the scalability of the root zone should have been undertaken earlier, at the time the new gTLD PDP was being undertaken, and confirm that it was the opinion of the technical community that the DNS could scale to accommodate an unlimited number of TLDs, including IDNs. (See: www.icann.org/en/topics/dns-stability-draft-paper-06feb08.pdf.)

The more recent advent of DNSSEC and IPv6 glue and their potential simultaneous impact on the scalability of the DNS, in addition to new TLDs, has resulted in the current study being undertaken to ascertain, if these combined effects will have an adverse effect on the DNS.

Interisle was selected to perform this study. In the course of their study, they recommended that a modeling effort be undertaken with the assistance of TNO. TNO produced a model and a companion report. The Interisle report was posted for public along with a covering note from the joint RSSAC/SSAC/ICANN staff steering group for this study on 18 September 2009, http://www.icann.org/en/announcements/announcement-2-18sep09-en.htm. The TNO model and simulation system is undergoing verification and will be released soon along with the companion report. The Interisle report addresses the interactions between potential changes that would impact the root zone and the inherently adaptable nature of the root system as the fundamental aspect of considering the implications of these changes. The report also does stress the need for an early warning system as a means for understanding emerging risks to enable effective planning in response. The SSAC and RSSAC along with the study steering group will be evaluating the report against the Terms of Reference and preparing recommendations for the Board and the public related to establishment of an early warning system and approaches to addressing concerns raised in the report.

In addition and as part ICANN's ongoing efforts to ensure the stability of the DNS, ICANN staff contracted with the DNS Operations, Analysis and Research Center (https://www.dns-oarc.net/) as independent and well-respected experts to provide an analysis of the impact of adding IPv6, DNSSEC, and additional top-level domains to the ICANN-operated L root server.

This study, while independent of the Root Server System Root Scaling Study and focused specifically on the impact to the ICANN-operated L root server, has been used as input in the more comprehensive study undertaken by the Root Scaling Study Group.

The final report of the DNS-OARC study has now been published at http://www.icann.org/en/topics/ssr/root-zone-augmentation-analysis-17sep09-en.pdf.
Questions 2 and 3 are combined as responses overlap

2. Economic Studies

The GAC had registered its concern at the Mexico City meeting that the two preliminary reports on competition and price caps had not provided appropriate answers to the 2006 Board request for economic studies to be undertaken. Such analysis is needed to take full account of the entire domain name environment. The GAC remains concerned that the threshold question has not been answered whether the introduction of new gTLDs provides potential benefits to consumers that will not be outweighed by the potential harms.

The GAC notes that the economic reports commissioned by ICANN have failed to distinguish adequately between real demand and derived demand arising from widespread concern in the business community about the multiplication of the opportunity for cybersquatting, fraud and malicious conduct generally. The GAC notes that the recent IRT report addresses a number of related intellectual property protection and enforcement issues. However, the GAC believes there is an urgent need for separate empirical research to be undertaken regarding the costs of defensive registrations and the impact on consumers of the availability of new gTLDs. To the extent that the uses of new gTLDs are innovative and respond to registrant demand, the GAC expects there would be benefits to consumers.

The GAC also recommends that any analysis of the gTLD environment encompass fact gathering beyond empirical studies. A thorough analysis would include interviews with and perhaps surveys of a wide cross-section of market participants. As a first step in this process, the GAC recommends that ICANN more systematically conduct outreach and data gathering from the variety of resources represented by the participants in the malicious conduct and e-crimes sessions in Sydney.

3. Competition

The GAC has considered whether there is a risk that the gTLD process could create a multitude of monopolies rather than increasing competition. This rests in part on important, but unanswered questions relating to: (1) whether registrants view gTLDs as reasonable substitutes for one another; and (2) why some registrants purchase the same domain name in multiple TLDs.

Further concerns have arisen regarding the apparent desire to alter existing policy that requires a structural separation between registrars and registries. Change to this policy should be guided primarily by whether and how such a change would benefit consumers and registrants. Studies to date have not fully addressed this aspect of the marketplace, nor have they included an analysis of the potential harm to domain name registrants of permitting registrars to operate as new gTLD registries.
RESPONSES

New gTLD – Economic Study

I. Summary

The calls for economic studies cover several different issues, and even these questions/phrases mean different things to different people. The issues fall into the following three categories:

1) Fulfillment of 2006 Board resolution
2) Economic analysis of benefit vs. cost
3) Public benefit of introducing new gTLDs / demand for new gTLDs

ICANN proposes a plan for dealing with each of these issue areas separately. Once we have agreed on an overall plan internally, ICANN will structure our answers into appropriate categories externally as well, and avoid the inappropriate grouping under the heading "economic studies".

There has been substantial work to answer the economic questions associated with new gTLDs. A set of four related studies was released. Existing economic studies indicate significant consumer benefit flowing from the introduction of new gTLDs and identify risks that should be mitigated prior to introduction. Some of the elements that offer benefits to consumers include: lower cost, more choice, new languages (IDN), and innovation. Staff has taken action to mitigate identified risks through improved new gTLD implementation plans, primarily related to IP concerns and malware concerns.

There has been comment that additional study should be undertaken. That form of comment has cited different objectives. We anticipate that the analytical value of further studies will be small; and, it appears that an objective of the calls for additional study is to delay the implementation. It may well be that no action/outcome (other than delay) will quell that criticism. Still, there may be consensus-building value in heeding the call for additional study, and staff is proposing additional study.

II. Background

Contractual Issues

There has been a considerable amount of research and work undertaken on the impact that the introduction of new gTLDs will have on various stakeholders, including consumers, trademark owners, existing registries and registrars. In addition to the economic studies commissioned by ICANN, much of the work undertaken on the ‘overarching issues’ have addressed the issues of
cybersquatting, malicious conduct and trademark related issues, such as defensive registrations, which are nominated by the GAC as areas of concern.

While acknowledging the GAC’s assertion that the economic studies did not answer the Board’s call in 2006 for economic studies, it must be noted that the Board’s request of 2006, was associated with considering the renewal and amendment of existing gTLD contracts, such as .biz and .info, and not new gTLDs. These issues are:

- Should there be price caps for registration services?
- Are registrations in different TLDs substitutable?
- What are the effects of the switching costs involved in moving from one TLD to another?
- What is the effect of the market structure and pricing on new TLD entrants?

During the comment period of the first Draft Applicant Guidebook a number of issues were raised that focused on the costs associated with the introduction of new gTLDs, and the risks associated with:

- Trademark infringements,
- Protection of trademarks at top-level,
- Costs for defensive second-level registrations,
- Potential growth in malicious conduct, and
- Potential for user confusion

In an attempt to answer questions related to registry contractual issues, market structure questions and possible new costs and risks as identified by the Board and comments received on the first Draft Applicant Guidebook, a series of related studies of the domain name marketplace were undertaken, and subsequently released, namely:

- Preliminary Report of Dennis Carlton Regarding the Impact of New gTLDs on Consumer Welfare (March 2009)
- Preliminary Analysis of Dennis Carlton Regarding Price Caps for New gTLD Internet Registries (March 2009)
- Report Of Dennis Carlton Regarding ICANN’s Proposed Mechanism for Introducing New GTLDs (May 2009)
- Comments on Michael Kende’s Assessment of Preliminary Reports on Competition and Pricing (May 2009)

The studies identified potential costs associated with gTLD expansion, for example:

- Potential for user confusion,
- Imposing significant costs on trademark holders by forcing them to establish “defensive” registrations,
- Increased opportunity for malicious conduct, and
- Taxing the capabilities of the root zone,

and recommended that the gTLD implementation undertake actions in mitigation of those concerns. These actions include:
• Existing objection and dispute resolution procedures for:
  o Similar TLD applications causing user confusion
  o Misuse of community labels
  o Infringement of rights
• Introduction of additional rights protection mechanisms
• Measures to mitigate and reduce malicious conduct
• Root zone scaling study

The study also anticipated benefits with gTLD expansion:
• Removing artificial restrictions on the marketplace
• Increasing output, lowering prices and increasing innovation
• Increased, enhanced participation
• Expanded community representation
• Expanded regional participation through IDNs
• Clearer, easier brand identification: i.e., a brand no longer has to be “brand.com”

Finally, there were conclusions regarding price controls:
• Price caps or ceilings on prices charged by operators of new gTLD registries are not necessary.
• Trademark holders should be protected through alternate rights protection mechanisms.
• New gTLD registries that attempt to act opportunistically by subsequently raising prices face significant risk of harming their reputation and the loss of customers.
• The imposition of price caps for new gTLDs may inhibit the development and marketplace acceptance of new gTLDs.

III. Action Plan

Fulfillment of 2006 Board resolution:
• Consider analysis that has been done with respect to the 2006 Board resolution, to determine if additional action can be fruitfully taken.
• Augment the existing studies to map the findings to the questions posed by the Board.
• Seek positive closure on this issue with the Board and community.

Economic analysis of benefit vs. cost:
• Retain economists to review and summarize work to date, ideally putting that work into the context of the questions some have said remain open.
• With that work done, state that the question is answered from an ICANN viewpoint.

Public benefit of introducing new gTLDs:
• Assuming positive results of a feasibility assessment (understanding expected outcome, cost, and time), staff will initiate a new study on public benefit of new gTLDs.
• The public benefit analysis will be a verification of the policy work. This approach will enable implementation work proceed while this additional study is being done.
• This is intended to be responsive to the community call for a new study.

Registry-Registrar Separation

I. Status quo

ICANN has not had a policy prohibiting gTLD registrars from applying for or operating registries. Historically, ICANN has permitted registry-registrar cross-ownership with structural separation requirements. Recent agreements entered with registry operators since 2005 have included prohibitions on acquiring more than a 15% interest in registrars.

Currently, there is not a prohibition on registries acting as resellers or using registrars as back-end registry service providers. Registrars currently provide back-end services for TLD registries.

Current practices have worked well in the context of a relatively static set of competitors on the registry and registrar side. It is expected that the numbers of registries using back-end registry service providers may grow substantially in the new gTLD environment. This isn’t anticipated in current practices, and requires a reevaluation of structural separation in the new gTLD environment.

II. New gTLD implementation planning

Based on the requirement to reevaluate current structures, and at community request, ICANN commissioned an independent study that recommended a limited lifting of co-ownership restrictions. That and a set of face-to-face community meetings resulted in a model published in the initial Guidebook.

The registry constituency issued a report that opposed integration and sought to prohibit registrars from competing for back-end services. Two registrars published responses. As a result of the registry report, ICANN engaged another set of economists who recommend that, with caveats, all restrictions be removed.

The two economists were selected for their diversity of views – they are on opposite ends of the spectrum in antitrust thinking. It was thought that they would either: develop separate views for discussion; or, arrive at the same view, indicating a conclusion that would have broad “economist” support.

The anticipated changes in the market and the fact that no party is recommending an un-changed status quo requires ICANN to consider new options. There are four options to be considered:
1) No cross-ownership restrictions except where there is market power and/or registry price caps (regulation needs, if any, left to regulating authorities)
2) No cross-ownership restrictions for new registries, existing restrictions for existing registries (probably most disagreeable outcome to registries)
3) Limited lifting with enhanced structural separation:
   a. The registrar cannot sell names in the co-owned registry, or
   b. The registrar can sell a very limited number of names in the co-owned registry
   While this approach may represent a reasonable transition strategy, economists indicate this removes the possible consumer advantages in efficiencies due to structural integration.
4) Complete restrictions:
   a. Registries cannot have ownership percentage in registrars, and vice versa
   b. Registrars prohibited from providing back-end services (this might be accompanied by reciprocal restrictions, i.e., that registries cannot provide back-end services for other registries and registries cannot own resellers).

The final position will take into consideration:
1. Registrar accreditation still required.
2. If an entity is abusing its market position to hinder competition, a relevant government competition authority should make that determination. ICANN has contractual authority, and governmental authority on competition issues is most appropriate.
3. Rules made should be enforceable, not easily circumvented. Rules to prevent “selling shelf space” or against owning resellers can be overcome through other forms of agreement or organization. Imposing co-ownership restrictions on registries with price caps would not necessarily prevent them from inserting themselves higher in the value chain and circumventing the effects of price caps.
4. While some risks are avoided through limited lifting of restrictions, the limitation also obviates most of the benefits.
5. ICANN might consider removing price controls on registries without market power in order to facilitate their entry to moving into the less regulated space.

With the current input:
- The incumbent registries generally advocate imposing new and tighter restrictions on the ability of registry operators to own registrars. Additionally, existing registries want to define back-end registry operation to be the same as a commercial registry operator. This restriction and interpretation would effectively limit registrars' ability to compete against registries' TLD and back-end services offerings. Registries argue that since they have been prevented from owning registrars they would be at a disadvantage if the restrictions
are not tightened since they have not established retail relationships with registrants. One of the risks identified is that registrars can leverage “shelf space” to gain back-end service market share.

- Registries argue that abuses can occur if a single entity holds the registry and customer (registrar) data.
- Economists are still at work, but so far have indicated (in the CRA report and at the Sydney workshop) that there are potential benefits to consumers from allowing cross-ownership, including lower prices and more innovation.
- Economists also indicate that separation does not fully meet registry concerns. Registrars can and will allocate shelf space through means other than agreement to provide back-end services: for cash payments or other forms of consideration. They also indicate that data abuses can be prevented through agreement.

4. Balancing Competing Business Models

*Such is the global reach of the Internet that varied business models will arise amongst different commercial parties, especially where the parties operate in different jurisdictions, in different markets and in varying spheres of economic development.*

While noting that applicants would be allowed to scale their applications, so that an applicant that intends to compete with large top level domains and have millions of registrations would require infrastructure on a greater scale, while a registry that intends to address a small local community would need infrastructure on a lesser scale, the GAC seeks reassurances that the evaluation of the applicant’s business model would be conducted on merit and not rely solely on corporate size and financial criteria.

RESPONSE

The balancing of competing business models is a fundamental principle that ICANN has applied in its implementation of the evaluation process. ICANN has avoided setting highly prescriptive technical or financial requirements precisely to enable consideration of applications representing a variety of applicant types, jurisdictions, and purposes, both commercial and non-commercial.
In accordance with the GNSO’s policy recommendations, the evaluation process does evaluate whether the applicant has the technical, operational, and financial capability to run a TLD registry that will be secure and stable. In addition, successful applicants will have to pass pre-delegation tests to ensure that they have put in place operations that meet certain technical aspects of the evaluation criteria. The evaluation process takes into account such elements as the level of preparation shown by the applicant, level of resiliency in proposed systems, and consistency of technical, operational, and financial elements within the application. The current evaluation criteria contain no advantage for corporate size or financial strength beyond that required to meet the plans specified in the application.

5. Risk of End User Confusion

It will prove likely that the average Internet user will place greater emphasis on retaining the ease of navigation around the existing DNS. The DAG2 does not specifically address the issue of how the new gTLDs will integrate with the existing gTLDs. The GAC believes therefore that there is a need for more studies to be commissioned which assess the impacts of a radically changed new gTLD regime on end users. Such studies should focus in particular on the extent to which the expected proliferation of domains may cause confusion or may exacerbate the harms from the malicious conduct and criminal activity that consumers experience in the current marketplace, or whether a more measured rollout would be more beneficial and cause less consumer confusion. The GAC wishes to emphasize the point that such fact finding studies as these should have been conducted prior to the decision to introduce new gTLDs.

RESPONSE

There are several areas of the Draft Applicant Guidebook that address issues of potential confusion. One GNSO policy recommendation states that new gTLD strings must not be confusingly similar to an existing top-level domain. This recommendation is implemented through the work of the string evaluation panel that will compare each applied for string against every other string, existing and applied for, to determine if a likelihood of user confusion if both strings are delegated in the root zone. Their work will be abetted a string similarity algorithm, developed specifically for the new gTLD evaluation process at considerable expense. The algorithm, while not dispositive, will provide evidence of the degree of similarity.

In addition to this evaluation, parties with ‘standing’ may object to an applied for string as being so similar to an existing, or an applied for string, that user confusion will likely result. The confusion may result from visual, oral or semantic similarity.

Another policy recommendation states that strings must not infringe the existing legal rights of others. ICANN has made a significant investment to develop rights protection mechanisms (including the formation of an advisory panel, the Implementation Recommendation Team) so
that user confusion does not result in the misappropriation of trademarks. These potential mechanisms include the establishment of a Trademark Clearinghouse, rapid takedown procedure, a requirement for thick Whois data maintenance, and a post-delegation dispute mechanism. Consideration of these proposed mechanisms is now ongoing.

In addition to these new rights protection mechanisms, the Guidebook has always provided for an objection process where rights holders can object to applied for strings considered to violate their rights. Any rights holder has standing to object and these procedures and standards are well defined in the Guidebook.

Considerable study has been undertaken (both before and after the publication of the first Guidebook) to determine and mitigate the potential for end user confusion. Input to this study was received from a number of stakeholders on possible costs and risks associated with the introduction of new gTLDs, notably Anti Phishing Working Group (APWG), Registry Internet Safety Group (RISG), the Security and Stability Advisory Committee (SSAC), Computer Emergency Response Teams (CERTs) and members of the banking, financial, and Internet security communities. Studies by the APWG and RISG were published. ICANN also consulted with firms that advise national trademark offices to best understand how to address confusion issues.

Certain trademark owner input comment indicates that new TLDs will enable brand owners to establish user awareness about their TLD labels and that new TLDs will increase the use of search engines, rather than typing trial addresses in address bars thereby reducing the number of typos and resulting in fewer successful cybersquatting instances and phishing attacks.

It is acknowledged that some significant level of user confusion with domain names clearly exists at present, for example, the use of lookalike and similar domains are currently a significant factor in both phishing and fraud. ICANN views the introduction of new gTLDs as an opportunity to reduce this confusion by allowing e-commerce entities, as well as others, to operate their sites from a unique domain space which matches its brand and which is under their control. If, for example, authentic paypal sites ended only in .paypal - potentially the current risk of fraud or phishing using labels such as pay.pal.com or paypal1.com or paypal.com.us would be reduced.

Steps taken to mitigate malicious conduct will continue. ICANN will explore the formation of a working group combining members within the security industry and ICANN community to help develop and assess solutions and specific implementations of proposed mitigation measures.

6. Administrative Resources
Consideration should also be given to the increase in the required administrative resources available to ICANN for the management of the DNS arising from the expected significant increase in domains, and whether other activities, such as contract compliance, will be impacted by the possible diversion of resources to processing new gTLD applications.

The GAC also notes that potential new registries will come from many countries in the world with different languages and cultures. ICANN will need to address the need for it to adjust as an organization to a more diverse Internet community with the likely appearance of contractors outside the United States working within different legal environments and legal systems.

RESPONSE

ICANN is currently identifying operational impacts on the organization from the introduction of new TLDs. ICANN departments and internal processes that may be impacted by the introduction of new TLDs will be reviewed and prioritized, to ensure that sufficient resources are available. A separate department will be established to oversee the processing/evaluation of applications, assisted by a number of evaluation panels. ICANN does not foresee any diversion of resources from existing functions due to the processing of new gTLD applications.

ICANN has recently added contractual compliance and legal staffing resources in the Asia / Pacific region, and intends to hire additional compliance staff prior to the delegation of new TLDs in the root. This is a small part of the scaling of ICANN staffing to be operationally ready to address the requirements for providing services for new TLDs. An operational readiness plan is being prepared to provide IANA, registry liaison, contractual compliance, finance and other services.

ICANN anticipates new registries will be added that are representative of the global Internet community. These registries will come from many countries worldwide, supporting a wide range of languages, cultures and scripts. ICANN is already adjusting by employing a diverse international staff in offices located in its offices located in Australia, Belgium and the United States, as well as in regional locations such as Egypt, Niger, Poland, France, the Netherlands, Switzerland, the Caribbean and Italy.

II. IMPLEMENTATION ISSUES

1. Level of Awareness among Stakeholders and the Business Community

ICANN should address the very low level of awareness of the proposed gTLD round amongst the business community, in particular amongst small and medium sized businesses, outside the Internet industry and the existing registry and registrar communities. The GAC recommends that
ICANN more actively promote the opportunity for business in the period prior to the launch of the first and subsequent gTLD rounds.

RESPONSE

As you are aware, ICANN has recently undertaken a number of outreach activities in New York, London, Hong Kong and Abu Dhabi. While the primary focus of these events was to discuss the work of the rights protection mechanisms, it was also an opportunity to inform a broader audience about ICANN and the introduction of new gTLDs. Further events are being planned for Latin America for later in the year. ICANN’s Global Partnerships team has provided information at various events they have attended in their respective regions.

A comprehensive communications strategy has been developed that will be published as part of the implementation plan for new gTLDs, and ICANN would welcome assistance from GAC members in identifying avenues and options for outreach in their respective countries. A significant amount has been expended on this effort to date and the go-forward budget, leading to the delegation of new gTLDs is approximately $2.7 million dollars.

2. gTLD Categories

The GAC proposes that ICANN should actively consider a more category-based approach to the introduction of new gTLDs. This could allow for different procedures for different types of TLDs, including non-commercial cultural, linguistic and regional gTLDs which would strengthen cultural diversity on the Internet, creation of local content, and freedom of expression. It would also potentially lessen consumer confusion and provide a structure for a more measured rollout of new gTLDs.

Furthermore the GAC believes that the structure of the gTLD application fee regime should reflect these different categories and the limited financial resources available to applicants for some of them. The GAC also feels that it would be logical and reasonable to apply existing policy principles and processes for ccTLDs (such as those policy provisions outlined in the GAC’s ccTLD principles) to any top level domains intended to service a specific community within a specific national jurisdiction.

RESPONSE

Significant consideration has been given to the issue of the introducing category-based TLDs in the new gTLD process. The policy recommendations of the GNSO and the GAC principles have resulted in the creation of three gTLD categories or types:

- Community-based TLDs
- Geographic Name TLDs
• Everything else (called Open TLDs)

Similarly to the GAC, community comment suggests the creation of several TLD categories: for example, single-owner, country, intergovernmental organization, socio-cultural, community and open. Depending on the category, various accommodations are suggested; for example, no requirements for an ICANN contract, or to use accredited registrars, or to follow consensus policy, or policy provisions outlined in the GAC’s ccTLD principles. Some might be restricted to not-for-profit status, be eligible for reduced fees, require registration restrictions, and have names reserved in anticipation of registration by certain parties.

The following table indicates some of the categories of TLDs and the accommodations proposed in some of the public comments:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>Contract</th>
<th>Use of Registrars</th>
<th>Consensus Policy</th>
<th>May Be For-Profit</th>
<th>Fees</th>
<th>Restrictions</th>
<th>Name Blocked</th>

</tr>
</tbody>
</table>
The introduction of a number of new gTLD categories with a number of different accommodations will lead to a complex and difficult application, administration and evaluation process, in addition to a very complicated contractual compliance environment. Additionally, there will be considerable debate and discussion in the community as to whether certain accommodations should be made. Should certain gTLDs not be required to have an agreement with ICANN or not be required to follow consensus policy? Should certain TLDs be required to maintain not-for-process status? These discussions and debates will take considerable time and resources and may ultimately not result in consensus.

Parsing fees among TLD categories is problematic at this time due to the uncertain number of applications and thus the current lack of clarity about the extent to which economies of scale can be realized in supporting new gTLDs operationally. It will be difficult to create different fee structures (application or annual fees) in this uncertain environment. Reductions in some application fees will result in increases to others. This is also true in the area of annual registry fees. The annual fee reduction made between the first and second version of the Draft Applicant Guidebook lowered fees to the extent possible given the unknown number of TLDs that will be delegated into the root zone. ICANN has always stated that the idea of fee categories and lower fees will be investigated after the first round and following removal of many of the contingencies and uncertainties.

Finally, the structure of TLD categories, if granted different accommodations with differing contractual obligations, would result in significantly higher compliance costs and therefore, annual fees. If a self-declaration program is instituted and contractual accommodations are eliminated or minimized, fees can remain constant.

It may well be that as definitive categories of applicants emerge in practice, and as ICANN and the respective communities gain further experience of possible benefits of additional gTLD categorization over time, organizational structures might be developed with ICANN to reflect these categories. That will be a consequence of bottom-up policy developments by affected participants, according to the ICANN model. Nothing in the current implementation procedures foreclose those future developments.

3. Geographic Names at the Top Level

The GAC has commented on the use of geographic names as gTLDs on various occasions. The GAC principles of 28 March 2007 emphasize that “ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities” (Article 2.2). In a letter dated 24 April 2009, the ICANN Board received input from the GAC regarding the issue of geographic names as new gTLDs. In this letter the GAC pointed out that the rights of relevant governments or
public authorities, as representatives of the sovereign state or territory, cannot be limited as such by ICANN or by any procedures introduced by ICANN for new gTLDs.

The GAC is of the opinion that the DAG2 is a substantial improvement on its predecessor, but that it does not yet fully reflect the GAC position that governments and other public authorities, as representatives of citizens of a sovereign state, territory, province or city, have a legitimate interest in the use of geographical names as new TLDs.

The GAC therefore proposes the following amendments to be incorporated in version 3 of the Draft Applicant Guidebook (further in the text - DAG3):

i. Strings that are a meaningful representation or abbreviation of a country name or territory name should not be allowed in the gTLD space

These strings represent countries or territories and the principle of sovereignty must apply. TLDs in this category should therefore be treated in the same way as ccTLDs.

The use of exhaustive listings (e.g. ISO 3166-1) will not cover all the ccTLD-like applications envisaged by the GAC and ccNSO, in particular in the following categories:
‘Commonly referred to as’ type strings representing a country or territory but which are not official titles, e.g. .america, .ceylon, .holland;
Common or general names that are often applied to more than one country, e.g: .guinea

RESPONSE

While understanding the sentiment that a country name TLD should be treated as a ccTLD, ICANN policy constrains the way in which it is possible to provide country name TLDs to all countries and territories is under the new gTLD program at this time.¹ The treatment of country and territory names, in version 2 of the Draft Applicant Guidebook, was developed in the context of the points raised by the GAC, the ccNSO, and the GNSO policy recommendations and trying to find a balance among the somewhat contrary views. Applications for country and territory names will require evidence of support or non-objection from the relevant government or public authority which is consistent with GAC principle 2.2.², and that evidence must clearly indicate that the government or public authority understands the purpose of the TLD string and the process and obligations under which it is sought.

¹ Meaningful representations of country or territory names in non-Latin scripts will be available under the IDN Fast Track process but country and territory names in Latin scripts are available in the gTLD program only, until the ccTLD policy development is complete.
² ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities
Safeguards have been developed to ensure that the relevant government or public authority’s sovereign rights are respected, and that the process is understood. It is ultimately the government or public authority’s discretion whether to support, or not support, an application for a country name TLD, and the circumstances under which they would be willing to do so.

The Board raised concerns that the criteria for country and territory names, as it appeared in version 2 of the Draft Applicant Guidebook was ambiguous and could cause uncertainty for applicants. Subsequently, on 6 March 2009, the ICANN Board directed staff to, among other things, “… revise the relevant portions of the draft Applicant Guidebook to provide greater specificity on the scope of protection at the top level for the names of countries and territories listed in the ISO 3166-1 standard”.

The revised definition, provided in a Geographical Names excerpt of the guidebook posted on 30 May 2009, continues to be based on the ISO 3166-1 standard and fulfills the Board’s requirement of providing greater clarity about what is considered a country or territory name in the context of new gTLDs. It also removes the ambiguity that resulted from the previous criteria that the term ‘meaningful representation’ created.

The Board’s intent is, to the extent possible, to provide a bright line rule for applicants. While the revised criteria may have resulted in some changes to what names are afforded protection, it has not changed the original intent to protect all names listed on the ISO 3166-1 list, including the short or long form of the name. It is felt that the sovereign rights of governments continue to be adequately protected as the definition is based on a list developed and maintained by an international organisation.

In the context of the revised definition, the name America is afforded protection, while the names Ceylon and Holland are not. However, the objection process does provide a secondary avenue of recourse. An application will be rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted. With regard to the names .Guinea and .Guinea-Bissau; only the relevant government or public authority for the respective countries can agree to support, or not-object, to the use of their respective names.

ii. gTLDs using strings with geographic names other than country names or territories (so called geoTLDs) should follow specific rules of procedure

The Draft Applicant Guidebook already provides for specific rules of procedure, such as the creation of a Geographic Names Panel or the requirement that an applicant for a geoTLD must document the government’s or public authority’s support for, or non-object to, the applicant’s application, and must demonstrate the government’s or public authority’s understanding of the string being requested and its intended use.
However, the gTLD regime as proposed in DAG2 implies that the active involvement of public authorities would be limited to the application and evaluation phase of the new gTLD process. However, the GAC is of the view that the principles of subsidiarity should also apply after delegation. An approval or non-objection from the relevant government or public authority could for example be based on certain obligations on a gTLD registry for which the registry is held accountable (which may include direct legally binding agreement under contract with the relevant public authority). In such cases there could be a need for procedures that allow the relevant governments or public authorities to initiate a re-delegation process, perhaps because of infringement of competition legislation, misuse or breach of contract, or breach of the terms of approval/non-objection.

Furthermore, in cases of a change in the ownership structure of a geoTLD, ICANN should establish a new process of approval or non-objection for that geoTLD by the relevant public authority. The GAC will provide input in this regard in the near future.

RESPONSE

There is nothing to prevent a Government or public authority conditioning the granting of their approval of TLD requests to the TLD operator and so can influence policy making in a manner appropriate and acceptable to the government or public authority for that TLD. In addition, if the geographic name gTLD designates itself as a community TLD it will have restrictions in its agreement consistent with the restrictions associated with its community-based designation. If the TLD strays from those obligations to represent the community (through registration restrictions, for example), the government can lodge an objection and the decision maker can order the registry to comply with the restrictions in the agreement or face sanctions). To ensure this path is available, the government could condition its approval of the TLD application upon the TLD identifying itself as community TLD so that the government could lodge an objection if the registry operator does not live up to its obligations.

The ICANN gTLD Registry Continuity Plan was developed to transition a TLD to a successor operator in the event that a registry or sponsor is unable to execute critical registry functions, and continue the operation of a TLD in the longer term. This plan will be amended in light of the new gTLD process and, in the case of geographical names as defined in the limited manner by this process, will require the approval of the relevant government or public authority.

4. Objection Procedures and Costs

The GAC considers that the dispute resolution process appears to have the potential to be extremely complex and protracted. The GAC also believes that the cost of pursuing disputes may well prove to be a barrier to legitimate objections by interested parties.
The GAC notes the importance of sensitivities with regard to terms with national, cultural, geographic, and religious significance. The GAC has serious concerns about the practical modalities for addressing objections on these grounds, including ICANN’s proposal to establish a panel of three judicial experts which may not fully take account of cultural and other national and differences in legal interpretation as to what is morally offensive or threatening to public order.

Specifically the GAC believes that there is a need for more work to be done regarding the costs and the ability to object, noting that public interest groups may wish to object but may be unable to do so due to the costs involved. The GAC will deliberate further on alternative solutions with respect to how best to deal with applications for new gTLDs that may be considered morally offensive or threatening to public order.

DAG2 appears to require governments to follow the same procedures and pay the same costs as other objectors. In situations where a government or public authority objects to a particular application on the grounds of public policy however, it would be inappropriate for ICANN to require the said public body to incur the costs or subject itself to the limitations associated with a formal objection process primarily designed for non-governmental stakeholders. Moreover, where the government or public authority is a member of the GAC, the ICANN By-laws already provide a more appropriate mechanism for the GAC to provide advice directly to the Board on issues of public policy.

The GAC notes that the public comment section associated with each application may well provide one avenue for governments wishing to make representations should they chose to use it. The proposed Independent Objector might also consider representations from governments at no cost to them. The GAC would therefore invite the ICANN Board to include these existing and potentially new provisions in the procedures foreseen for the DAG3.

The GAC would also point out that in many cases governments might already have to bear the costs associated with industry stakeholder and cross-government consultation, and increase their monitoring of the application process more generally just to make sure they are aware of issues raised by applications for new gTLDs.

RESPONSE

With regard to the issues raised regarding procedure and cost, the New gTLD Dispute Resolution Procedure (the “Procedure”) was designed to be a well, defined, smooth procedure. The procedures can be found at http://www.icann.org/en/topics/new-gtlds/draft-dispute-resolution-procedure-18feb09-en.pdf and are summarized in Module 3 of the Guidebook. The Procedure includes provisions that are specifically aimed at reducing complexity and avoiding protracted proceedings, such as:

- Electronic filings (Article 6(a));
Limits upon the length of written submissions (Articles 8(b) & 11(e));
Short time limits for submissions and other steps in the procedure (Articles 7(a), 7(e), 9(a), 10(a), 11(b), 13(a), 17(b), & 21(a));
Consolidation of objections (Article 12);
Strict limits upon document production (Article 18); and
Strict limits upon hearings (Article 19).

ICANN would welcome specific suggestions for improving the Procedure. However, the benefits that may be derived from further reducing the complexity and duration of the proceedings must be balanced against the panel’s duty to ensure that the parties are treated with equality and that each party is given a reasonable opportunity to present its position (Procedure, Article 4(e)).

It is foreseen that morality and public order objections will be heard and decided by panels of experts who are eminent jurists of international reputation. The panels will comprise three experts, in order to ensure that diverse backgrounds and perspectives are present in the Panel. See Procedure, Article 13(b)(iii). Such proceedings will necessarily involve a certain level of costs, for example, to cover the time and costs associated with engaging the eminent jurists who serve on the panel.

It is difficult to predict with accuracy whether the costs of the objection procedure will prove to be a barrier to legitimate objections; however, it is felt that the existence of a fee to lodge an objection is necessary as a deterrent to frivolous objections. Interested parties may pool their resources to finance an objection that they consider to be legitimate and important. The rule that the prevailing party will be fully reimbursed for the filing fee and advance payment of costs that it paid (Article 14(e)) is intended to lessen the financial burden upon parties that file a well-founded objection. Finally, it should be recalled that the Independent Objector may also file an objection where, for various reasons (including cost), no other objection had been filed.

Considerable legal research was undertaken which examined the rules of public policy, as they apply to freedom of speech and encompassed the treatment of names of that may have national, cultural, geographic and religious sensitivities in a representative sample of countries, which included Brazil, Egypt, France, Hong Kong, Malaysia, South Africa, Switzerland and the United States of America. The possibility of objecting to an applied-for gTLD on the grounds of morality and public order is derived from the GNSO’s Recommendation No. 6, which states, in part, that “Strings must not be contrary to generally accepted legal norms relating to morality and public order that are recognized under international principles of law.” Various competing interests are potentially involved, for example the rights of freedom of expression versus sensitivities associated with terms of national, cultural, geographic and religious significance. While freedom of expression in gTLDs is not absolute, those claiming to be offended on national, cultural, geographic or religious grounds do not have an automatic veto over gTLDs. The standards summarized by Recommendation No. 6 indicate that a morality and public order
objection should be based upon norms that are widely accepted in the international community. It is felt that a rule that did not require wide acceptance would facilitate pressure to align the standards with those imposed by the most repressive regimes. In addition to the Draft Applicant Guidebook (Module 3), ICANN has published explanatory memoranda, dated 29 October 2008 http://www.icann.org/en/announcements/announcement-29oct08-en.htm and 30 May 2009 http://www.icann.org/en/topics/new-gtlds/morality-public-order-30may09-en.pdf , that set out the specific standards that have been adopted for such objections and the legal research upon which those standards is based.

ICANN considers that a rule-based dispute resolution procedure, leading to a reasoned expert determination (that will normally be published) by three jurists of international renown, is an appropriate method of addressing and resolving disputes arising from objections based upon morality or public order. Indeed, no viable alternative has been suggested.

The Draft Applicant Guidebook does require governments to follow the same procedures and to pay the same costs as other objectors; however, it must be emphasised that the process has been developed to provide more than one avenue for governments, or anyone else, to raise concerns about an application. It has become quite common for governments and other public entities to participate in international dispute resolution proceedings with private parties (e.g., arbitration and other alternative dispute resolution procedures). For example, international arbitration is generally stipulated for the resolution of disputes between States and private investors under bilateral investment treaties (BITs). Such arbitrations may be conducted under rules such as those of the International Centre for the Settlement of Investment Disputes (ICSID), the United Nations Commission on International Trade Law (UNCITRAL) or the International Chamber of Commerce (ICC). Recent years have seen a great increase in the conclusion of BITs. The United Nations Conference on Trade and Development (UNCTAD) has reported that the number of BITs increased dramatically in the 1990s, from 385 in 1989 to a total of 2,265 in 2003, involving 176 countries.3 The total reached 2,676 by the end of 2008.4

Governments that are members of the GAC have a mechanism to provide advice to ICANN’s Board, in accordance with ICANN’s Bylaws; however, it is not clear that Bylaw was intended to provide an avenue for governments to provide advice on operational matters of this nature. The ICANN Board wishes to have a neutral, expert determination, based upon certain published standards, when deciding whether to accept an application for a new gTLD or if an objection should be upheld.

Finally, it should be recalled again in this context that the Independent Objector may file an objection against an applied-for gTLD in cases where governments (and others) choose not to do so. The Independent Objector will be entitled to take into account comments made by any person or entity (including, of course, governments) when deciding whether to file an objection.

5. Application Process

The GAC understands that ICANN intends to hold annual application rounds and those would be announced at the same time as the current round. However, the GAC is of the view that there is a need for clarity on how often the application process for gTLDs will be run, for how long it will remain open and whether there will be a limit on the number of gTLDs released in each round. There is also a question as to whether translation services will be provided as internationalized gTLDs are introduced. The GAC understands that ICANN will set up a separate organization overseen by a director to process applications.

The GAC seeks clarification on how CANN will promote the new gTLD round so that affected parties are aware of their rights to object.

RESPONSE

As described in the Draft Applicant Guidebook, ICANN’s goal is for subsequent application rounds to begin within one year of the close of the application submission period for the initial round. ICANN anticipates being able to announce future rounds soon after launching the program. ICANN anticipates potential changes to the process based on experiences gained, and is not prepared to announce exact timing at this stage. Regarding how long application processes will remain open, it is anticipated that an application submission period will be approximately 60-90 days. There is not currently expected to be a limit on the number of gTLDs approved in each application round.

Regarding translation services, draft Applicant Guidebook materials have been published in six languages, and ICANN expects to continue making program materials available in multiple languages. While the applications are required to be submitted in English, ICANN has allowed for supporting documents (for example, proof of legal establishment, financial statements) to be submitted in the original language, with any resulting translation needs being covered by ICANN. In addition, ICANN will continue its organization-wide initiative for translation and interpretation to support global engagement. It is certainly expected that the new gTLD program communications will be a key part of this effort.

ICANN has established a separate function within the organization to handle the processing of applications. It is not a separate organization.
6. Application Fee and Surpluses

A single fee structure creates limitations, notably by skewing the market in favor of applications from the developed world and those with significant financial resources. The GAC notes that ICANN had stated in its briefings that it was difficult to forecast costs accurately enough to offer different tiers of pricing, including discounts for community-based TLDs. However, the GAC believes that experience gained in the initial round would inform decisions on fee levels, and the scope for discounts and subsidies in subsequent application rounds.

The GAC is of the view that clarification is urgently needed to explain the level of the fee for a single application and the costs on which it was based, including historic and legal liability costs. The GAC notes that where governments are involved, as, for example, sponsors of community-based applications, legal liability costs might be less.

The GAC understands that ICANN will set up a separate organization to process applications which would not be heavily staffed and thus not expensive to run. If this is the case, it should allow ICANN to lower the costs or to provide for a more tiered pricing system.

The GAC expects that the gTLD round may well generate substantial surpluses and is of the view that ICANN should make clear how it would use such surpluses. As noted in previous GAC comments, community consensus should be sought on appropriate uses for any surplus revenues.

RESPONSE

As the GAC suggests and as ICANN has stated several times, the experience gained from the initial round of applications will inform decisions on fee levels, and the scope for discounts and subsidies in subsequent rounds. ICANN has always stated that the idea of fee categories and lower fees will be investigated after the first round and following removal of many of the contingencies and uncertainties.

The fees are revenue neutral.

With regard to the GAC view that clarification is urgently needed to explain the level of the fee for a single application and the costs on which it is based, a detailed explanation of the application fee derivation is provided in the Cost Considerations of the new gTLD Program paper [http://www.icann.org/en/topics/new-gtlds/cost-considerations-23oct08-en.pdf](http://www.icann.org/en/topics/new-gtlds/cost-considerations-23oct08-en.pdf) that was posted on 23 October 2008. The fee of $185,000 is based on a detailed cost estimation process which contains three elements: costs for developing the new gTLD process (based on historical costs of previous rounds), readily identifiable costs of evaluating and processing an application, and the more uncertain/difficult to estimate elements of the application and delegation process.
The evaluation fee was based on detailed analyses of specific tasks and steps needed to perform the evaluation. ICANN has taken a detailed and thorough approach to estimating program development costs, process and risk costs associated with this new program, and consistently used a set of principles in applying the estimation methodology. The results have been tested with sensitivity and other analysis, and appropriate expertise has been retained and applied.

The costs of the program have recently been re-evaluated and the results of the re-evaluation and the supporting data will be posted with the next version of the Applicant Guidebook.

Although the evaluation fee of $185,000 may be burdensome for certain organizations that are considering applying for a new gTLD, the evaluation fee was developed based upon a policy of revenue-cost neutrality, conservatism, and a detailed cost estimating exercise. The impact on a specific applicant or a class of applicant, by policy, is not a factor in the development of the evaluation fee. While it is acknowledged that some applications may have lower processing costs than others, and the costs associated with evaluating applications may vary, it is difficult, if not impossible, to determine which applications will require more or less resources. The application fee is based upon the estimated average cost of all applications based upon principles of fairness and conservatism.

In the event that there is a surplus from the new gTLD application round, the excess funds will not be used for ICANN’s general operations. They will be disposed of in a manner consistent with the community’s feedback and the policy recommendations. ICANN’s multi-stakeholder model for decision making will be employed to ensure that all decisions regarding the underlying guiding principles, amounts, recipients, timing and manner of disposition of surplus funds, if any, will be handled in accordance with the communities’ wishes.

To conclude, I hope you found this information useful and clear. Please contact my office with follow-up that the GAC might have and I will ensure that those questions are addressed. We look forward to comments of the GAC to the Guidebook excerpts and associated material published at http://www.icann.org/en/announcements/announcement-2-31may09-en.htm and to the third version of the Guidebook that will be published prior to the Seoul meeting.

Sincerely,

Peter Dengate Thrush
Chairman of the Board
AFFIRMATION OF COMMITMENTS BY THE UNITED STATES
DEPARTMENT OF COMMERCE AND THE INTERNET CORPORATION FOR
ASSIGNED NAMES AND NUMBERS

1. This document constitutes an Affirmation of Commitments (Affirmation) by the
United States Department of Commerce ("DOC") and the Internet Corporation for
Assigned Names and Numbers ("ICANN"), a not-for-profit corporation. In recognition
of the conclusion of the Joint Project Agreement and to institutionalize and memorialize
the technical coordination of the Internet's domain name and addressing system (DNS),
globally by a private sector led organization, the parties agree as follows:

2. The Internet is a transformative technology that will continue to empower people
around the globe, spur innovation, facilitate trade and commerce, and enable the free and
unfettered flow of information. One of the elements of the Internet’s success is a highly
decentralized network that enables and encourages decision-making at a local level.
Notwithstanding this decentralization, global technical coordination of the Internet’s
underlying infrastructure - the DNS - is required to ensure interoperability.

3. This document affirms key commitments by DOC and ICANN, including
commitments to: (a) ensure that decisions made related to the global technical
coordination of the DNS are made in the public interest and are accountable and
transparent; (b) preserve the security, stability and resiliency of the DNS; (c) promote
competition, consumer trust, and consumer choice in the DNS marketplace; and (d)
facilitate international participation in DNS technical coordination.

4. DOC affirms its commitment to a multi-stakeholder, private sector led, bottom-up
policy development model for DNS technical coordination that acts for the benefit of
global Internet users. A private coordinating process, the outcomes of which reflect the
public interest, is best able to flexibly meet the changing needs of the Internet and of
Internet users. ICANN and DOC recognize that there is a group of participants that
engage in ICANN’s processes to a greater extent than Internet users generally. To ensure
that its decisions are in the public interest, and not just the interests of a particular set
of stakeholders, ICANN commits to perform and publish analyses of the positive and
negative effects of its decisions on the public, including any financial impact on the
public, and the positive or negative impact (if any) on the systemic security, stability and
resiliency of the DNS.

5. DOC recognizes the importance of global Internet users being able to use the Internet
in their local languages and character sets, and endorses the rapid introduction of
internationalized country code top level domain names (ccTLDs), provided related
security, stability and resiliency issues are first addressed. Nothing in this document is an
expression of support by DOC of any specific plan or proposal for the implementation of

---

1 For the purposes of this Affirmation the Internet’s domain name and addressing system (DNS) is defined as: domain names; Internet protocol addresses and autonomous system numbers; protocol port and parameter numbers. ICANN coordinates these identifiers at the overall level, consistent with its mission.
new generic top level domain names (gTLDs) or is an expression by DOC of a view that the potential consumer benefits of new gTLDs outweigh the potential costs.

6. DOC also affirms the United States Government’s commitment to ongoing participation in ICANN’s Governmental Advisory Committee (GAC). DOC recognizes the important role of the GAC with respect to ICANN decision-making and execution of tasks and of the effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the Internet DNS.

7. ICANN commits to adhere to transparent and accountable budgeting processes, fact-based policy development, cross-community deliberations, and responsive consultation procedures that provide detailed explanations of the basis for decisions, including how comments have influenced the development of policy consideration, and to publish each year an annual report that sets out ICANN’s progress against ICANN’s bylaws, responsibilities, and strategic and operating plans. In addition, ICANN commits to provide a thorough and reasoned explanation of decisions taken, the rationale thereof and the sources of data and information on which ICANN relied.

8. ICANN affirms its commitments to: (a) maintain the capacity and ability to coordinate the Internet DNS at the overall level and to work for the maintenance of a single, interoperable Internet; (b) remain a not for profit corporation, headquartered in the United States of America with offices around the world to meet the needs of a global community; and (c) to operate as a multi-stakeholder, private sector led organization with input from the public, for whose benefit ICANN shall in all events act. ICANN is a private organization and nothing in this Affirmation should be construed as control by any one entity.

9. Recognizing that ICANN will evolve and adapt to fulfill its limited, but important technical mission of coordinating the DNS, ICANN further commits to take the following specific actions together with ongoing commitment reviews specified below:

9.1 Ensuring accountability, transparency and the interests of global Internet users: ICANN commits to maintain and improve robust mechanisms for public input, accountability, and transparency so as to ensure that the outcomes of its decision-making will reflect the public interest and be accountable to all stakeholders by: (a) continually assessing and improving ICANN Board of Directors (Board) governance which shall include an ongoing evaluation of Board performance, the Board selection process, the extent to which Board composition meets ICANN’s present and future needs, and the consideration of an appeal mechanism for Board decisions; (b) assessing the role and effectiveness of the GAC and its interaction with the Board and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS; (c) continually assessing and improving the processes by which ICANN receives public input (including adequate explanation of decisions taken and the rationale thereof); (d) continually assessing the extent to which ICANN’s decisions are embraced, supported and accepted by the public and the Internet community; and
(e) assessing the policy development process to facilitate enhanced cross community deliberations, and effective and timely policy development. ICANN will organize a review of its execution of the above commitments no less frequently than every three years, with the first such review concluding no later than December 31, 2010. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the Chair of the Board of ICANN, the Assistant Secretary for Communications and Information of the DOC, representatives of the relevant ICANN Advisory Committees and Supporting Organizations and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the Chair of the Board of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations. Each of the foregoing reviews shall consider the extent to which the assessments and actions undertaken by ICANN have been successful in ensuring that ICANN is acting transparently, is accountable for its decision-making, and acts in the public interest. Integral to the foregoing reviews will be assessments of the extent to which the Board and staff have implemented the recommendations arising out of the other commitment reviews enumerated below.

9.2 Preserving security, stability and resiliency: ICANN has developed a plan to enhance the operational stability, reliability, resiliency, security, and global interoperability of the DNS, which will be regularly updated by ICANN to reflect emerging threats to the DNS. ICANN will organize a review of its execution of the above commitments no less frequently than every three years. The first such review shall commence one year from the effective date of this Affirmation. Particular attention will be paid to: (a) security, stability and resiliency matters, both physical and network, relating to the secure and stable coordination of the Internet DNS; (b) ensuring appropriate contingency planning; and (c) maintaining clear processes. Each of the reviews conducted under this section will assess the extent to which ICANN has successfully implemented the security plan, the effectiveness of the plan to deal with actual and potential challenges and threats, and the extent to which the security plan is sufficiently robust to meet future challenges and threats to the security, stability and resiliency of the Internet DNS, consistent with ICANN’s limited technical mission. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.
9.3 Promoting competition, consumer trust, and consumer choice: ICANN will ensure that as it contemplates expanding the top-level domain space, the various issues that are involved (including competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection) will be adequately addressed prior to implementation. If and when new gTLDs (whether in ASCII or other language character sets) have been in operation for one year, ICANN will organize a review that will examine the extent to which the introduction or expansion of gTLDs has promoted competition, consumer trust and consumer choice, as well as effectiveness of (a) the application and evaluation process, and (b) safeguards put in place to mitigate issues involved in the introduction or expansion. ICANN will organize a further review of its execution of the above commitments two years after the first review, and then no less frequently than every four years. The reviews will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

9.3.1 ICANN additionally commits to enforcing its existing policy relating to WHOIS, subject to applicable laws. Such existing policy requires that ICANN implement measures to maintain timely, unrestricted and public access to accurate and complete WHOIS information, including registrant, technical, billing, and administrative contact information. One year from the effective date of this document and then no less frequently than every three years thereafter, ICANN will organize a review of WHOIS policy and its implementation to assess the extent to which WHOIS policy is effective and its implementation meets the legitimate needs of law enforcement and promotes consumer trust. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, as well as experts, and representatives of the global law enforcement community, and global privacy experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

10. To facilitate transparency and openness in ICANN’s deliberations and operations, the terms and output of each of the reviews will be published for public comment. Each review team will consider such public comment and amend the review as it deems appropriate before it issues its final report to the Board.
11. The DOC enters into this Affirmation of Commitments pursuant to its authority under 15 U.S.C. 1512 and 47 U.S.C. 902. ICANN commits to this Affirmation according to its Articles of Incorporation and its Bylaws. This agreement will become effective October 1, 2009. The agreement is intended to be long-standing, but may be amended at any time by mutual consent of the parties. Any party may terminate this Affirmation of Commitments by providing 120 days written notice to the other party. This Affirmation contemplates no transfer of funds between the parties. In the event this Affirmation of Commitments is terminated, each party shall be solely responsible for the payment of any expenses it has incurred. All obligations of the DOC under this Affirmation of Commitments are subject to the availability of funds.

FOR THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION:

Name: Lawrence E. Strickling
Title: Assistant Secretary for Communications and Information
Date: September 30, 2009

FOR THE INTERNET CORPORATION FOR ASSIGNED NAMES AND NUMBERS:

Name: Rod Beckstrom
Title: President and CEO
Date: September 30, 2009
EXECUTIVE SUMMARY
As the launch of the process for delegating new gTLDs nears, ICANN continues to solicit and consider public comment in order to hone the implementation plan. Most recently, amendments were published to several sections of the Applicant Guidebook – the instruction manual for gTLD applicants. These amendments were published for comment.

This document summarises these comments and is intended to provide an indication of the analysis and balancing that occurred when determining how the suggestions could best be incorporated into the Guidebook. Each comment was carefully read, considered and analyzed for how the ideas expressed might appear in the evaluation process.

There were fewer comments in this iteration of the Guidebook for two reasons. One, comments were focused on specific excerpts of the Guidebook, and two, there were fewer changes this time as some issues are settling and some issues were addressed in different comment fora (e.g., the trademark issues) had a separate comment section. Nonetheless, most comments are well-thought through and merit full attention.

Sources
Public Comments Postings (31 May to 20 July 2009). Links to the full text of these postings (for Modules 2-5) may be found at http://www.icann.org/en/topics/new-gtlds/comments-e-en.htm.
GENERAL CONCERNS/OTHER

I. Key Points

- ICANN’s launch of new gTLDs targets the narrowly tailored ICANN mission to: ensure DNS stability and security; encourage competition and choice for consumers; expand regional participation in the DNS; and facilitate the multi-stakeholder policy development model.

- The new gTLD implementation strives to meet each of the GNSO policy recommendations, recognizing that each is targeted at meeting the elements of ICANN’s mission statement described above.

II. Comment Summary

New gTLD Program: process, GNSO and staff role

The “Analysis and Proposed Position” sections of the May 31-posted Analysis of new gTLD Public Comments do not adequately address the real concerns raised in the comments. ICANN points back to the “GNSO Council” vote that happened ages ago, as though it still has any validity. Real consensus can only be formed if it was the GNSO itself that would create future guidebooks via a PDP process workgroup-style system, one open to all stakeholders. The staff-created and staff-centric approach is not working; it is elevating the role of staff compared to the level of the public and is top-down instead of bottom up. G. Kirikos (31 May 2009).

Business owners—cost, timing, and business development concerns

How accessible will the gTLD process be for business owners and potential business owners? Is there any actual dollar amount that has been considered for the cost of a gTLD? When is the tentative date that this process will be operational? How is ICANN going to prevent and distinguish between domain squatters and businesses with legitimate business models in place to purchase a gTLD and build a business around it? The need to limit domain squatters is understandable but there is also limitless potential to build businesses around these new domains. J. Springer (19 June 2009).

Rationale for new gTLDs; support for expansion plan, but more clarity needed

ICANN’s reasoning for opening new gTLDs is not convincing and not clear, and there is skepticism from many in the Internet communities. It is agreed that there should be a plan for expansion. ICANN should not be event driven (reacting only to what is being proposed). How frequently ICANN opens new rounds of new gTLDs is not clear (i.e., is it only based on requests by the private sector). It is also not clear how end users’ opinions are being considered. A. Al-Zoman (19 July 2009).

Need to address impact of new gTLDs on countries and communities

ICANN’s proposal does not adequately address the social, economic and technical impacts of new gTLDs on countries and communities, or the interest of Internet users and the entire Internet. Instead ICANN is focused on the number and size of the new domain names. ICANN’s proposal lacks: a comprehensive analysis of economic and competition impacts; business awareness; and an analysis of the risk of end user confusion and/or harm. A. Al-Zoman (19 July 2009).

New gTLDs are not generic any more

New gTLDs should be only for generic names and should not include names—e.g., geographic, community, language, country, brand, etc.) A. Al-Zoman (19 July 2009).
Social/linguistic/cultural and public authority-sponsored TLDs

ICANN should give consideration to the specific need for non-commercial categories of TLDs including social, linguistic and cultural TLDs, and public authority-sponsored TLDs, including appropriate application procedures and financial arrangements, taking into account non-profit operation and developmental objectives. A. Al-Zoman (19 July 2009).

End user trust and confidence

With so many gTLDs in the market, users will lose their faith in the DNS (many similar labels (2nd LDs) with multiple (10s or 100s) TLDs. A. Al-Zoman (19 July 2009).

Process-language barrier

The whole process, including consultations, documentations, forms, communications, people involved) is done in English. Non-English speaking communities would be left behind because of the language barrier. For example, there is a process for English TLDs different from “other” languages’ TLDs; there is a need for a linguistic committee to approve IDN TLDs but it is not needed for English TLDs. ICANN, as an international body, should treat all languages equally, regardless of the location of ICANN’s headquarters. The current technical limitation of the DNS (i.e., ASCII based system) should not deter the support of the “other” languages on an equal footing. A. Al-Zoman (19 July 2009).

Need to define top level domain

ICANN needs to define what is a top-level domain in order to avoid useless squandering of time and financial resources of ICANN reviewers, staff and those of new TLD applicants, and to avoid needless bogging down of the process based on string confusion, misappropriation of community and infringement on the rights of others. The definition should be “the apex of a well-defined human activity, a community or a sector.” The key word in that definition is “apex,” which directly equates to the word “top” of “top-level domain.” This area was well-addressed in the new TLD application process used in the last round of introductions of new TLDs, but is missing from the current DAG and this omission needs to be rectified. Going forward, ICANN staff cannot discard or overlook the core principles used before in adding new TLDs unless it intends to unilaterally abandon the logical expansion of the domain name space that the ICANN community has worked so long and hard to establish from the outset of ICANN’s existence. This would be tantamount to abandoning the bottom up principles upon which ICANN was founded and stands today. Without this critical definition ICANN would open the door to a proliferation of TLDs that would be miniature sub-segments of apex TLDs (e.g., a.nyc as well as a.brooklyn, .bronx, etc.), leading to user confusion at best and without doubt challenges from apex TLDs, unnecessary registrations and pernicious compliance issues.

This issue can be addressed and clarified in the definition of “confusingly similar strings.” The current definition should be expanded beyond the semantic equivalence to also address the diminution of a TLD. This will not only address user confusion but also stop the loss of valuable resources that will be wasted on a myriad of objections that could have been avoided from the start. This issue is in the interest of all stakeholders in the new TLD process, especially trademark holders, those with responsibility for Internet security and stability, ICANN compliance staff and most importantly Internet users now and in the future. R. Andruff (21 July 2009).

Material misrepresentations—ICANN audits of registries

COA called for changes to the draft registry contract in its April 2009 comments to ICANN to ensure that ICANN has full authority to audit registries for material misrepresentations made in the application and for material statements that are no longer true, regardless of whether these
representations concern the relationship to a defined community. COA urges ICANN to respond substantively to this concern. COA (20 July 2009).

**Government and community concerns**

The new gTLD program does not yet respond to all the concerns that governments have. With the new program ICANN is involving itself in an area beyond its mandate. By allowing itself to set some policies to harmonize the whole (Internet) it is intervening indirectly in world cultural issues and worse, is breaching local community harmonies. If local community/country cultural concerns are not treated sensitively, the right for a new gTLD may ignite a civil war in that local community. Local communities cannot depend on objection mechanisms to avoid such a catastrophe. The new gTLD program has a serious deficiency regarding the protection of values that are safeguarded by communities, countries, nations and governments since ancient times (e.g., geographic names, religion values, morality and public order, social security, local trade names/marks, etc.) A. Al-Zoman (19 July 2009).

**III. Analysis**

Since it was founded in 1998, one of ICANN’s key mandates has been to create competition in the domain name market, “The new corporation ultimately should ... oversee policy for determining the circumstances under which new TLDs are added to the root system.” The secure introduction of new gTLDs, as specified in the White Paper, remains an essential element in fostering competition and choice for Internet users in the provision of domain registration services.

The introduction of new gTLDs is identified as a core objective in each of MoUs (1998 – present) and the Joint Project Agreement: “Define and implement a predictable strategy for selecting new TLDs.” The study and planning stages, extending back several years include two trial rounds of top-level domain applications held in 2000 and 2003. Experiences from those rounds have been used to shape the current process.

The policy recommendations to guide the introduction of new gTLDs were created by the Generic Names Supporting Organization (GNSO) over a two-year effort through its bottom-up, multi-stakeholder policy development process. The GNSO approved its Final Report on the Introduction of New Top Level Domains in September 2007 by a 19-1-3 vote, a clear supermajority under the ICANN Bylaws.

Principles guiding the policy development process included that:

- new gTLDs will benefit registrant choice and competition;
- the implementation plan should also allow for IDNs at the top level;
- the introduction of new gTLDs should not cause security or stability issues; and
- protection of various appropriate interests requires objection and dispute resolution processes.

This summarization of comments and the analyses are intended to meet the goals raised in the general concerns above and in the specific issues described below.

**IDN**
I. Key Points

- The topic of management of variant strings and the minimum number of characters in a gTLD string remains under discussion.
  - The proposed reservation of variant TLDs until a delegation function exists that ensures aliased functionality is urged not to apply to gTLD strings in CJK scripts.
  - The proposed required minimum of 3 characters in a gTLD string is considered based on mistaken arguments and requested to be relaxed to allow for shorter strings, in particular for CJK strings.

II. Summary of Comments

IDN variants

JET urges ICANN to implement TLDs with IDN variants, at least for the Chinese, Japanese and Korean strings, according to RFC 3743. Implementation of IDN variants is of utmost importance to these communities as variants are often used interchangeably, similar although not the same, as uppercase and lowercase characters in English. Not implementing RFC 3743 would result in registrants having to pay multiple times for the “same” domain name. *JET (20 July 2009).*

CJK Languages: mistaken arguments in support of 3-character string requirement

The explanatory memorandum on the 3-character string requirement has a series of mistaken arguments in support of requiring 3 “distinct characters” for each gTLD string.

- **First,** the memorandum’s discussion of “fairness of treatment” between CJK based languages and other languages is false. Proposing “equal treatment” in terms of uncomparable measurements is grossly unfair. In any non-ideographic language, there are very few words composed of just 2 characters. By contrast, most words in CJK expressing a generally understood concept are composed of just two ideographs and at least 1,000 often-used Chinese and Japanese words are just one character. In Korean, words appear to a Westerner as one or two characters but in reality these are syllable blocks composed of multiple Jamo characters.

- **Second,** the memorandum is false in arguing in favor of requiring three-character strings by stating that few Chinese characters are words, or that most Chinese words consist of more than one character. The overwhelming majority of words one can find in a Chinese, Japanese or Korean dictionary are composed of what appears as one or two “distinct characters” to a Westerner but which are actually “compound words,” i.e., combinations of full words. It is impossible to see how one could justify imposition of a Western-style “abbreviation” by requiring more characters than the full word!

- **Third,** with regard to the memorandum’s discussion of the suggestion that ICANN perform a trial implementation of a certain small number of gTLDs with less than 3 characters to inform the development of a process for allocating such strings more widely, there are no stability issues to address with such a trial, and requiring such a trial would be a deliberate and malevolent act of discrimination.

- **Fourth,** the memorandum’s statements about issues related to the lack of a model for “translating” TLDs (e.g., two letter ISOs cannot be translated meaningfully into IDN strings of less than 3 characters) are misguided. There is no reason why IDN TLDs should be “translations” of Western (or any other) expressions, and there is no need for them to be
“abbreviations” in the Western sense. In addition, language-to-language translations of TLDs tend to be either hilarious or confusing. A generalized translation-based approach to TLDs is utterly impossible.

- **Fifth**, the concerns cited in the memorandum that delegation of single and two-character labels now might jeopardize the future shape of the ccTLD delegation mechanism do not exist. Mapping codes to names is a compilation effort, not standardization, as the country names exist independently of the standards or documentation authority. The compilation effort is already protected in the gTLD process as country names may only be used with the approval of the relevant government. As a result, there is no imaginable standardization or compilation effort whatsoever that could possibly be “jeopardized” by allowing 2-character or 1-character ideographic gTLDs.

The proper way forward is to adapt the Draft Applicant Guidebook. One solution is to make the minimum length dependent on script. ICANN should also allow the respective language communities to request a minimum string length based on considerations specific to the underlying languages or script. *W. Staub (9 June 2009).*

**CJK three characters problem**

The policy of three or more visually distinct letters or characters is not practical for Chinese, Japanese and Korean. With respect to the discussion in the explanatory memorandum, JET points out the following: (1) On “fairness of treatment” ICANN cannot rely on “character counting” for fairness. It is not unusual to find Chinese or Japanese translation of an English text shorter by a magnitude of 3 times or more by character counts. (2) The statement that “few Chinese characters are words” is wrong. Every well-formed Chinese character, on its own, has a meaning. (3) Regarding the “ICANN ccTLD delegation function,” JET agrees that there is a certain elegance in a simple rule (like reserving two characters for ccTLDs allowing one to immediately identify the type of TLD it is from the string). However, this rule may not be feasible in IDN ccTLDs in the long run (an example given is Singapore in Chinese). In addition, the ccTLD Fast Track Draft Implementation Plan has no restriction that IDN ccTLDs be two characters only. JET is also unaware of any intention from the Maintenance Agency for ISO 3166 country codes to expand the list beyond ASCII character codes. Therefore the three character legacy rule should not be applied to IDN. *JET (20 July 2009).*

“Fairness of treatment” in CNNIC’s view is to enable every person on the globe to have access to the Internet, regardless of race or language. Given the dominance of ASCII characters on the Internet, it is high time to give the fairness treatment to IDNs. The statement that “few Chinese characters are words, most Chinese words are two or more characters” appears to be a misnomer. Each single Chinese character is a word and in some cases can possess multiple meanings. The presence of a second character is then used to clarify this meaning. In fact it is very hard to find a 3 character word in Chinese; this usually exists as “borrowed” words (i.e., translated phonetic pronunciation of an English term). In the East Asian community it is agreed that the 3-character limitation will exclude most meaningful words as a TLD string. This is why CNNIC is repeatedly raising this issue and appealing for the lift of this limitation. *CNNIC (21 July 2009).*

**Community consultation—IDN TLD and removal of three character limitation**

Removing the 3 character limitation would be a major policy decision. ICANN should carefully consult with the relevant communities regarding these IDN TLD issues. *JET (20 July 2009).*
Three-character new gTLD rule questioned

Is it correct that the current position with regard to the new gTLDs is that two character new gTLDs are not allowed (.bp, .bt, .hp, etc.) although ICANN has been presented with counter arguments as to why these rules should be relaxed? R. White (23 June 2009).

III. Analysis and Proposed Position

There have been broad community discussions and opinions on the topics of variant TLD management and allowable number of characters in a gTLD string. These discussions have taken place both online at the designated public comment forum, as summarized above, and in several meetings throughout the ICANN meeting in Sydney. Those discussions indicated that requiring gTLD strings to be three or more characters would hobble the utility of new TLDs in certain languages (such as Chinese, Japanese and Korean) where complete words are routinely expressed in one or two characters. The current position in the Guidebook requires that TLD strings be at least three characters long. This has been interpreted as a requirement for both the A-label, as well as the U-label. The reason for this rule in the past has been to avoid confusion with country code labels. Country code labels are and have been limited to two-character ASCII strings.

Before developing a mechanism for determining which two-letter IDN labels might be delegated, two threshold questions (and some associated issues) must be answered. What is the possibility that a two-letter non-Latin label would be so similar to an ASCII TLD that user confusion would result? What is the possibility and timing that the ISO list will be expanded to include non-Latin scripts?

Preliminary discussions indicate a low possibility that two-letter non-Latin labels would be confused with existing or anticipated ASCII country code labels. Therefore, clear, fair rules for delegating certain two-character labels as gTLDs must in some way avoid confusion by only allowing those scripts that will never result in confusion.

Regarding the second question, there have been many discussions about expanding the ISO lists of country names to possibly include country code names that will be delegated in the Fast Track process, as well as expanding the character set beyond English into other languages. From those discussions it appears that such a process would take many years. Therefore, rules are being developed that comply with the policy work of the GNSO and the IDNC working group and also allow, under certain conditions, the delegation of two-character names in the gTLD name space.

The topic was also discussed during the ICANN Board meeting in Sydney (see http://syd.icann.org/node/3782 for details) and it was decided that ICANN should form a small working group to discuss these two topics and provide the community with their recommendation in time for the ICANN meeting in Korea (25-30 October 2009).

Discussions on possible methods of managing variants at the top-level indicated that restricting variants from being delegated in the DNS root zone might disfranchise certain regions that otherwise would benefit greatly from the introduction of IDN TLDs.

Delegating variant TLDs in the root zone without a mechanism for ensuring that the TLDs are treated in a method that guarantees a good user experience is a stability concern related to confusability for end-users. This can be compared to the “companyname.com” situation, where two domain names (one with all Latin characters and the other with mixed Latin and Cyrillic) look identical, but were different technically. Users clicked on the “wrong” address leading to a
site different than expected. This activity resulted in a change in the IDN Guidelines, requiring
that scripts not be mixed in domain names unless there is a linguistic reason for doing so (i.e., in
the case of Japanese that is represented by mixing of four scripts). This is also a requirement for
TLDs, but does not solve the variant issue.

At the same time, disallowing or blocking variant TLDs means that some users will have a very
difficult time using the IDN TLDs. In some cases it is not possible for the user to know which
character he or she is typing. Some keyboards will offer one or another variant character but not
both. In this way, without the variant TLDs in the root, communities may be getting error
messages when attempting to reach, for example, a web address with a domain name under
one of these IDN TLDs. This is not the intent IDN deployment. Rather, the objective is to help all
communities have equal access to the Internet.

Not all variants are visually confusing. To maximize benefit, ICANN attempted to define variants
in a narrow manner, only including variants that are visually confusing. The intent was allow
variant TLDs be delegated in the DNS root zone that are not confusing with others while a stable
solution was found to address the variants that are similar.

At this time though, it is an open question whether stability issues include variant TLDs that look
different, and are typed differently, but are used interchangeably for the same term by the
users.

Another open question is the content of an agreement between the IDN TLD operator and
ICANN requiring that registrations under the two variant TLDs be handled (say, in a bundled or
aliased manner, following RFC3747, or a different technical solution) in a certain manner.

Finally, there is the question of whether it is necessary to enforce rules required for the
development of IDN Tables. IDN Tables hold information about the characters that should be
treated as variants. The TLD operators develop IDN tables. Presently, TLD operators are urged to
consider linguistic and writing system issues in their work of defining variants, and cooperate
with other TLD operators that offer the same or very similar looking characters. This is not
always practically possible, and there are currently no rules about defining variants. There also
are no defined dispute mechanisms in cases where communities may disagree on a variant
definition.

The working group has been formed and is working on the two topics under the charter
proposed during the Sydney Board meeting, and plan to publish their recommendation prior to
the Korea meeting. This will include a plan for releasing two-character labels in some form so
that Internet use is not hobbled.

**TRADEMARK PROTECTION**

**I. Key Points**
- Significant community discussion has occurred and several consultation sessions have been
  conducted concerning trademark issues.
- Several solutions to potential trademark issues are proposed in this version of the
  Guidebook and in separate documentation posted for community comment.
II. Comment Summary

Added protection
There needs to be more effective protection for intellectual property rights including local ones. A. Al-Zoman (19 July 2009).

III. Analysis
In response to comments to the first applicant Guidebook the Board formed the Implementation Recommendation Team (IRT), asking them and others to develop specific solutions to address the issue raised in this comment. As a result, several specific solutions have been published for public comment and discussed in depth in public consultations held in Sydney, New York and London. The results of the public comment forum and the transcripts of the consultation sessions have been summarized and published under separate cover. Analysis of those solutions and the comment summaries has led to recommendations for implementation of certain specific rights protection mechanisms into the proposed Applicant Guidebook or, alternatively, as models for further discussion.

Please refer to companion documents to see this analysis regarding the IRT recommendations.

EVALUATION

I. Key points
- Community status requirements are more detailed.
- Background information and security requirements for applicants are strengthened.

II. Summary of Comments

Community-based designation
Question 24 should provide greater transparency and detail regarding claims of community status. That should enable potential objectors to make more informed decisions about whether to invoke the community objection procedure and also facilitate the comparative evaluation/community priority process, if applicable. IPC (20 July 2009).

Applicant background—support for requiring more transparency
IPC applauds the proposal to require greater transparency about new TLD applicants. The drafted questions should be reviewed and broadened where necessary to ensure that they capture the needed information. For example: (1) information should be requested regarding all partners of an applicant that takes a partnership form; (2) ICANN should inquire about criminal or fraudulent activities of the officers of entities (e.g., corporations) that hold a significant interest in the applicant; (3) Criminal record disclosures should not be limited to financial or fiduciary related crimes, but at a minimum should cover all felonies; (4) Disciplinary actions by governments should not be limited to those imposed by the relevant person’s or entity’s domicile; (5) Question 11(f) should be rephrased to cover all allegations of intellectual property infringement “in connection with the registration or use of” a domain name; (6) The notes should spell out that all applicants will be subject to a background check, and that false, misleading or materially incomplete responses will be grounds for rejection of the application. IPC (20 July 2009).
Corporate gTLDs should be recognized as a category, although a different label might be used
COA continues to believe it would be beneficial and efficient to recognize a category of gTLD applications open for registration only by persons or entities standing in a specified relationship with a particular company (e.g., employees, suppliers and/or distributors). Under the current typology, many such applicants may be tempted to “shoehorn” their applications into the community TLD category, but this is not the intended purpose for the community category and could have inadvertent detrimental consequences for legitimate community applicants. Given that the ICANN staff responded to this proposal by concluding that the ICANN community should continue to discuss TLD categories, COA would welcome guidance from ICANN about when and where further discussion of this issue will take place and how it might be brought to a substantive conclusion prior to when the applicant guidebook takes final form. COA (20 July 2009).

Security policy
IPC commends ICANN for recognizing in Question 36 that “due to the nature of the applied-for gTLD string” some applicants may be expected to meet higher security standards than would be the case for other, less sensitive strings. Also, IPC is pleased with the statement that “certain financial or industry-oriented TLDs” may require stronger safeguards (e.g., this category should include TLD strings referencing industry sectors associated with high levels of online intellectual property infringement, and that the security and other policies of applicants for such strings should be expected to include adequate safeguards against such illegal (and in some instances criminal) activities). In any event, the criterion that the applicant demonstrate “security measures appropriate for the applied-for gTLD string” is an important and potentially valuable addition to the evaluation process. IPC (20 July 2009).

Whois (question 38)—improvement incentives for new registries
ICANN should take this opportunity to provide incentives for new registries to take on some of the responsibility for ensuring that the ICANN-accredited registrars which they employ to sponsor registrations live up to their obligations regarding Whois: e.g., encourage registrars to take proactive steps to improve accuracy of Whois data; that they consistently cancel registrations of those who supply false Whois data; and, if they provide proxy or private registration services (if allowed by the registry), that they include and implement a process enabling copyright or trademark owners with reasonable evidence of actionable harm to obtain access to the actual contact data of registrants. Registries committing to these policies should receive extra points in the evaluation process. IPC (20 July 2009).

Funding and revenue (question 52)
Confirmation is requested regarding whether an “Exceeds Requirement” score can be achieved by satisfying one (not both) of the second or third criteria, in addition to satisfying the first and fourth criteria. eNOM (21 July 2009).

III. Analysis
A comment suggests refining a question regarding claims of community status with more details. Although the Guidebook question is fairly detailed, it is agreed that additional detail will improve transparency and facilitate community priority evaluation, if such a case arises. Accordingly, staff has specifically reviewed the drafting of this question to seek to improve clarity in these regards for the next version. In particular, the applicant is asked to provide more detail regarding aspects of the community representations and detail about the structure of the
representative organization. There is additional information required to describe the nexus between the applied for name and community. See the Guidebook for complete information.

ICANN’s work with the community on mitigating potential malicious conduct through increased application scrutiny is described in an explanatory memorandum published coincident with this work. Changes have been made to the Guidebook, in accordance with the comments provided here. Partners are included in those required to provide information; it is believed that entities holding a significant interest are shareholders (including corporations) and shareholders are required to present information about prior criminal activity – it is not considered practical however to inquire about officers of shareholders in all cases as there could be a cascading effect; the list of crimes to be disclosed does include all felonies and also includes misdemeanors involving financial or fiduciary related crimes; disciplinary actions by governments are no longer limited to those imposed by the relevant person’s or entity’s domicile; Question 11(f) has been broadened rephrased to cover all allegations of intellectual property infringement in connection with the registration or use of a domain name; the terms and conditions include and module 1 has been augmented to note that all applicants may be subject to a background check, and that false, misleading or materially incomplete responses may be grounds for rejection of the application. ICANN may not conduct the check in all instances but puts the applicant on notice that it may be conducted.

Significant consideration has been given to the issue of the introducing category-based TLDs in the new gTLD process. The policy recommendations of the GNSO and the GAC principles have resulted in the creation of three gTLD categories or types:

- Community-based TLDs
- Geographic Name TLDs
- Everything else (called standard or open TLDs)

Community comment suggests the creation of several TLD categories: for example, single-owner, country, intergovernmental organization, socio-cultural, community and open. Depending on the category, various accommodations are suggested: for example, no requirements for an ICANN contract, or to use accredited registrars, or to follow consensus policy, or policy provisions outlined in the GAC’s ccTLD principles. Some might be restricted to not-for-profit status, be eligible for reduced fees, require registration restrictions, and have names reserved in anticipation of registration by certain parties.

Beyond the accommodations sought, many or all of the suggested categories seem to be variations of community-based TLDs. The preference for community-based TLDs in the evaluation/contention process is based on policy advice from the GNSO and is intended to ensure that community-based applicants receive the TLD string to which their community is strongly related. Perhaps the most important aspect of the suggested categories is that an applicant within these categories does, in fact, receive the string associated with its community, and that is what the existing process is designed to do.

The introduction of a number of new gTLD categories with a number of different accommodations will lead to a complex and difficult application, administration and evaluation process, in addition to a very complicated contractual compliance environment. Additionally, there will be considerable debate and discussion in the community as to whether certain accommodations should be made. Should certain gTLDs not be required to have an agreement with ICANN or not be required to follow consensus policy? Should certain TLDs be required to
maintain not-for-process status? These discussions and debates will take considerable time and resources and may ultimately not result in consensus.

The structure of TLD categories, if granted different accommodations with differing contractual obligations, would result in significantly higher compliance costs and therefore, annual fees.

ICANN is a strong proponent of innovative use of new TLDs. This is especially so in cases where TLDs can be delegated to address the needs of specific communities such as intergovernmental organizations, socio-cultural groups and registered brands. Rather than having ICANN limit this type of innovation and identification with certain TLD models, more creativity might be spawned by allowing different groups to self-identify the type of TLD they purport to be and promote that model among their community. If a self-declaration program is instituted and contractual accommodations are eliminated or minimized, fees can remain constant. Socio-economic groups, brand owners and other groups can be accommodated under the existing structure and self-identify as a particular type of TLD. Over time, the market and community interests will sort TLD types — a model preferable to having ICANN make that determination a priori.

It may well be that as definitive categories of applicants emerge in practice, and as ICANN and the respective communities gain further experience of possible benefits of additional gTLD categorization over time, organizational structures might be developed with ICANN to reflect these categories. That will be a consequence of bottom-up policy developments by affected participants, according to the ICANN model. Nothing in the current implementation procedures forecloses those future developments.

In the case of security: an applicant for a new gTLD might have the option of taking steps to gain a verified high security zone status by meeting a set of requirements additional to those that are in place for all applicants. If achieved, this status would allow the new gTLD registry operator to display a seal indicating that it is verified as a high-security zone, to enhance consumer awareness and trust. The processes required to achieve verification include verification of both registry operations and supporting registrar operations. The verification assessment is performed by an independent entity, external to the gTLD evaluation process.

These high security zones will contribute to increased reliability and accuracy of Whois — the registrar must actively monitor and authenticate the accuracy of Whois data.

Regarding the question whether an “Exceeds Requirement” score can be achieved on the specified application question by satisfying one (not both) of the second or third criteria, in addition to satisfying the first and fourth criteria – all four criteria must be satisfied in cases where they apply. Some applicants may have all funding from existing sources or all from projected revenue – it which case only the second or third criterion apply. It is case specific.

**GEOGRAPHICAL NAMES**

**I. Key Points**

- At the second level, registrations of specific representations of country and territory names (i.e., in official lists), require a .info style of approval for release from reservation.

- Top-level registrations of certain regional and sub-regional names, country and territory names, and capital city names require the approval (or non-objection) of the relevant governments.
II. Comment Summary

Concern about definition of geographical names

eNOM generally endorses the additional clarity and guidance on geographic names, but is concerned that the phrase “in any language” that applies to country, territory and capitol city names at the top level may cause unintended consequences. It could create situations where an applied for string is a widely and commonly used (non-geographic) term in its own language but is also an “exotic” translation of a geographic term in some other language (“exotic” meaning the translation is in a language not commonly used in the country/territory the DAG provision is trying to protect). It causes unpredictability as applicants cannot identify all possible language variations of all countries, territories and capitals. It may result in a commonly used term in one language being denied to Internet users of that language because the term is also an exotic translation of a geographic place. In order to mitigate this situation, the DAG should be modified to give the Geographic Names Panel discretion to allow a string to proceed in certain circumstances (suggested language: “If the applied for string is a common generic word and, in the judgment of the Geographic Names Panel the translated language is of peripheral relevance to the designated country, the Panel can recommend that the requirement for obtaining Government approval be waived—except the relevant Government can still file an objection to the waiver”). eNOM (21 July 2009).

Country names and territory names on the ISO list should be treated as ccTLDs

To allow the “given names” of countries to be defined as generic (and thus delegated as gTLDs) is illogical and incompatible with any normal understanding of the term generic. Allowing a TLD that is a meaningful representation of a country to be a gTLD is likely to involve ICANN in the internal policy of a country. It is highly likely that the government will at some stage want to have policy input into what a country TLD is used for or expect it to be answerable under national law. A change in government could radically affect the official position within the country about the gTLD which could adversely affect the stability and security of the DNS. There will also be significant confusion caused for Internet users if some country names are ccTLDs under local law and with local policies while others are gTLDs bound by ICANN policy processes (e.g., registrar accreditation, dispute resolution and Whois). ccNSO Council (6 July 2009). The main concerns of UNINETT Norid AS about geographical names are not reflected in the third DAG draft. The principle repeatedly set forward by the ccNSO Council – that all country names and territory names are ccTLDs, not gTLDs—has not been taken into account. UNINETT Norid AS fully supports the ccNSO’s input and requests that it be given serious consideration when revising the DAG version 3. UNINETT Norid AS (6 July 2009).

Concern about blurring of ccTLDs and gTLDs

Introducing new gTLDs for geographic names or languages will blur the difference between ccTLDs and gTLDs and make setting new different policies for ccTLDs and gTLDs more difficult. A. Al-Zoman (19 July 2009).

National and public policy interests

ICANN needs to ensure respect for national and public policy interests, including the need for adequate protection of geographic names and delegation/re-delegation procedures. A. Al-Zoman (19 July 2009).

ICANN policy to protect geographical names—interference with legal rights of businesses

ICANN is making new international law which will wrongfully interfere with the legal rights of businesses. E.g., could ICANN explain on what basis it can deny an application by Bern
Unlimited, LCC which owns a number of national trademark registrations with the word mark BERN? Now multiple national governments are granting this business the legal right not only to use the mark in commerce but to protect it against others using it in a confusingly similar manner. However, under ICANN’s proposed rules this business will be prohibited from applying for a TLD if the Swiss government does not give its approval or non-objection. M. Palage (21 July 2009).

**Concerns about defining country names and territory names (DAG Section 2.1.1.4)**

The current formulation proposed for defining country names does not cover the same terms that were protected by the earlier definition of “meaningful representation.” Acknowledging the desire for a defined list, it is also important to keep the fundamental principles associated with national sovereignty firmly in view. Lists can often easily be circumvented and not respond to reasonable expectations from the governments or users based in the country concerned. New gTLD applications will not be processed automatically so there is no need for a defined list. The list creation formula itself is very complicated. Parties not currently involved in this process will not yet have had the opportunity to check that all meaningful representations of their country names are properly protected in these lists. ccNSO Council (July 2009). In DAG Section 2.1.1.4., the definition of which strings are counted as country names has changed significantly and does not cover the same terms that were protected by the earlier definition of “meaningful representation.” The basic problem of a defined list is that it can be circumvented or may not cover what was intended by the broader definition of “meaningful representation.” (The two islands of Svalbard and Jan Mayen, and Bouvet Island, are examples of a country/territory that experiences problems with the new definition.) UNINET Nord AS requests reinstatement and expansion of the previous definition of “meaningful representation” of a country or territory name according to the comments submitted in April 2009 by the ccNSO Council. UNINETT Norid AS (6 July 2009).

**Country/Territory Names—support for safeguards**

IPC supports in principle the concept of safeguards against use at the top and second levels for certain country and territory names, identified through objective criteria, even though these names do not enjoy specific protected status under international treaties. This concept is fundamentally the same as the one underlying the Globally Protected Marks List proposed by the IRT. IPC notes that in Section 2.1.1.4, safeguards would also apply to “permutations or transpositions” of country names. While examples are provided for permutations, none is provided for transpositions. It is difficult to evaluate the proposal without a further explanation of those terms. If a broad interpretation were given to those terms, it could improperly expand the scope of the safeguards. IPC (20 July 2009).

**Second level country and territory names protection**

eNOM supports the proposed expansion of reserved names in Module 2 to include initial protection of country and territory names at the second level. This new contract provision satisfies the GAC Principles Regarding New gTLDs as related to geographic names. eNOM (21 July 2009).

**Section 2.1.1.4.1—expansion of geographical names, including ISO 3166-1 alpha-3 codes**

GoDaddy opposes inclusion of ISO 3166-1 alpha-3 codes in the definition of geographical names: first, the alpha 3 codes are not as widely used or recognized as country or territorial abbreviations, as compared to the related alpha-2 codes. Most international users, and even many residents of a given country or territory, often do not associate the alpha-3 code with that country; second, reserving alpha-3 codes as geographic names will potentially collide with many...
well-known (and often unrelated) companies, organizations, and entities that use the identical string as an acronym, abbreviation or ticker symbol, and may wish to use them as gTLDs (examples provided in comments text). Other strings in the alpha-3 list would be significantly more recognizable as potential top-level domains than the countries they represent (examples provided in comments text). GoDaddy (20 July 2009).

Adherence to GAC principles

ICANN should adhere to GAC principles in general, and also adopt the following specific principles: New gTLDs should respect the sensitivity about terms with national, cultural, geographic and religious significance; ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant government or public authorities. A. Al-Zoman (19 July 2009).

III. Analysis

Country and Territory Names

Definition of country and territory names

The ccNSO has raised concerns that some terms that were protected under the ‘meaningful representation’ definition are no longer afforded protection, and that it is important to keep the fundamental principles associated with national sovereignty firmly in view. Conversely, GoDaddy has raised concerns that the revised criteria is too far reaching, particularly the inclusion of the alpha-3 codes. However, it is likely that an alpha-3 code representing a country or territory would have been considered under the previous definition as a “short-form designation for the name of the country or territory that is recognizable and denotes the country or territory”. This was previously noted on page 53 of the Analysis and Public Comment, February 2009 document, which states, inter alia, “…the definition of meaningful representation of a country or territory name includes short-form designation of the name of the Territory. This could include three letter country codes such as .AUS for Australia and .AUT for Austria.”

These comments illustrate the Board’s concern that the criteria for country and territory names, as it appeared in version 2 of the Draft Applicant Guidebook was ambiguous and could cause uncertainty for applicants. Subsequently, on 6 March 2009, the ICANN Board directed staff to, among other things, “… revise the relevant portions of the draft Applicant Guidebook to provide greater specificity on the scope of protection at the top level for the names of countries and territories listed in the ISO 3166-1 standard.”

The revised definition continues to be based on the ISO 3166-1 standard and fulfills the Board’s requirement of providing greater clarity about what is considered a country or territory name in the context of new gTLDs. It also removes the ambiguity that resulted from the previous criteria that the term meaningful representation created.

The Board’s intent is, to the extent possible, to provide a bright line rule for applicants.

While the revised criteria may have resulted in some changes to what names are afforded protection, it has not changed the original intent to protect all names listed on the ISO 3166-1 list, or a short or long form the name. It is felt that the sovereign rights of governments continue to be adequately protected as the definition is based on a list developed and maintained by an international organisation. In addition to the protections provided in the applicant guidebook, the objection process does provide a secondary avenue of recourse. An application will be
rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted.

The IPC noted its support in principle for the concept of safeguards against the use, at the top and second level, of certain country and territory names. However, a question was raised about what is a ‘transposition’ of a country or territory name given that no example is provided in the guidebook. Transposition is considered a change in the sequence of the long or short–form name, for example, “RepublicCzech” or “IslandsCayman.”

As stated in the comments, it is acknowledged that the translation of country or territory names ‘in any language’ may provide some uncertainty for applicants given the absence of a comprehensive list. However, the proposed solution suggested by eNom is considered to be inconsistent with the intention to respect the sovereign rights of governments in the process. In the event that the Geographic Names Panel determines that a string is a translation of a country, territory or capital city name in any language, it is not considered appropriate to provide the GNP with the discretion to waive the requirement for obtaining government support or non-objection if, as suggested, the panel also considers that the ‘translated language is of peripheral relevance to the designated country’. It is only the relevant government or public authority that rightfully has the discretion to make that decision.

In circumstances where the applicant did not know that the string requested represented a country or territory name in another language, the applicant will be given 60 days to contact the relevant government or public authority to acquire the necessary support or non-objection to the use of the string.

A resource document available to applicants is a list of country names in their respective official language/s and translation in the 6 official UN languages prepared by the Working Group on Country Names of the United Nations Conference on the standardization of Geographical Names

**Blurring the distinction between ccTLDs and gTLDs—should country and territory names be treated the same as ccTLDs**

The ccNSO and other ccTLD managers have raised concerns that allowing applications for country and territory names in the gTLD process will blur the distinction between ccTLDs and gTLDs. Further, it is asserted that to allow the ‘given names’ of countries to be defined as generic (and thus delegated as gTLDs) is illogical and incompatible with any normal understanding of the term generic. They have requested that applications for country and territory names not be allowed in the gTLD process, at least until the completion of the IDN ccTLD PDP, which will address this issue. The current timetable for the completion of this process is mid 2011. Comments received from others support the notion of country and territory name applications being allowed under the gTLD process.

While understanding the concern that it is important to maintain the distinction between a ccTLD and a gTLD, there is also anticipation that governments may want a .country name TLD. With the exception of names allowed under the IDN ccTLD fast track, this is only possible under the new gTLD process, under very specific circumstances. With regard to concerns that a country name is not a generic term, in the context of ICANN terminology, a ccTLD has
traditionally been referred to as a two letter\(^1\) country code TLD while most TLDs with three or more characters\(^2\) are referred to as "generic" TLDs, or "gTLDs". At the time the DNS hierarchy was developed, the number of characters was the distinguishing factor between a ccTLD and a gTLD. To date, there has been no community agreement on whether there is a need to redefine these terms.

The treatment of country and territory names, in version 2 of the Draft Applicant Guidebook was developed in the context of the points raised by the GAC, the ccNSO, and the GNSO policy recommendations. Applications for country and territory names will require evidence of support or non-objection from the relevant government or public authority, which is consistent with GAC principle 2.2\(^3\), and that evidence must clearly indicate that the government or public authority understands the purpose of the TLD string and the process and obligations under which it is sought.

Geographic names were discussed during the GNSO Policy Development Process, and while two letter TLDs are not available in the new gTLD process in recognition of the possibility of new ccTLDs, the GNSO Reserved Names Working Group did not find reason to protect geographic names and considered that the objection process was adequate to protect a geographic name, while the GAC considered that such terms should be avoided unless in agreement with the relevant governments or public authorities.

The treatment of country and territory names in the gTLD process has been developed to provide safeguards to ensure that the relevant government or public authority’s sovereign rights are respected, and that the process is understood. It is ultimately the government or public authority’s discretion whether to support or not support an application for a country name TLD, and circumstances under which they would be willing to do so.

**Capital City Names**

A concern has been raised that ICANN is making new international law because TLDs which contain capital city names will require the approval of relevant governments. ICANN has sought to protect the geographic name only, for example the name of the city or the country or territory. Citing the example used in the comment received, a business wishing to apply for .bernunlimited would not require the support of the Swiss government. However, an application for .bern would require the support or non-objection from the relevant Swiss government or public authority.

**OBJECTION PROCESS**

**Procedures**

**I. Key Points**

- ICANN agrees that it is important to encourage the DRSPs to consolidate objections whenever possible and is reaching out to the DRSPs to do just that.

- ICANN is communicating with the DRSPs to ensure a process is in place whereby a running list of objections will be made public throughout the objection period.

\(^2\) [http://www.icann.org/en/general/glossary.htm#G](http://www.icann.org/en/general/glossary.htm#G)

\(^3\) ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities
II. Summary of Comments

Government/Country Objection Procedure—cost and complexity

The cost and complexity of the objection procedure and implications of the proposed procedure for governments to submit objections based on, e.g., morality and public order grounds, should be taken into consideration. Some countries are not represented in ICANN and might not learn about problematic domain names in a timely manner to be able to object. A. Al-Zoman (19 July 2009).

Running list of objections

COA is pleased that ICANN will consider and discuss with the DRSPs a process whereby by a running list of objections is published as objections are filed during the filing period. This could minimize the risk of needless duplication in objection procedures. This should be spelled out as a requirement in the final version of the applicant guidebook. COA (20 July 2009).

Community Objection Procedures—consolidation of challenges

COA looks forward to how encouraging the DRSPs to allow for consolidation of challenges will be operationalized in the final version of the applicant guidebook and whether it is specified (as it should be) that this encouragement applies to consolidation of objections filed by the same party against multiple applicants for the same or highly similar character strings. COA (20 July 2009).

Community objection—procedural problems not addressed

The proposed changes do not address procedural problems with the community objection process, including doing more to encourage consolidation of objections filed by the same party against multiple applicants, publishing a running list of objections received, and providing greater predictability on fees. IPC (20 July 2009).

III. Analysis and Proposed Position

Comments received relating to objection procedures involve a running list of objections, consolidation, government awareness, and the costs and complexities of the objection process in general.

ICANN has sought to create an objection process that is fair and reasonable in cost, taking into account the legitimate interests and expectations of applicants, potential objectors, and other members of the community. The institution of an Independent Objector is designed, in part, to account for the anticipated reluctance of some governments to participate in the objection process.

In terms of awareness, the new gTLD program has been widely publicized, and specific publicity campaigns are planned for the actual launch of the program. Thus a government does not necessarily need to be represented in ICANN (although all participation is certainly welcome) to learn about the program. With a reasonable amount of attention, governments and other interested parties will learn about gTLD applications in a timely manner.

ICANN has agreed that it will encourage all providers to allow for consolidation of objections to the extent possible, but it will be up to the DRSPs to make the final determination. It should be recognized, however, that multiple applications for different community-based gTLDs may not present the common issues of fact and law that make consolidation appropriate.
ICANN does intend to work with the DRSPs to publish a running list of objections as they are received rather than waiting until all objections have been filed.

At this time, it is difficult to predict the actual amount of fees for community-based objections. With experience, it may be possible to provide more information and some greater degree of predictability.

**COMMUNITY-BASED OBJECTIONS**

I. **Key Points**

- Eliminating the “detriment” requirement by way of presuming it simply by the filing of an objection appears aimed at giving certain objectors with standing a veto power over applications. Such a power is not the envisioned result of the objection process.

- If an objector represents a different community than the applicant but has not applied for the gTLD, there appears no legitimate reason why that objector should be entitled to prevent an applicant that can satisfy the community standing requirements from obtaining the gTLD if no harm to the objector can be shown.

II. **Summary of Comments**

**Community objection—changes endorsed**

eNOM endorses the changes made to the community objection section in Module 3. They more clearly align this form of objection with the objective of community—i.e., to prevent the misappropriation of a string that uniquely or nearly uniquely identifies a well-established and closely connected group of people or organizations. eNOM (21 July 2009).

**Community Objection—detriment and level of recognized stature or weight among sources of opposition**

COA reiterates its view (also supported by IPC) that when a challenger has shown that it meets the criteria of community delineation, substantial opposition and targeting, detriment should be presumed, unless the applicant can show otherwise. A legitimate community representative is in the best position to determine whether its community will be harmed by recognition of a gTLD that targets it. Regarding ICANN’s proposal to take into account the “level of recognized stature or weight among sources of opposition,” COA urges that the representative nature of community institutions be considered as a factor here (i.e., an entity authorized to speak by a large number of individuals or entities should be accorded a high “level of recognized stature or weight”). COA (20 July 2009). IPC appreciates the clarification of section 3.4.4 that a “community” may be composed of legal entities (including business groups), not just individuals. One overarching problem with the objection criteria is the definition of “detriment” that an objector must show; it evidently does not include harm that may result from granting another party exclusivity in the proposed community-based gTLD string, particularly in the situation where multiple parties may be able to claim to speak for significant portions of the community. Any representative institution with sufficient standing to bring an objection should be rebuttably presumed to risk suffering detriment if the challenged TLD is awarded to the applicant. The detriment requirement should also be clarified to address cases where the objection is based either on the applicant’s lack of standing to represent the community or the legitimacy of the community definition itself. In such cases, a detriment showing should not matter because the complaint presents threshold issues that should be subject to review on a complaint from any party with a good faith belief that it would be harmed, whether or not that harm falls into the detriment categories in section 3.4.4. IPC (20 July 2009).
Complete defense clarifications

IPC commends the “complete defense” clarifications in section 3.4.4, especially that the applicant has the burden of demonstrating this defense, and ensuring that it cannot be invoked by an “open TLD” applicant. However, it should be further reviewed—the rules are much too strongly biased toward granting the gTLD to the first to apply for it, a result that could end up harming the communities that the rules purport to protect. IPC (20 July 2009). ICANN’s explanation of why the “complete defense” is needed does not explain why it could be invoked by an applicant even if no other community-based application for the same string had been received, or even if the challenger represents a community that is defined completely differently from the community defined by the applicant. Even in the circumstance ICANN uses to justify the need for the “complete defense,” all it does is shift the locus of judging relative legitimacy from the community objection DRSP to the “comparative evaluator” at a later stage in the process. COA urges ICANN to reconsider the “complete defense” and modify it so that proof of the applicant’s (hypothetical) standing to bring a challenge is only one factor to be considered by the DSRP in resolving a real community objection challenge. COA (20 July 2009).

Community objection—standing

COA does not object to the proposal to state that determining standing will be the result of a balancing of factors (proposed amended section 3.1.2.4), but its inclusion underscores the need for greater clarity and specificity on the issue of standing in the final version of DAG v.3. It would be enlightening to all parties to provide examples of challengers who may possess or lack standing. It should be possible to provide examples that use existing strings, so as not to prejudice any future application or any challenge thereto. Established trade associations or memberaffiliate organizations for a particular creative or economic sector must be assured of standing in this community objection process. COA also urges ICANN to spell out how organizations can join together to file objections and cumulate their qualifications for standing purposes. COA (20 July 2009).

Unfair burden shift to communities

The new gTLD objection process shifts responsibilities from ICANN to the communities, when it is ICANN’s duty to make sure that communities are not hurt by the introduction of new gTLDs that would cause havoc. Communities will have to continuously monitor ICANN’s processes to prevent harm to a community’s values from introduction of a new gTLD. This model cannot be used to deal with many morality and public order issues across the board, and would put some communities on high alert and they might not wait for ICANN to pass a verdict on a new gTLD. A. Al-Zoman (19 July 2009).

III. Analysis and Proposed Position

ICANN appreciates the time that the community has spent on reviewing the community objection process. ICANN has paid close attention to comments received and, as has been recognized, has made some significant revisions in view of many of the comments. As summarized above, the most recent comments, some of which previously have been stated, relate to detriment, available defenses, factors to consider relating to opposition, standing and burden shifting.

Proof of detriment is an essential element of the Community Objection process. Mere opposition to an applicant and its applied-for gTLD should not be a sufficient basis for presuming detriment. Thus, it is correct that detriment “does not include harm that may result from granting another party exclusivity in the proposed community-based gTLD string, particularly in
the situation where multiple parties may be able to claim to speak for significant portions of the community.” If several parties are able to claim to speak for significant portions of a community, each may be entitled to apply for a community-based gTLD, and there are procedures in the new gTLD program for determining which applicant in this situation will be successful. Eliminating the “detriment” requirement by way of presuming it simply by the filing of an objection, appears aimed at giving certain objectors with standing a veto power over applications. Such a power is not the envisioned result of the objection process. If an objector with standing can prove “detriment” and satisfy other criteria, its objection may prevail. If a party considers itself equally or more entitled to speak for a given community, that party may apply for a community-based gTLD – and eventually enter the string contention stage with another applicant, if necessary.

The complete defense is appropriate “even if no other community-based application for the same string had been received, or even if the challenger represents a community that is defined completely differently from the community defined by the applicant. If the objector represents a different community but has not applied for a gTLD, there appears no legitimate reason why that objector should be entitled to prevent an applicant that can satisfy the community applicant standing requirements, and is doing no harm, from obtaining the gTLD. The rules do favor those who apply for a new gTLD; there is a presumption that a qualified applicant will be granted the gTLD. As is typical in disputed matters, objectors bear the burden of proving why, according to certain stipulated criteria, the application should be rejected. However, the rules do not necessarily favor the first applicant to apply within a given round, which is evidenced by the string contention stage of the application process.

In terms of opposition, ICANN sees no prohibition against the DRSP panel considering “the representative nature of community institutions” (i.e., an entity authorized to speak by a large number of individuals or entities) as a factor in analyzing opposition. It seems appropriate that the “level of recognized stature or weight among sources of opposition” afforded by the panel will likely depend on the particular facts or circumstances.

ICANN has developed an objection process that is meant to be as open and transparent as possible by providing relevant factors for consideration of standing. ICANN does not think it appropriate to provide examples of what individuals or entities might have standing to object, as it should be left to the DRSP panels in light of the established criteria; the facts and circumstances are unique to each situation.

While ICANN will enforce obligations undertaken by the registry operator in its agreement with ICANN, it is not ICANN’s duty to supervise the operation of new gTLDs and to ensure that communities are not hurt by those gTLDs.

**MORALITY AND PUBLIC ORDER**

I. **Key Points**

- It would be inconsistent with the universal dimension of M&PO objections for a narrowly defined injury or potential harm, to serve as a basis for standing.

- ICANN recognizes that the dispute resolution procedure should discourage and limit objections that are manifestly unfounded and/or an abuse of the right to object and is working on developing standards to ensure such objections are dealt with quickly and efficiently.
II. Summary of Comments

**Morality and Public Order Objections—frivolous complaints**

ICANN needs to pursue this area with caution, especially with respect to standing requirements so as not to open up the process to challenges based on specious grounds or for purposes of harassment. Standing requirements tied to consideration of injury or potential harm to the complainant are less vulnerable to such abuse. A process for screening out frivolous objections could be indispensable. It is not clear if there is a penalty for filing a frivolous morality and public order objection that is rejected at the initial stage. ICANN should consider how to penalize complaints deemed frivolous on initial review (e.g., forfeiture of filing fee) in light of the potential for abuse and the potential chilling effect of morality and public order objections on controversial communications. *IPC (20 July 2009).*

**Morality and Public Order objection—quick look review to deter frivolous and malicious objections**

The significant broadening of standing to object is likely to increase the incidence of frivolous or malicious objections. eNOM strongly endorses the idea of a “quick look” review to reduce the need for full dispute proceedings in such cases. During “quick look” the DRSP could deny an objection where the applied for TLD is very clearly not in breach of the standards in DAG section 3.4.3. An objector found to be frivolous or malicious should not have any portion of their objection fee refunded. *eNOM (21 July 2009).*

**Morality and Public Order Objection—harassment and suppression of speech; independent objector**

ICANN must also recognize that non-frivolous objections may be made to harass and to suppress speech. The possibility for such abuse means that standing grounds should be defined narrowly to reduce bad faith but non-frivolous complaints to the extent practicable. The independent objector is empowered to take action against “highly objectionable” gTLD applications on morality and public order grounds, which should act as a sufficient check on obviously problematic gTLDs. *IPC (20 July 2009).*

III. Analysis and Proposed Position

ICANN appreciates the comments and agrees that balancing needs to occur with respect to standing to file Morality and Public Order (M&PO) based objections and trying to discourage frivolous objections. As stated below, provisions will be added to the Procedure to empower the Panel to dismiss objections that are manifestly unfounded and/or an abuse of the right to object at an early stage of the proceeding (the quick look review).

The rationale for M&PO objections and the standards that will be applied in the dispute resolution process must be borne in mind when considering this proposed rule of standing. The relevant GNSO policy recommendation refers to generally accepted legal norms that are recognized under international principles of law. The specific grounds upon which an applied-for gTLD may be considered contrary to morality and public order have been identified because they are very widely accepted.

It would be inconsistent with the universal dimension of M&PO objections to narrowly define injury or potential harm, as providing a basis for standing. The harm that is done by incitement to violent lawless action; by incitement to discrimination based upon race, color, gender, ethnicity, religion or national origin; and by incitement to child pornography or other sexual abuse of children extends far beyond the direct or immediate victim of the offense.
If an applied-for gTLD were to constitute incitement to violent lawless action against some person or group of people, it is not only the victim(s) of that action who would have a legitimate interest in preventing the crime. An applied-for gTLD that incites hatred or discrimination against, say, A or B is not merely harmful to A or B. Every person is (or should be) concerned by such incitement. It would surely be inconceivable to allow only A to object to the applied-for gTLD <.killA>, and only B to object to <.killB>. Similarly, it would be difficult to defend – or even to formulate – a rule that grants standing to some and denies standing to others to object to the incitement or promotion of child pornography.

These considerations, along with other practical issues, have led to the decision to grant standing to any person to file a Morality and Public Order Objection. At the same time, ICANN recognizes that the dispute resolution procedure should discourage and limit objections that are frivolous, manifestly unfounded and/or an abuse of the right to object. ICANN points out that the New gTLD Dispute Resolution Procedure already provides that the losing party shall pay the full costs of the procedure. In addition, provisions will be added to the Procedure to empower the Panel to dismiss objections that are manifestly unfounded and/or an abuse of the right to object at an early stage of the proceeding (the quick look review).

ICANN does not consider that rules of standing are the appropriate means of screening out “bad faith but non-frivolous” objections. This is a task for the panelists, addressing the merits.

**INDEPENDENT OBJECTOR**

I. **Key Points**

- The Independent Objector seems like a sensible inclusion in the process.

II. **Summary of Comments**

**Independent objector**

The scope, methods and funding for the independent objector seem sensible. There are likely to be few, if any, cases where the independent objector initiates an objection, but it is important to have this capability in place as a contingency. *eNOM (21 July 2009).*

III. **Analysis and Proposed Position**

ICANN agrees that having the Independent Objector in place is sensible. ICANN introduced the Independent Objector as an element of the dispute resolution process in draft v2 of the Applicant Guidebook, to remedy the situation that might arise where, for one reason or another, no objection is filed against a “highly objectionable” gTLD application. ICANN presented the rationale and briefly described how that person would act in an Explanatory Memorandum published for comment on 18 Feb 2009, entitled “Description of Independent Objector for the New gTLD Dispute Resolution Process.” See http://www.icann.org/en/topics/new-gtlds/independent-objector-18feb09-en.pdf.

Comments on this subject contained several requests for more information and definition concerning this role. The updated text below discusses the Independent Objector in greater detail.

**Mandate and scope**

The IO may file objections against highly objectionable gTLD applications to which no objection has been filed. The IO is limited to filing two types of objections: (1) Morality and Public Order
objections and (2) Community objections. The IO is granted standing to file objections on these enumerated grounds, notwithstanding the regular standing requirements for such objections.

The IO may file a Morality and Public Order objection against an application even if a Community objection has been filed, and vice versa. The IO may file an objection against an application, notwithstanding the fact that a String Confusion objection or a Legal Rights objection was filed. Absent extraordinary circumstances, the IO is not permitted to file an objection to an application where an objection has already been filed on the same ground.

The IO may consider public comment when making an independent assessment whether an objection is warranted. ICANN will submit comments to the IO from the appropriate time period, running through the Initial Evaluation period until close of the deadline for the IO to submit an objection.

The new material also discusses rules for staffing and funding the I/O role.

POST-DELEGATION PROCESSES AND ENFORCEMENT

I. Key Points

• Community-based registry operators should be held to the restrictions they promised to apply to registrations in the gTLD

• Providing for a complaint process and administrative dispute resolution process for community members to utilize when they believe the restrictions are not being followed seems appropriate and efficient.

II. Summary of Comments

Registry restrictions DRP proposal raises questions

Providing a channel for third parties to object to the failure of a community-based registry to enforce certain of its requirements is valuable, but the proposal also raises questions. For example: Why would the procedure be restricted to community-based TLDs (e.g., what about open TLDs with registration or use rules)? Would the availability of the procedure relieve registry operators of the responsibility to enforce the stated restrictions themselves or undermine their incentive to provide customized enforcement mechanisms (e.g., registry-specific procedures to challenge registrant eligibility)? Is it appropriate for ICANN to abdicate any responsibility for enforcing the agreement it has with the registry (which contains the restrictions in question), instead turning the job over to third parties (even if the contract formally denies them any status as “beneficiaries” of the contract)? The RRDRP should not become an incentive or excuse for weak ICANN compliance and audit efforts. How would an RRDRP be integrated with other post-delegation remedies, such as the procedure proposed by the IRT for use with registries that fail to live up to other representations made in the application and/or contained in the registry contract with ICANN? IPC (20 July 2009).

Post-delegation obligations

COA commends ICANN for proposing a process whereby third parties (including but not limited to members of affected communities) could instigate investigations of alleged failures of community-based registries to live up to the commitments they made in the new gTLD evaluation process and that are contained in their registry agreements with ICANN. COA agrees with IPC that the proposal for an RRDRP raises many questions. COA (20 July 2009).
Post delegation dispute resolution mechanism

While it is not explicitly listed in this excerpt of the DAG, GoDaddy opposes the adoption of a new Post Delegation Dispute Resolution Mechanism as described in the IRT final report. The report advances that a mechanism for post-delegation disputes is essential for the protection of trademark holders’ rights. The assertion of this need presumes that the outlined pre-delegation dispute methods, or that ICANN’s ability to enforce its contracts with new gTLD registries, will be unsuccessful. GoDaddy believes that these issues are distinctly separate from the rights of trademark holders. Rather than adopt the IRT’s proposal, GoDaddy urges ICANN to (1) ensure that all stakeholders have confidence in the existing dispute resolution procedures outlined in Module 3, and (2) enforce compliance of all new gTLD registry agreements. GoDaddy (20 July 2009).

III. Analysis and Proposed Position

ICANN appreciates that post-delegation dispute processes need more detail and ICANN is working towards developing that detail.

The need for a Registry Restrictions Dispute Resolution Procedure (RRDRP) is based on the idea that it would not be fair to give a preference in the New gTLD allocation process (which will be provided in the community priority (comparative) evaluation stage) to an applicant based on a promising to restrict use of a TLD to a particular community, and then not require the applicant to keep its promise. Specific requirements must be satisfied in the application for a community-based TLD, and the successful applicant must undertake in the registry agreement to implement the community-based restrictions it has specified in the application. See DAG v.2, 1.2.2.1, 1.2.2.2. Such promises are not required for non-community-based gTLDs. Thus, restricting the application of the RRDRP to only those registry operators that are required to keep promises relating to community as set out in the gTLD application and registry agreements seems appropriate.

The RRDRP is not meant to be the only mechanism by which registry operators will be required to comply with registry agreements. Providing for a complaint process and administrative dispute resolution process for community members to utilize when they believe the restrictions are not being followed, however, seems appropriate and efficient. ICANN will of course continue its other compliance efforts with respect to all registry agreements, including those for new gTLDs.

With respect to a post-delegation dispute resolution mechanism for legal rights, ICANN is in the process of considering and taking consultation on the IRT’s proposal and other proposals from the community. ICANN recognizes that intellectual property owners have various legal options to defend their rights. One option could be an administrative procedure through which violations of intellectual property or other legal rights concerning new gTLDs may be identified and stopped without resort to litigation.

STRING CONTENTION

Community Priority (Comparative Evaluation)

I. Key Points

• The de-aggregation of criteria as published in the excerpts is well received according to the comments. Some comments request further explanations and some also propose refinements and detailed interpretations of the expressions used in the criteria. In the next
version, staff will expand the criteria section with explanatory notes regarding the expressions used, to improve clarity and predictability.

- While some comments welcome the tentative lowering of the scoring threshold to 13 out of 16 points, others claim that this level unduly will facilitate gaming and request a return to the previous threshold, 14 out of 16. Since the addition of the explanatory notes in the next version will clarify scoring and additional testing has occurred, it is intended to set the threshold at the previous mark of 14, although still as a tentative approach awaiting consolidated views and comments on this section as expanded.

- A couple of comments suggest that an even lower threshold should be applied in case there is only one community application in a contention set. This suggestion is interesting but appears at odds with the policy objective of only awarding priority to qualified community applications, while safeguarding against gaming attempts as highlighted by other comments. The next version will accordingly keep the current approach of applying the same scoring standards and threshold regardless of the number of community applications present in a contention set.

- One comment proposes that all IDN applications should be regarded as community applications and be subject to community vetting and approval. While this suggestion would tend to hobble IDNs, it should be noted that the choice to file an application as community-based is up to the applicant and there are no provisions in the application handling process to force a change of an application in this respect. However, in the case an application is seen as violating the rights of a community, the community has the option to file a community-based objection regarding that application. No change in this respect is foreseen for the next version.

II. Summary of Comments

Comparative evaluation criteria

The disaggregation of the scoring criteria is an improvement and makes the overall process easier to understand. IPC also supports lowering the threshold that must be met (13 rather than 14 out of a possible 16 points) in order to survive the “community priority” evaluation and avoid having an auction. This relaxation is particularly needed where only one community-based TLD application is involved. It seems unjustified that ICANN still proposes to treat these cases in the same way as those in which more than one applicant within a contention set claims the backing of a community. IPC (20 July 2009).

Comparative Evaluation – structure concerns

As currently structured, comparative evaluation will too often serve simply as the anteroom to an auction as a means of awarding a TLD string to one of the competing applicants. This gives insufficient weight to the goal of according preference to community-based applications as against “open” proposals. COA commends ICANN for the changes made to lower the threshold that must be met (13 rather than 14 out of a possible 16 points) in order to survive the “community priority” evaluation and avoid having an auction. But it apparently remains the case that any community application which has been the subject of a community objection by an objector with standing automatically loses 2 points even though by definition it has vanquished the objection. Once that occurs there are many pitfalls which could cause the application to lose two more points and slip below the threshold required. The high threshold for surviving comparative evaluation seems particularly unjustifiable in the circumstance in which there is only one community-based application for a particular string. ICANN has never explained why
the evaluation process must be equally rigorous in such a case, as it would be when two community-based applications are contending for a single string. While a further relaxation of the 13-point threshold ought to be considered across the board, it seems essential in this situation. COA (20 July 2009).

**Comparative evaluation — clarification of specific criteria is needed**

For example, there are likely to be situations which fall between the only two criterion 3A provides. Criterion 2B also needs clarification; relatively few character strings (in Latin characters at least) that identify communities would not also be identical to words with completely different meanings in some language. If that counts as “other significant meaning” criterion 2B would rarely be satisfied. COA (20 July 2009).

**Comparative evaluation**

GoDaddy generally supports the methods of evaluation described in Module 4, but has some concerns about lowering the threshold score. ICANN must ensure that only true community-based applications are granted priority, and that the system is not abused or gamed. ICANN should publish the results of the ICANN staff’s scenarios to test this scoring method for public review. GoDaddy (20 July 2009).

**Comparative evaluation criteria**

By nature IDN is a “community-based” TLD because IDN is a localized service to serve Internet users using certain language. It is recommended that an IDN application consult the related community to avoid complications from future objections. If a language or script is shared among different nations and regions, a coordinating mechanism should be structured among these stakeholders. The opinion of the supermajority of the specific language user should be respected. Also, CNNIC recommends that ICANN fully consider the opinion of the Chinese Domain Name Consortium (CDNC) when evaluating Chinese TLD applications. The users served by members of CDNC account for over 99% of Chinese Internet users worldwide and this consortium is a legitimate representation of the Chinese domain name community. CNNIC (21 July 2009).

**Community priority criteria**

The complex principle of community should give preference to applicants whose selected string so closely reflects the applicant group’s identity that to allow another applicant to have that string would impinge on the rights of the group. “Rights” should mean that the string is the name of the group, and has no other meanings, so in effect it “belongs” to them. Community is proper for applicants who do not have legal (e.g., trademark) rights in the string but nevertheless should not have to compete with other possible applicants for the string. eNOM (21 July 2009).

**Community and generic strings**

Community should not be abused by applicants seeking to obtain and limit a generic string that has many uses. Such general strings should be allowed to be shared by the wider Internet community. When a legitimate community string is communicated (by itself and without other words) there should be no doubt which group of individuals or organizations the string refers to, and by definition there should be very limited or no other uses of the string outside a description of that group. eNOM (21 July 2009).
Proposal to deter “gaming” of community bids

Because community bids beat open bids, there is a huge incentive for applicants to claim community and this may encourage gaming of the process, leading to disputes and potential litigation. To support legitimate community bids and reduce such gaming abuses, Section 4.2.3 should be clarified as follows:

- **Criterion 1—community establishment**—there should be clear definitions of the terms “organized”, “size”, and “longevity”. “Organized” should require documented evidence of community objectives, processes, operations and activities that were not associated purely with the pursuit of the TLD. “Size” should require tens of thousands of community members (at a minimum) and “longevity” should require that the community have been “organized” for at least two years prior to the TLD bid. In all cases the tests should be applied to the **actual community cited in the application** and not to individual members who have coalesced to form the community.

- **Criterion 4—community endorsement**—a score of 1 for support currently states:
  “Documented support from at least one group with relevance, but insufficient support for a score of 2.” eNOM interprets this to mean that if the string is potentially relevant to more than one possible group the evaluator will apply a score of 1 (unless all possible groups have joined to form the applying community). This interpretation is logical because to define it otherwise would guarantee a support score of 2 to any applicant. It would be useful to applicants to have a note explaining that “if the string is potentially relevant to more than one possible group the evaluator will apply a score of 1 (unless all possible groups have coalesced to form the applying community).”

- **String nexus**— this is the most important criterion and eNOM applauds the new language that brings nexus scoring more into line with a community’s “name” and “identity” as opposed to just “association” or “relevance” (as it appeared in prior drafts). An “I am a ____” test is a good indicator whether an applicant should score a 2 or more on nexus. Under this test the applicant or a member of the applicant’s community should be able to complete that sentence where the TLD string fills in the blank. If the subsequent sentence makes grammatical and logical sense we think a nexus score of 2 or more is possible. If the sentence does not make grammatical or logical sense a score of 2 or more would not be achieved.

- **Uniqueness**—eNOM supports the new uniqueness score but believes that uniqueness is so important that applicants who meet this test should get 2 points instead of the proposed 1 (i.e., there would be a 2 or 0 score for uniqueness). Such scoring would be consistent with the February 2009 Analysis of Public Comment that concluded: “There is merit in considering uniqueness in the nexus between string and community as a main factor for achieving a high score. To be an unambiguous identifier, the ‘ideal’ string would have no other associations than to the community in question “(emphasis added).

- **Maximum number of points**—Increasing the uniqueness component to 2 points would make a total of 5 possible points for nexus, which is appropriate given the importance of this criterion. The maximum overall points would then become 17 instead of the current 16. In conjunction with this, eNOM strongly recommends that the current 13 points to pass the threshold be returned to its previous level of 14 except that whereas previously a score of 14 out of 16 was required for community now there would be a 14 out of 17 pass threshold. Even if the total number of points is not increased from 16 to 17, eNOM strongly recommends that the point total to achieve community be changed back to 14 (as it was in
the prior DAG) so as to align community with its true objective: “to prevent the misappropriation of a string that uniquely or nearly uniquely identifies a well established and closely connected group of people or organizations.” eNOM (21 July 2009).

Nexus criteria
The criteria to score 2 points are the same as to score 3 points when using “to cause to be identical to” as the definition of the word “identify.” The guidebook needs to be crisp where it can be, which assists the goal of being objective rather than subjective. Crucial words should be used in the context of their intended meaning and definition. The intention cannot be for the criteria to be the same for 3 points and 2 points. The simple remedy is to change “The string identifies the community” to “The string identifies WITH the community”. This change allows people to interpret the proper meaning and definition in the context of the criteria and understand the difference of how to score 3 points versus 2 points for Nexus. R. Fassett (10 June 2009)

III. Analysis and Proposed Position
The de-aggregation of criteria as published in the DAG excerpt is well received according to the comments. Some comments request further explanations of the criteria and some also propose refinements and detailed interpretations of the expressions used in the criteria. ICANN staff is grateful for these suggestions and will expand the next version of the criteria section with explanatory notes regarding the expressions used, to improve clarity and predictability.

A broad spectrum of suggestions was made to make amendments to the scoring mechanism. Some comments welcome the tentative lowering of the scoring threshold to 13 out of 16 points as essential to avoid an outcome whereby many contention sets end up in an auction. Others, however, claim that this level unduly will facilitate gaming by applicants that may construe “communities” for the purpose of getting an upper hand in a contention set. They accordingly request a return to the previous threshold, 14 out of 16. One comment proposes an alternative; raising the maximum score for “uniqueness” to 2 while setting the winning threshold at 14 out of 17. The addition of the explanatory notes in the next version is intended to provide additional clarity for applicants in determining whether the TLD they proposed is a community-based TLD in accordance with the definition in the Guidebook and the intent of the policy recommendation. The new definitions and empirical testing of the standards indicate that the score of 14 should be restored as a threshold for the next version. The threshold will remain as a tentative approach, awaiting consolidated views and comments on this section when it has been expanded with the explanatory notes.

A couple of comments suggest that an even lower threshold should be applied in case there is only one community application in a contention set. This suggestion is interesting but seemingly at odds with the objective of only awarding priority to qualified community applications above open applications, while safeguarding against gaming attempts as highlighted by other comments. The next version will accordingly keep the current approach of applying the same scoring standards and threshold regardless of the number of community applications present in a contention set.

One comment contends that a community objection by an objector with standing, even if not upheld by the DRSP, would automatically make the application lose 2 points in criterion 4B, "Opposition". On balance, however, this objection too seems to go against the thrust of the policy intent; it is less likely that the objection alone (especially when defeated) would be seen as proof of "strong and relevant" opposition, leading to a score of 0. The score of 1 for "relevant
opposition from at least one group of non-negligible size” is a plausible alternative outcome, but this too depends on the circumstances and cases must be considered individually – with no automatic determinations based upon previous processes such as the objection procedure.

A comment suggests that the tests undertaken by staff be published. It should be noted that the tests were made in an iterative way with the objective of achieving the current de-aggregation of criteria, by using successive criteria drafts together with batches of hypothetical examples (including hypothetical opposition cases) where a staff group scored the examples individually, compared notes and redrafted criteria when scoring and understanding of the criteria diverged. This “work-in-progress” succession of drafts, examples and scores is prone to misunderstanding and the examples could easily be both misinterpreted and misrepresented as well. Rather than publishing this complex set, staff believes that the publishing of the explanatory notes in the next version is a more constructive way of advancing the dialogue on Community Priority.

One comment appears to propose that all IDN applications should be regarded as community applications and be subject to a kind of community vetting and approval. It should be noted that the choice to file an application as community-based is wholly up to the applicant and that there are no provisions in the application handling process to force a change of an application in this respect. However, in the case an application is seen as violating the rights of a community, the community has the option to file a community-based objection to that application. Additionally, IDN applications should not be restricted as to business model. There are as many commercial uses for IDN TLDs as for ASCII/Latin TLDs and IDN applicants should not be restricted to a limited set of uses for their TLD. It is believed that the current community-based provision satisfies the underlying requirement in the comment for protecting a community’s interest and no change is foreseen for the next version in this respect.

**AUCTIONS**

**I. Key Points**

- One comment noted there is still concern about the use of auctions to resolve contention among competing gTLD applications, including the form of organization to receive proceeds and use of funds.

- One comment suggested that ICANN lengthen the time for bidders to provide final payment to ICANN following an auction from ten days to thirty days, due to restrictions on foreign currency and money transfer.

**II. Summary of Comments**

Two comments related to auctions were received during the comment period on the revised excerpts: the use of auctions as a meta-question and the timing of auction payments.

**Auctions**

IPC reiterates its strong concerns about using auctions to award new gTLDs.

These concerns include the uses of proceeds and the effectiveness of auctions as choosing the most deserving or most appropriate applicant (to paraphrase the IPC report. The comments can be separated into two arguments: whether auctions are the most appropriate form of contention resolution and, if it is, “there is a unspoken issue hovering over the auctions ... what ICANN will do with the proceeds of any auctions it holds to allocate new TLDs”? *IPC (20 July 2009).*
Auctions—timing of payment after winning bid

While it is expected that money should be prepared when entering into the bidding process, it still poses a challenge for some winning bidders to make the money to ICANN timely in the short timeframe of ten business days at the end of the auction. Quite a few countries impose restrictions on foreign currency and the money transfer will take a long process before it reaches ICANN’s account. Given the complexity of the international financial systems, CNNIC advises that ICANN extend the timeframe from 10 days to 30 days. CNNIC (21 July 2009).

III. Analysis and Proposed Position

The Intellectual Property Constituency (IPC) reiterated its previous comments about the use of auctions in the new gTLD process. ICANN sought to address these comments in its Explanatory Memo on Resolving String Contention published on 22 October 2008 (see http://www.icann.org/en/topics/new-gtlds/string-contention-22oct08-en.pdf). The current comment section makes similar arguments stating that the initial arguments were not addressed in the memorandum or subsequent analyses. These concerns include the uses of proceeds and the effectiveness of auctions as choosing the most deserving or most appropriate applicant (to paraphrase the IPC report): whether auctions are the most appropriate form of contention resolution and, if it is, “there is an unspoken issue hovering over the auctions ... what ICANN will do with the proceeds of any auctions it holds to allocate new TLDs”?

The validity of the IPC comments on this topic is recognized. The ability to pay more in an auction isn’t the indicator of eventual benefits to registrants. The GNSO indicated that community representations should be a factor in determining contention cases. In response, a process has been developed to identify bona-fide community applicants and provide them with a preference in every case of contention. Other factors to give a preference have been discussed: language groups, city groups, not-for-profit organizations, applicants from least developed countries to name a few. Attempting to create a methodology for an effective sort of beauty contest is very difficult. The brightest line distinction is perhaps the community designation requested by the GNSO and that implementation has proven to be extraordinarily difficult. Other factors are susceptible to gaming and will result in vague evaluation criteria.

ICANN has taken the position that auctions are the contention resolution method of last resort – and it is thought that auctions will occur rarely. The community priority (comparative) evaluation process can be used by community-based applicants to avoid auctions with large commercial entities. The community priority evaluation criteria are written purposefully in a way that will admit and empower small community-based applicants. The score for succeeding in the community priority evaluation is high to avoid contention between large commercial entities and community applicants.

After community priority evaluation, if there is still contention, parties are encouraged to settle. This is the opposite of spectrum auctions where parties are commanded to stay apart. ICANN encourages settlement as the most economical and effective method to delegate the TLD. Agreements can be made that better meet the needs of all contending parties and potential registrants. With the economic incentive to settle, it is thought that auctions will not occur frequently.

With regard to the use of funds, ICANN has done considerable work that will be published for public comment. For example, it has been determined that ICANN’s receipt of string-contention auction proceeds must not jeopardize its public charity status under IRC § 509(a)(2), and that it might consider establishing or making arrangements with separate nonprofit entity to receive...
auction proceeds where ICANN’s role is limited to designating conditions and restrictions necessary to ensure the funds are used for the public benefit. Potential uses of funds include: improving Internet infrastructure, capacity building in developing areas, lowering costs for applicants from developing areas, creating grants for benefit of Internet community, lowering registration fees, supporting ccTLDs of developing countries, creating a security fund, fund “insubstantial” lobbying activities in favor of global public interest, or generally promote the global public interest in DNS stability.

It is suggested that ICANN extend the period of time for winning bidders to provide payment from ten days to thirty days, as some countries impose restrictions on foreign currency transfers. ICANN will consider this suggestion as further detail is provided on the auction process for the next version of the Applicant Guidebook.

ICANN believes that, in most instances, requiring payment from winning bidders within 10 business days of the auction will not impose an undue hardship on applicants and that it will produce a fairer auction process than a longer payment period. In entering an auction, a participant is on notice that it might be obligated to disburse funds in the near future. The effective notice period then, is much longer than 10 days. The 10-day requirement in the current Guidebook is based on study of other international auction models. However, in the event that a given applicant anticipates that it would require a longer payment period due to documentable government-imposed currency restrictions, the applicant may advise ICANN well in advance of the auction and ICANN will consider applying a longer payment period to all applicants in the auction(s) in which the given applicant is participating.

REGISTRY AGREEMENT

I. Key Points

- Thick Whois requirement will ensure reliable access to data on registrations in new gTLDs.
- Specially-tailored Whois models will continue to be available through ICANN’s "Procedure for Handling Whois Conflicts with Privacy Law."
- ICANN will investigate providing incentives for new registries that take steps to promote Whois accuracy.

II. Summary of Comments

IPC commends ICANN for requiring thick Whois registries in response to concerns of the IRT and others

This requirement will among other things greatly help in tracking down intellectual property infringement and other abuses. It is consistent with the practice of the vast majority of existing gTLD registries. Any privacy concerns are adequately addressed by existing procedures. ICANN should also take this opportunity to provide incentives for new registries to take on some of the responsibility for ensuring that the ICANN-accredited registrars which they employ to sponsor registrations live up to their obligations regarding Whois. IPC (20 July 2009). COA strongly supports IPC’s comments, especially support of the thick Whois requirement from all new gTLDs. To COA’s knowledge, ICANN has never responded to the proposal for provisions in the draft registry agreement to oblige registries to take steps to ensure compliance with Whois-related obligations by ICANN-accredited registrars within the new TLD. There is precedent for such provisions in the .asia registry agreement. COA (20 July 2009).
Thick Whois—support
INTA IC strongly supports the proposal to require all new TLD registries to implement a “thick” Whois model, and commends ICANN for adopting this recommendation in the latest proposed DAG amendments. Simplifying access to accurate and reliable contact details for the true owner of the domain name registration is necessary to prevent abuses of intellectual property and to protect the public by preventing consumer confusion and consumer fraud in the Internet marketplace. INTA supports open access to accurate ownership information for every domain name in every top-level domain registry, for addressing legal and other issues related to the registration and use of the domain name. INTA IC (20 July 2009).

Telnic Model Adoption—support
It would be a giant step forward to adopt the Telnic model for all new gTLDs regardless of which jurisdiction they are under. This would allow addressing legitimate concerns of both the individuals seeking more privacy and those of LEA and others that need to access the full data. P. Vande Walle (29 June 2009). See also S. Mosenkis (19 July 2009).

Harmonize Whois for registries and registrars
It should also be logical to adapt the RAA to harmonize the Whois requirements for registrars to match those of registries. It would make little sense to protect the privacy of individuals at the registry level if full data is displayed by the registrar Whois anyway. We need to be consistent. P. Vande Walle (29 June 2009).

Significance of thick Whois requirement for new TLDs
The IRT report stated that provision of Whois information at the registry level under the thick Whois model is essential to cost-effective protection of consumers and intellectual property owners. eNOM notes that the “com” and “net” registries, which hold 84% of all gTLD registrations, are not thick, so that the logical conclusion of the IRT report is that cost-effective trademark protection is not possible in “com” and “net”. eNOM further notes that given the new DAG version’s mandatory Thick Whois requirement for new TLDs, this must be seen as a major victory for the IRT and a significant reduction in trademark protection costs versus “com” and “net”. eNOM (21 July 2009).

III. Analysis and Proposed Position
The comments on this subject generally supported the proposed changes to the registry agreement’s Specification #4 on "Registration Data Publication Services." ICANN will adopt and maintain these changes in the next version of the Applicant Guidebook. The rationale for the changes was described in an explanatory memorandum titled "Thick vs. Thin Whois for New gTLDs" <http://icann.org/en/topics/new-gtlds/thick-thin-whois-30may09-en.pdf>. As described in the explanatory memorandum, not only would thick Whois ensure reliable access to data on registrations in New gTLDs, but there would also be stability benefits that could accrue to registrants.

One commenter urged the adoption of a tiered access model (from dot-tel) across all new registries and also the modification of the Whois obligations in ICANN’s registrar agreements. Another commenter recommended the adoption of features present in two existing gTLD agreements (dot-asia and dot-mobi) that indicate a role for registry enforcement of registrar Whois accuracy obligations. While such recommendations might have merit, mandating them across all new registries would not be consistent with ICANN’s goals for the New gTLD program as described in the explanatory memorandum: "Whois is the subject of continuing work within
ICANN's policy development process. In launching new gTLDs, ICANN's goal has been to maintain the status quo so as not to pre-empt or side-step the bottom-up policy development work." Such proposals could be appropriately addressed within the GNSO's continuing work on Whois and RAA changes.

Heather Dryden
Chair of the Governmental Advisory Committee
Senior Advisor to the Government of Canada

Dear Heather

GAC Comments on new gTLDs and Draft Applicant Guidebook version 3

Thank you for the GAC’s letter of 10 March 2010, providing comments on new gTLDs and version 3 of the Draft Applicant Guidebook. I believe the Board and GAC share a similar viewpoint that it would be in the global public interest that “… the opening up of the gTLD space is undertaken in a way that does not compromise the resilience and integrity of the DNS and serves the global public interest”. The Board is pleased with the way in which the various iterations of the guidebooks are evolving, and is particularly pleased by the mechanism whereby the overarching issues are being resolved through working groups comprised of members of the ICANN community and independent experts.

I respond below to each of the areas of concern raised by the GAC.

Root scaling implications

ICANN supports the principle that the scale and rate of changes must not negatively impact the resilience, security and stability of the DNS. In February 2009, the ICANN Board requested the Root Server System Advisory Committee (RSSAC), the Security and Stability Advisory Committee (SSAC), and the ICANN staff (including ICANN Staff members dealing with technical issues and the IANA functions) to study the potential issues regarding the addition of IDNs, IPv6 addresses, DNSSEC and substantial numbers of new TLDs to the root zone. This study was completed in August 2009 and posted for comment at

In addition, and as part of ongoing efforts to ensure the stability of the DNS, ICANN contracted with the DNS Operations, Analysis and Research Center (https://www.dns-oarc.net/) as independent and well-respected experts to provide an analysis of the impact of adding IPv6, DNSSEC, and additional top-level domains to the ICANN-operated L root server. This study, while independent of the Root Server System
Root Scaling study and focused specifically on the impact to the ICANN-operated L root server, has been used as input in the more comprehensive study undertaken by the Root Scaling Study Group. The final report of the DNS-OARC study was published at http://www.icann.org/en/topics/ssr/root-zone-augmentation-analysis-17sep09-en.pdf.

Regarding the number of strings in an application round, this was considered in the analysis and model for anticipated new gTLD delegation rates published by staff, and is available at http://www.icann.org/en/announcements/announcement-03mar10-en.htm. This analysis indicates that processing constraints will limit delegation rates to a steady state even in the event of extremely large numbers of applications, so that even in a scenario where there are very many applications for new gTLDs, the rate of growth of the root zone would remain linear.

The SSAC and RSSAC are considering the data and analysis in each of these reports and are expected to prepare recommendations for the Board on concrete steps (such as any limitations or emergency removal procedures) to be implemented prior to the initial gTLD application round.

**Malicious conduct and abuse of the DNS**

Some have made the case that the introduction of new gTLDs will result in an increase in malicious conduct. While this has not been quantitatively demonstrated, significant steps have been taken to ensure that malicious conduct is mitigated in the new environment of new gTLDs through the introduction of several protections.

These protections, described below, were the result of a study undertaken of malicious conduct as it related to the new gTLD space. During the study, ICANN staff solicited and received comments from multiple outside sources, including Intellectual Property Constituency (IPC), Registry Internet Safety Group (RISG), the Security and Stability Advisory Committee (SSAC), Computer Emergency Response Teams (CERTs) and members of the banking/financial, and Internet security communities. As a result of this work, nine measures were recommended to increase the benefits to overall security and stability for registrants and trust by all users of these new gTLD zones, and each of these requirements will be implemented in the program:

- Vetted registry operators (background checks)
- Demonstrated plan for DNSSEC deployment
- Prohibition of DNS redirection or “wildcarding”
- Removal of orphan glue records to eliminate a tool of spammers and others
- Maintenance of thick WHOIS records
- Centralized method of zone-file access
- Documented registry abuse contacts and procedures
• Participation in an expedited registry security request process.

These are the recommendations of the experts in this area when asked the same question that was posed by the GAC. More detailed information about these recommendations is available in the Mitigating Malicious Conduct explanatory memorandum, available at: http://www.icann.org/en/topics/new-gtlds/mitigating-malicious-conduct-memo-update-28may10-en.pdf.

Intellectual Property Rights

The GAC comments, in concert with other comments, were taken in account in version 4 of the Applicant Guidebook that, for the first time, included the set of proposed intellectual property rights protection mechanisms. In particular, ICANN has broadened the types of trademark registrations that must be honored in offering a “Sunrise” service and all new registries employing an IP Claims service must honor trademarks registered in all jurisdictions. The types of registrations offered protections have also been broadened for the Uniform Rapid Suspension Service, one of the new post-delegation rights protection mechanisms. The Post Delegation Dispute Resolution Policy has also been amended in response to specific recommendations from the ICANN community. Rather than recount all the changes here, please see the redlined proposals for:

Economic studies

The report examines the current status of the gTLD market and surveys existing work that has been done on this set of economic issues. The report also outlines a number of potential case studies that would seek to quantify the net costs and benefits involved in the introduction of new gTLDs. Selected studies recommended in the report are now
being initiated. It is possible that these second-phase studies will recommend particular measures for the gTLD evaluation process that would minimize external costs (including, for example, the cost of defensive registrations) while allowing socially beneficial innovation. In this case, any such recommendations will be considered by ICANN and subject to public consultation before being implemented.

ICANN has published additional economic studies:

- Report Of Dennis Carlton Regarding ICANN’s Proposed Mechanism for Introducing New gTLDs
  (http://www.icann.org/en/topics/new-gtlds/carlton-re-proposed-mechanism-05jun09-en.pdf)

- Preliminary Report of Dennis Carlton Regarding Impact of New gTLDs on Consumer Welfare

- Preliminary Analysis of Dennis Carlton Regarding Price Caps for New gTLD Internet Registries

- Report from CRA International “Revisiting Vertical Separation of Registries and Registrars”

In addition, the GNSO considered whether new gTLDs should be introduced and the net benefits of new gTLDs in its final report on the introduction of new gTLDs (http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm).

Country and territory names prohibited in version 4 of the Draft Applicant Guidebook

As you are aware, the treatment of country and territory names in the DAG4 Guidebook was developed specifically to adhere to paragraph 2.2 of the GAC principles on new gTLDs, i.e., the GAC view that governments should not be denied the opportunity to apply for, or support an application for, their respective country or territory name. However, the GAC’s clarification of their interpretation of GAC principle 2.2 has resulted

---

1 “The GAC interprets para 2.2 of the GAC gTLD principles that the strings that are meaningful representation or abbreviation of a country or territory name should be handled through the forthcoming ccTLD PDP, and other
in a reconsideration of the treatment of country and territory names in the new gTLD process. This has resulted in a change of approach as reflected in the recently published draft version 4 of the Applicant Guidebook: namely, that country and territory names will not be available for delegation in the first round of the new gTLD application process.

With regard to the definition of country names, the Board has sought to ensure both clarity for applicants, and appropriate safeguards for governments and the broad community. A considerable amount of time has been invested in working through the treatment of country and territory names to ensure it meets these two objectives. Following discussion at the Mexico City meeting, the Board recommended that the Applicant Guidebook be revised in two areas regarding this subject: (1) provide greater specificity as to what should be regarded as a representation of a country or territory name in the generic space, and (2) provide greater specificity in defining the qualifying support requirements for continent names, with a revised position to be posted for public comment.

The resulting definition for country and territory names is based on ISO 3166-1 and other published lists to provide clarity for potential applicants and the community. It seeks to remove the ambiguity created by use of the term ‘meaningful representation.’ Therefore, the definition of country and territory names has not been amended in the recent Guidebook draft and remains consistent with the Board goals and resolution on this issue.

While the revised criteria may have resulted in some changes to what names are afforded protection, there is no change to the original intent to protect all names listed in ISO 3166-1 or a short or long form of those names (and, importantly, translations of them). This level of increased clarity is important to provide process certainty for potential TLD applicants, governments and ccTLD operators – so that it is known which names are provided protections.

The definition is objectively based on the ISO list, which is developed and maintained by a recognised international organisation.

It is acknowledged that ICANN has used the concept of ‘meaningful representation’ of a country or territory in the context of the IDN ccTLD Fast Track. This reflects the objective of rapid initial deployment of IDNs and the associated need to remove as many potential obstacles as possible. There have always been particular sensitivities about geographic names where non-Latin scripts and a range of languages are involved. It does not follow that these considerations should automatically apply to the broader ccTLD and gTLD spaces. It is reasonable that the criteria for including names (the Fast Track) could be different than the criteria for excluding names (gTLDs).

geographical strings could be allowed in the gTLD space if in agreement with the relevant government or public authority.”
The ccNSO will be undertaking policy discussions, which may result in a change in position on these two issues. In particular, defining the distinction between country code and generic names may warrant a broader cross-SO/AC policy discussion. Once policy is developed, it will be appropriate for the Board to reconsider these positions.

Definition of geographical strings insufficient and not in line with paragraphs 2.2 and 2.7 of the GAC principles regarding new gTLDs

As mentioned above, the Board has sought to ensure, throughout the process of developing a framework for new gTLDs, that there is 1) clarity for applicants, and 2) appropriate safeguards for the benefit of the broad community. The current criteria for defining geographic names as reflected in version 4 of the Draft Applicant Guidebook are considered to meet the Board’s objectives and are also considered to address to the extent possible the GAC principles. The current definitions, combined with the secondary avenue of recourse available by way of objections are considered adequate to address the GAC’s concerns.

It should be noted that much of the treatment of geographic names in the Applicant Guidebook was developed around the GAC Principles regarding new gTLDs, and conversations and correspondence with the GAC on this issue going back to 2008.

On 2 October 2008, (http://www.icann.org/correspondence/twomey-to-karklins-02oct08.pdf) following a teleconference with the GAC on 8 September 2008, the then CEO & President, Paul Twomey, wrote to the GAC explaining proposed principles to guide a procedure for implementing elements of paragraph 2.2. Place names were split into two categories, as follows: 1) sub-national geographical identifiers such as countries, states, provinces; and, 2) city names. Regional language or people descriptions were considered difficult to develop an implementation plan for this element of paragraph 2.2, because it will be difficult to determine the relevant government or public authority for a string which represents a language or people description as there are generally no recognised established rights for such descriptions.

As described in the 2008 letter, city names were considered challenging because a city name can also be a generic term, or a brand name, and in many cases city names are not unique. Therefore, where it is clear that an applicant intends to use the gTLD for purposes associated with the city name evidence of support, or non-objection is necessary. However, provision is made in the Guidebook to protect sovereign rights by requiring government approval for capital city names in any language, of any country or territory listed in the ISO 3166-1 standard.
During the teleconference of 8 September 2008, GAC members identified the ISO 3166-2 List, as an option for defining sub-national names. Accordingly, version 4 of the Applicant Guidebook provides protection for all the thousands of names on that list. Also during this call the idea of the GAC creating a list of geographic and geopolitical names was discussed, however, it is understood that the GAC moved away from this suggestion because it would be a resource intensive effort for all governments to undertake.

In relation to paragraph 2.7, at the Board’s request, Paul Twomey (who was ICANN’s CEO and President), wrote to the GAC on 17 March 2009 (http://www.icann.org/correspondence/twomey-to-karklins-17mar09-en.pdf), requesting the GAC’s input on possible options to resolve the outstanding implementation issues regarding the protection of geographic names at the second level. The end result of this request was a letter from the GAC to Paul Twomey, dated 26 May 2009 (http://www.icann.org/correspondence/karklins-to-twomey-29may09-en.pdf), which proposed a solution, that was accepted by the Board and ultimately reflected in the draft Registry Agreement developed for new gTLDs. On this basis, the Board considers that this matter has been dealt with to the satisfaction of the Board and the GAC.

Mechanisms for dealing with post-delegation deviation from conditions of government approval

The GAC’s suggestion of including a clause in the registry agreement requiring that in the case of a dispute between a relevant Government and the registry operator, ICANN must comply with a legally binding decision in the relevant jurisdiction has been adopted. The Registry Agreement has been amended accordingly.

In addition, the processes and remedies of the Registry Restrictions Dispute Resolution Procedure are available to governments in cases where the geographic name is applied for as a community-based TLD. The remedies that can be recommended to ICANN under this procedure include:

- remedial measures for the registry to employ to ensure against allowing future registrations that do not comply with community-based restrictions;
- suspension of accepting new domain name registrations in the gTLD until such time as violation(s) is cured; or, in extraordinary circumstances;
- providing for the termination of a registry agreement.
Other protections have been added to ensure ongoing government approval of the delegation. Further information is available in explanatory memoranda. The following “Withdrawal of Government Support – Post delegation procedures” (http://www.icann.org/en/topics/new-gtlds/withdrawal-government-support-28may10-en.pdf) and “Registry Transition Procedures” (http://www.icann.org/en/topics/new-gtlds/registry-transition-processes-28may10-en.pdf) were posted on 31 May 2010.

Objection mechanisms should be improved

I reiterate my response of 22 September 2009, to the GAC on this issue:

“It is difficult to predict with accuracy whether the costs of the objection procedure will prove to be a barrier to legitimate objections; however, it is felt that the existence of a fee to lodge an objection is necessary as a deterrent to frivolous objections. Interested parties may pool their resources to finance an objection that they consider to be legitimate and important. The rule that the prevailing party will be fully reimbursed for the filing fee and advance payment of costs that it paid (Article 14(e)) is intended to lessen the financial burden upon parties that file a well-founded objection. Finally, it should be recalled that the Independent Objector may also file an objection where, for various reasons (including cost), no other objection had been filed.”

“Governments that are members of the GAC have a mechanism to provide advice to ICANN’s Board, in accordance with ICANN’s Bylaws; however, it is not clear that Bylaw was intended to provide an avenue for governments to provide advice on operational matters of this nature. The ICANN Board wishes to have a neutral, expert determination, based upon certain published standards, when deciding whether to accept an application for a new gTLD or if an objection should be upheld.”

Reviewing that response and the issues posed in your letter, I would add the following. ICANN (and the community) devoted substantial resources to develop the policy and implementation models to protect important interests through an objection based dispute resolution benefit. Still, specific suggestions for improvements are encouraged and I understand some Supporting Organizations and Advisory Committees are forming groups to study the issue. ICANN staff will support that work. The costs of that process are paid directly to the dispute resolution provider – no fees are added as a deterrent to potential objectors. In fact, one intended result of the process is to discourage applicants of controversial names that may infringe upon those important interests.

We note that governments pay fees for other services, enter into agreements, and pursue conflict resolution. We do not believe that governments should be afforded special consideration by exempting them from paying fees associated with filing an objection. To do so would result in an inflation of costs for other objectors to cover the costs incurred by government requests. This is different, however, from arrangements to assist impecunious governments. If the GAC is able to provide the principle on which
they base their request for exemption, it will be considered for inclusion into the procedure.

Resolution of competing string applications does not give rise to auction-derived surpluses, but is decided on the respective value of the applications for end users.

The purpose of an auction is to resolve contention in a clear, objective manner as the avenue of last resort in resolving contending applications.

Possible uses of funds from this source include formation of a foundation with a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community, such as grants to support new gTLD applications or registry operators from communities in subsequent gTLD rounds, the creation of an ICANN-administered/community-based fund for specific projects for the benefit of the Internet community, the creation of a registry continuity fund for the protection of registrants (ensuring that funds would be in place to support the operation of a gTLD registry until a successor could be found), or establishment of a security fund to expand use of secure protocols, conduct research, and support standards development organizations in accordance with ICANN’s security and stability mission. That is, funds will be used in a manner that supports directly ICANN’s Mission and Core Values and also maintains its not for profit status.

Potential benefits of categories (or track differentiation) should be fully explored.

ICANN is a strong proponent of innovative uses of new TLDs. This is especially so in cases where TLDs can be delegated to address the needs of specific communities such as intergovernmental organizations, socio-cultural groups and registered brands. Rather than having ICANN limit this type of innovation and identification with certain TLD models, more creativity might be spawned by allowing different groups to self-identify the type of TLD they purport to be and promote that model among their community. If a self-declaration program is instituted and contractual accommodations are eliminated or minimized, fees can remain constant. Socio-economic groups, brand owners and other groups all can be accommodated under the existing structure and self-identify as a particular type of TLD. Over time, the market and community interests will sort TLD types – a model preferable to having ICANN make that determination a priori. To reiterate, it is not for ICANN to develop these distinctions a priori.

It may well be that as definitive categories of applicants emerge in practice, and as ICANN and the respective communities gain further experience of possible benefits of additional gTLD categorization over time, organizational structures might be developed with ICANN to reflect these categories. That will be a consequence of bottom-up policy developments by affected participants, according to the ICANN model. Nothing in the current implementation procedures forecloses those future developments.
Significant consideration has been given to the issue of the introducing category-based TLDs in the new gTLD process. The policy recommendations of the GNSO and the GAC principles have resulted in the creation of three gTLD categories or types:

- Community-based TLDs
- Geographic Name TLDs
- Everything else (called standard or open TLDs)

Community comment suggests the creation of several TLD categories: for example, single-owner, country, intergovernmental organization, socio-cultural, community and open. Depending on the category, various accommodations are suggested: for example, no requirements for an ICANN contract, or to use accredited registrars, or to follow consensus policy, or policy provisions outlined in the GAC’s ccTLD principles. Some might be restricted to not-for-profit status, be eligible for reduced fees, require registration restrictions, and have names reserved in anticipation of registration by certain parties.

Beyond the accommodations sought, many or all of the suggested categories seem to be variations of community-based TLDs. The preference for community-based TLDs in the evaluation/contention process is based on policy advice from the GNSO and is intended to ensure that community-based applicants receive the TLD string to which their community is strongly related. Perhaps the most important aspect of the suggested categories is that an applicant within these categories does, in fact, receive the string associated with its community, and that is what the existing process is designed to do.

The introduction of a number of new gTLD categories with a number of different accommodations will lead to a complex and difficult application, administration and evaluation process, in addition to a very complicated contractual compliance environment. Additionally, there will be considerable debate and discussion in the community as to whether certain accommodations should be made. Should certain gTLDs not be required to have an agreement with ICANN or not be required to follow consensus policy? Should certain TLDs be required to maintain not-for-process status?

These discussions and debates will take considerable time and resources and may ultimately not result in consensus.

The structure of TLD categories, if granted different accommodations with differing contractual obligations, would result in significantly higher compliance costs and therefore, annual fees.

I thank the GAC for their continued effort in considering the implementation of the new gTLD program.

As the Board’s resolution (http://www.icann.org/en/minutes/resolutions-25jun10-en.htm#11) from the Brussels meeting sets out, there will be a Board Workshop focusing on new gTLDs on 24 and 25 September 2010. The Board will use this time to consider all of the outstanding issues
relating to the implementation of the new gTLD program. We will likely follow the Board Workshop with a Special Board Meeting focusing on the new gTLD topics.

I understand the GAC is preparing their comments on version 4 of the Draft Applicant Guidebook, and we very much look forward to the GAC’s input for use in that Board Workshop.

Yours sincerely

GAC Comments on version 4 of the new gTLD Applicant Guidebook

Dear Heather

Thank you for your letter of 23 September 2010, providing GAC comments on version 4 of the Draft Applicant Guidebook. I also thank you for your letter of 4 August 2010, relating to procedures for addressing culturally objectionable and/or sensitive strings. I will respond to both letters in this communication.

As you know the Board met in Trondheim on 24 and 25 September 2010, and discussed outstanding issues relating to the implementation of the New gTLD program in order to identify potential ways forward. To the extent possible, the Board took into account the GAC’s comments of 23 September 2010; however, as much of the preparation briefing had been provided to the Board well before the meeting, this was difficult to do. You will note, in the resolutions from Trondheim, that staff is directed to determine if the directions indicated by the Board are consistent with GAC comments, and recommend any appropriate further action in light of the GAC’s comments.

The adopted Board resolutions from the Trondheim meeting are available at:

I would encourage the GAC to read these resolutions in conjunction with the response to the GAC letter.

As you will appreciate, the development of the Applicant Guidebook and the resolution of the overarching issues identified during the process, has been a challenging task. The multi-stakeholder model under which ICANN operates means that we are responsible to a diverse range of stakeholders, and I believe that the ICANN community has done an outstanding job of considering, in many cases, diverse views on issues and finding workable solutions. That said, we do recognize that the new gTLD process cannot be all things to all people, and that some issues can be better addressed in successive rounds.
The guiding principles in developing the Applicant Guidebook have been to: preserve DNS stability and security; provide a clear, predictable and smooth running process; and, address and mitigate risks and costs to ICANN and the global Internet community. The Applicant Guidebook was developed around the recommendations from the GNSO policy development process and one of the additional challenges for staff in this context, was to be careful not to reopen for debate issues that had been discussed and resolved during that process.

Root zone scaling

On 6 October 2010, staff published two root server scaling reports for public comment.

In the analysis done in the “Delegation Rate Scenarios for New gTLDs’, ICANN staff estimates that the expected rate of new TLDs entering the root will be of the order of 200 to 300. The same paper indicates that regardless of the number of applications, there will be a process-imposed limited in the addition of new TLDs of less than a maximum of 1000 new gTLDs per year. In addition, advice from the root zone operators indicates that delegation rates of up to 1000 can be accommodated.

Based on this analysis, and taking into consideration the results of the studies into the effects of scaling the root summarized in “Summary of the Impact of Root Zone Scaling,” ICANN believes that projected growth of the root zone will be well within what the root server system and the DNS as a whole can accept. However, with that said, a recommendation documented in “Summary of the Impact of Root Zone Scaling” is the establishment of a monitoring system to ensure that changes relating to scaling of the root management systems don’t go unnoticed prior to those changes becoming an issue. ICANN staff is currently evaluating the monitoring system and alerting mechanisms necessary to meet this recommendation.

Avoidance of congestion at the operational level is a requirement for moving forward with the new gTLD program; however, as documented in “Root Zone Augmentation and Impact Analysis”, a reasonably configured root server can easily support several orders of magnitude more IDN and generic top-level domains than are projected to be added in the foreseeable future. As discussed in the “Summary of the Impact of Root Zone Scaling”, scaling effects are much more likely to be felt within the context of internal ICANN systems, such as application processing, legal review, IANA processes, etc. ICANN staff will be carefully monitoring these internal systems to ensure resources are applied appropriately to meet demand.
Market and Economic Impacts

The analysis of whether new gTLDs should be introduced into the market place, and under what circumstances, was undertaken during the policy development process by the GNSO. As the GAC is aware, the Board approved the GNSO policy recommendations in June 2008, thereby agreeing to open up the new gTLD space and tasked staff with developing an implementation plan.

A number of economic studies have been undertaken to date and these were highlighted in my correspondence of 5 August 2010 to the GAC. We await the latest of these.

The economist reports to date reflect that the benefits of innovation, or the effectiveness of trademark protection developed by the intellectual property constituencies, are too speculative to predict with accuracy. However, the Board does not agree that “...an initial ‘fast track’ round for a limited number of non-controversial applications which should include a representative but diverse sample of community, cultural and geographical applications, would be a preferable course for ICANN to take.” The process outlined in the Applicant Guidebook already provides equity and fair play for all applicants globally. An attempt to limit the process to “non-controversial” would be by its very nature controversial, since it will provide a first movers advantage and an incentive for misuse of the process that would be difficult and expensive to manage. I note that at the time the Board was considering the Expression of Interest (EOI) proposal, which was also put forward as a proposal to assist with addressing the question of the economic impact of the introduction of new gTLDs, the GAC questioned the benefits of pursuing a separate EOI as it could distract attention and resources from finalizing the New gTLD Program.

The GAC has raised the issue of “track differentiation between categories” in their comments on versions 2 and 3 of the applicant guidebook, and while I appreciate that this is in a slightly different context, on previous occasions, I responded in essence that we are not opposed to categories, which we expect will become self-evident over time. However, the introduction of a number of new gTLD categories with a number of different accommodations will lead to a complex and difficult application, administration and evaluation process, in addition to a very complicated contractual compliance environment.

Registry-registrar separation

The Board agrees with the GAC that the registry-registrar separation issue must result in a solution that fosters competition and innovation in the DNS market. The Board notes that registries and registrars will continue to be subject to all applicable national and local laws intended to protect consumers and competition.
The GNSO recently confirmed that its Vertical Integration Working Group has been unable to achieve consensus on recommending a model for addressing vertical integration of registries and registrars. As indicated at the time of the publication of version 4 of the draft Applicant Guidebook, the Board again reviewed this issue on 9 November 2010, and voted to allow new gTLD registries to own registrars, opting not to create new rules prohibiting registrars from applying for or operating new gTLD registries.

Under the Board resolution additional enforcement mechanisms have been added. New gTLD registry agreements are to include: (1) a Code of Conduct prohibiting any misuse of data or other abusive conduct arising out of registry-registrar cross-ownership; (2) robust auditing requirements; (3) graduated sanctions up to and including contractual termination and punitive damages; and (4) ICANN's right to refer competition issues to appropriate government competition authorities.

The full resolution is available at: http://www.icann.org/en/minutes/resolutions-05nov10-en.htm

Protection of rights owners

The Board understands the concerns expressed by the GAC regarding the potential costs of defensive registrations, and notes that the community spent a significant amount of time considering this issue, notably through the Implementation Recommendation Team and the Special Trademark Issues Working Group. The Board considered the many recommendations and supports the resulting protections now outlined in the Applicant Guidebook. These include:

- The requirement for all new registries to offer a Trademark Claims service or a sunrise period at launch.
- The establishment of a Trademark Clearinghouse as a central repository for rights information, creating efficiencies for TM holders, registries, and registrars.
- The existing Uniform Domain Name Dispute Resolution Policy (UDRP) continues to be available where complainant seeks transfer of names. Compliance with UDRP decisions is required in all new, as well as existing, gTLDs.
- Implementation of a Uniform Rapid Suspension (URS) system that provides a streamlined, lower-cost mechanism to suspend infringing names.
- The requirement for all new gTLD operators to provide access to “thick” Whois data. This access to registration data aids those seeking responsible parties as part of rights enforcement activities.
• The availability of a post-delegation dispute resolution mechanism that allows rights holders to address infringing activity by the registry operator that may be taking place after delegation.

Each of these is intended to provide a path other than defensive registration for trademark holders.

The application process itself, based on the policy advice, contains an objection-based procedure by which a rights holder may allege infringement by the TLD applicant. A successful legal rights objection prevents the new gTLD application from moving forward: a string is not delegated if an objector can demonstrate that it infringes their rights.

The application form also requires applicants to disclose and describe the implementation of their proposed rights protection mechanisms during startup and launch of the TLD. This allows ICANN to ensure that the applicant will meet the minimum requirements, as well as providing the community with knowledge about that registry’s expected practices.

The Board does not concur with the GAC’s recommendation that the match criteria for searches be extended to include results that combine a trademark and a generic term such as “Kodakcameras” unless of course this is a registered trademark. Instead the Board has adopted the recommendations of the intellectual property community as represented in the IRT regarding match criteria.

In addition to the outreach that has already been conducted on the new gTLD program, a comprehensive four month communication campaign will be undertaken prior to the launch of new gTLDs.

Post delegation disputes with governments

Regarding the question of whether the operations of registry operators of “geo-TLDs” should conduct business under the legal framework of the country providing the letter of support or non-objection to ICANN: the government approving the applicant can impose that requirement on the applicant as a condition of support.

While an agreement between the gTLD registry and the government or public authority, would not be enforceable by ICANN, ICANN would comply with a legally binding decision from a court of competent jurisdiction. Further, if the application is submitted as a "community-based" TLD, the processes and remedies of the Registry Restrictions Dispute Resolution Procedure are also available to governments or public authorities.
Use of geographical names

The Board has sought to ensure, throughout the process of developing a framework for new gTLDs, that there is 1) a clear process for applicants, and 2) appropriate safeguards for the benefit of the broad community including governments. The current criteria for defining geographic names as reflected in version 4 of the Draft Applicant Guidebook are considered to best meet the Board’s objectives and are also considered to address to the extent possible the GAC principles. These compromises were developed after several consultations with the GAC – developing protections for geographical names well beyond those approved in the GNSO policy recommendations. The current definitions, combined with the secondary avenue of recourse available by way of objections were developed to address the GAC’s concerns.

A detailed account was provided in my letter of 5 August 2010, to the GAC.

Country and territory names

I understand that the issue of the use of country and territory names will not be part of the IDN ccPDP; however, the ccNSO is considering options available to consider this issue and the Board anticipates a policy process which provides direction on this issue. The Board will, after the first round of new gTLDs, reconsider the treatment of country and territory names in the new gTLD process.

As stated in previous communications, the Board sought to remove the ambiguity of the term ‘meaningful representation’ from the definition of country and territory names to provide greater clarity for applicants and appropriate safeguards for governments and the broad community. The current definition is objectively based on the ISO 3166-1 and other published lists to provide clarity for potential applicants and the community.

City names

It is acknowledged in the Guidebook (and in previous missives to the GAC) that city names present challenges because city names may also be generic terms or brand names, and in many cases no city name is unique. Unlike other types of geographic names, there are no established lists that can be used as objective references in the evaluation process. Thus, city names cannot be afforded universal protection. However, the process does provide a means for cities and applicants to work together where desired.
Applicants are required to provide a description/purpose for the TLD, and to adhere to the terms and conditions of submitting an application including confirming that all statements and representations contained in the application are true and accurate.

Objection process
The criteria for community objections was created with the possible objections to place names in mind and as such the objection process “appropriately enables governments to use this.” The New gTLD Dispute Resolution Procedure is outlined in an Attachment to Module 3, pp P-1 to P-11 and was also developed so that it is equally accessible to those who wish to utilize the process.

The Board discussed the GAC’s position that governments should not be required to pay a fee for raising objections to new gTLD applications, and does not agree with the GAC on this point. It is the Board’s view that governments that file objections should be required to cover costs of the objection process just like any other objector; the objection process will be run on a cost-recovery and loser-pays basis (so the costs of objection processes in which governments prevail will be borne by applicants). How would the dispute resolution process be funded: a speculative increase in application fees or increased fees to gTLD registrants? Either of these cases or others seem difficult to implement and unfair.

Letter of support
While appreciating that governments need time to consult internally before deciding whether to support an application, obtaining government support or non-objection is the responsibility of the applicant and is stated in Module 2 of the Applicant Guidebook. While it has not been decided how long the application period will be open from the time of launching the new gTLD program, there is a requirement that a four month communications campaign be undertaken prior to launch.

Legal recourse for applicants
As stated earlier in this letter, one of the guiding principles in developing the Applicant Guidebook has been to address and mitigate risks and costs to ICANN and the global Internet community.

ICANN reaffirms its commitment to be accountable to the community for operating in a manner that is consistent with ICANN’s Bylaws, including ICANN’s Core Values such as "making decisions by applying documented policies neutrally and objectively, with integrity and fairness." The Board does not believe however that ICANN should expose itself to costly lawsuits any more than is appropriate.
The new gTLD process has been carefully designed over several years with multiple opportunities for public comment in order to develop a well-documented process that can be operated neutrally and objectively to the maximum extent feasible, and with integrity and fairness. Also, all of ICANN’s standard accountability and review mechanisms will be available to all participants and affected parties in the new gTLD process, including ICANN’s reconsideration process, independent review, and the ICANN Ombudsman.

Based on the above, in Trondheim, the Board resolved that, "The Board approves the inclusion of a broad waiver and limitation of liability in the application terms and conditions.

Addressing the needs of developing countries

The Board notes that through the IDN ccTLD Fast Track process much has been done to meet the global public interest in promoting a fully inclusive and diverse Internet community and infrastructure, at very minimal cost to applicants. The new gTLD process has been developed on a cost-recovery model, and owing to a level of uncertainty associated with the launch of new gTLDs, the fee levels currently in the Applicant Guidebook will be maintained for all applicants.

As stated in correspondence to the GAC of 22 September 2010, ‘... the experience gained from the initial round of applications will inform decisions on fee levels, and the scope for discounts and subsidies in subsequent rounds. ICANN has always stated that the idea of fee categories and lower fees will be investigated after the first round and following removal of many of the contingencies and uncertainties.’

The Board supports the publication of a list of organizations that request assistance and organizations that state an interest in assisting with additional program development, for example pro-bono consulting advice, in kind support, or financial assistance so that those needing assistance and those willing to provide assistance can identify each other and work together. The new gTLD Deployment Budget, available at [http://www.icann.org/en/announcements/announcement-22oct10-en.htm](http://www.icann.org/en/announcements/announcement-22oct10-en.htm) contains US$200,000 to help identify, educate, and promote the organizations willing to provide such assistance and an additional US$100,000 has been added to the Application Processing Budget to increase Customer Support processes for all applicants.

Morality and Public Order

In accordance with the GAC request, ICANN has facilitated the cross-community discussions on the process for addressing the GNSO policy recommendation that, “[s]trings must not be contrary to generally accepted legal norms relating to morality and public order that are recognized under international principles of law.”
The Board welcomes the report from the Recommendation 6 Working Group and has requested staff to undertake analysis of the report to determine how recommendations could be incorporated into the Guidebook and conduct a consultation with the Working Group before the Cartagena meeting with the aim of finding additional areas of agreement for incorporation into the Applicant Guidebook.

I wish to make a few points regarding the GAC letter of 4 August on this topic. I do not consider this to be a stability issue per se but rather a policy issue where ICANN is implementing the consensus position developed by the GNSO. There are controversial names delegated and registered now at different levels of the domain name system that do not result in security or stability issues.

Additionally, the new gTLD implementation to date has addressed the issues described in the Affirmation of Commitments: competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection. The issues raised by the GAC are neither stability / security nor AoC issues – but they merit the full attention of the community.

The solution that appears in version 4 of the Applicant Guidebook was developed following extensive legal research that examined restrictions in a representative sample of countries, which included Brazil, Egypt, France, Hong Kong, Malaysia, South Africa, Switzerland and the United States of America. Various competing interests are potentially involved, for example the rights of freedom of expression versus sensitivities associated with terms of national, cultural, geographic and religious significance. While freedom of expression in gTLDs is not absolute, those claiming to be offended on national, cultural, geographic or religious grounds do not have an automatic veto over gTLDs. The standards summarized by Recommendation No. 6 indicate that a morality and public order objection should be based upon norms that are widely accepted in the international community.

In addition to the Draft Applicant Guidebook (Module 3), ICANN has published explanatory memoranda, dated 29 October 2008 http://www.icann.org/en/announcements/announcement-29oct08-en.htm and 30 May 2009 http://www.icann.org/en/topics/new-gtlds/morality-public-order-30may09-en.pdf, that set out the specific standards that have been adopted for such objections and the legal research upon which those standards is based.

Importantly, in addition to the Morality and Public Order objection and dispute resolution processes, the Community Objection standards were developed to address potential registration of names that have national, cultural, geographic and religious sensitivities.
I understand that some GAC members have expressed dissatisfaction with this process as it was first described in version 2 of the Guidebook. The treatment of this issue in the new gTLD context, was the result of a well-studied and documented process which involved consultations with internationally recognized experts in this area. Advice containing thoughtful proposals for amending the treatment of this issue that maintains the integrity of the policy recommendation would be welcomed. The expression of dissatisfaction without a substantive proposal, does not give the Board or staff a toehold for considering alternative solutions. While the report of the recently convened working group still does not constitute a policy statement as conceived in the ICANN bylaws, ICANN staff and Board are working to collaborate with the community to adopt many of the recommendations.

Once again, I appreciate the GAC’s commitment to the new gTLD process and hope you find this letter responsive to GAC concerns.

The proposed final version of the Applicant Guidebook has now been posted and I look forward to discussing the introduction of new gTLDs in Cartagena.

Regards,

Peter Dengate-Thrush

Chairman of the Board of Directors, ICANN

ICANN Board-GAC Consultation: Geographic Names

EXPLANATION OF ISSUE/HISTORY

The GAC Principles regarding New gTLDs contain two paragraphs addressing geographic names. Paragraph 2.21 relates to names at the top level and paragraph 2.72 relates to names at the second level. In its policy recommendations, the GNSO provided that no specific protections be put in place beyond those afforded in the objection and dispute resolution process:

- that community objection procedures provided protections the GAC sought at the top level, and
- protections at the second level should be left to individual registries.

There has been regular communication in the form of face-to-face meetings, communiqués and correspondence between the GAC, staff and the Board on the treatment of geographic names and other issues, since the Board approved the GNSO recommendations for the introduction of new gTLDs in Paris in June 2008.

Many amendments have been made to the Guidebook that incorporate GAC requests regarding the treatment of geographical names.

REMAINING AREAS OF DIFFERENCE:

1. The current Guidebook states that country and territory names will not be available in the first round. The GAC requests that Country and territory names not be available until the completion of the IDN ccPDP, and that it may be more appropriate to consider country and territory names outside the new gTLD program.

2. The current Guidebook protects country and territory names that appear on specific U.N. lists and their translations. The GAC requests that names by which countries, cities or regions are commonly known as, or abbreviations of, and which do not appear in the lists used to define geographic names in the Applicant Guidebook should also be given the same protection as names that do appear.

---

1 2.2 ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities.

2 2.7 Applicant registries for new gTLDs should pledge to:
   a) adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new gTLD;
   b) ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.
3. The current Guidebook states that applications for strings that match city names require approval of the relevant government if the applicant asserts in the application that the TLD will represent the city. The GAC requests that ICANN review applications to ensure applicants do not avoid the safeguards of government support by misstating that the intended use of the name is for non-community purpose.

With regard to issues 2. and 3. the GAC believes that prior reviews of new gTLD strings can serve as an “early warning” to applicants, providing an opportunity to amend or modify the proposed string prior to proceeding further in the application process or provide opportunities to determine whether the applicant is the sole appropriate manager or relevant authority for that particular string, or whether the proposed string is either too broad to effectively identify a single entity as the relevant authority or appropriate manager, of is sufficiently contentious that an appropriate manager cannot be identified and/or agreed. See Letter from GAC to ICANN, dated 22 November 2010 at http://www.icann.org/en/correspondence/dryden-to-dengate-thrush-22nov10-en.pdf

Based on the GAC’s comments on version 4 of the Applicant Guidebook, dated 23 September 2010, http://www.icann.org/en/correspondence/dryden-to-dengate-thrush-23sep10-en.pdf, and recent conversations with GAC members, the following areas, highlighted in bold, are considered outstanding. The Board position and rationale is as follows:

- **Country and territory names not be available in new gTLD rounds until the completion of the IDN ccPDP.**

  In correspondence to the GAC on 5 August 2010 and in response to GAC request, the Board Chair confirmed, after advice from the GAC and comments from the ccNSO, that country and territory names would not be available to delegation in the first round of the new gTLD application process. The issue of the use of country and territory names in general is considered as out of scope of the IDN ccPDP, and therefore linking the two processes does not appear appropriate.

  Prolonging the exclusion of country and territory names in further new gTLD rounds should not be decided before the process that will be used to deal with this issue is clarified. While it is not certain that the country name exclusion will be removed after the first round, the Board believes it is preferable not to prejudge that possibility at that stage.

  The ccNSO is considering the options available, and will advise the Board in due course. Modalities for subsequent rounds will be determined in view of these recommendations as well as community and GAC advice.
• **Names by which countries, cities or regions are commonly known as and which do not appear in the ISO lists should also be given the same protection as names that do appear.**

The Board has sought to ensure, throughout the process of developing a framework for new gTLDs, that there is a clear process for applicants, and appropriate safeguards for the benefit of the broad community including governments. The current criteria for defining geographic names as reflected in the Proposed Final Version of the Applicant Guidebook are considered to best meet the Board’s objectives and are also considered to address to the extent possible the GAC principles. These compromises were developed after several consultations with the GAC – developing protections geographic names well beyond those approved in the GNSO policy recommendations. These definitions, combined with the secondary avenue of recourse available by way of objections were developed to address the GAC’s concerns.

In developing the process for geographic names, ICANN has relied upon ISO or UN lists to assist with geographical definitions in the context of new gTLDs. The combined total of names currently protected in the new gTLD process is well in excess of 5000 names, and providing protection for “commonly used” interpretations of these names would multiply the number of names and the complexity of the process many-fold.

In correspondence to the GAC on 5 August 2010, the Board Chair indicated that the Board had sought to remove the ambiguity of the term ‘meaningful representation’ from the definition of country and territory names. The current definition is objectively based on the ISO 3166-1 and other published lists to provide greater clarity for applicants and appropriate safeguards for governments and the broad community.

Holland has been raised in this context as an example on a number of occasions by the GAC. However, while not appearing on the ISO 3166-1 list, Holland appears to be protected, as it the Danish translation of ‘the Netherlands’.

Language has been added to the Guidebook indicating that governments may send notifications regarding national laws directly to applicants or via public comment forum (see Applicant Guidebook, Module 1, section 1.1.2.5 http://www.icann.org/en/topics/new-gtlds/draft-rfp-clean-12nov10-en.pdf) once the applications are publicly posted. Such notifications are not meant to serve as formal objections or be cause for a modification to an application. It was decided early in the process development that applicants should not be able to amend applications or applied for strings in order to prevent abuses.
• **ICANN to review the proposal for city names in the applicant guidebook to ensure applicants do not avoid the safeguards of government support or non-objection by stating that the intended use of the name is for non-community purposes.**

It is acknowledged in the Guidebook (and in correspondence and discussions with the GAC) that city names present challenges because city names may also be generic terms or brand names and, in many cases, no city name is unique. Unlike other types of geographic names, there are no established lists that can be used as objective references in the evaluation process. This makes it impracticable or impossible for evaluators to effectively check whether applications for strings are city names and would exclude thousands of legitimate uses and applications. In addition, given that many of the names of cities are duplicated across the world, it would be impracticable for the evaluators to determine which government or public authority is ‘relevant’ in the context of the rules of the Applicant Guidebook. Thus, all city names are not afforded the same types of protection as country and capital city names.

However, an application for a *city name*, where the applicant declares that it intends to use the gTLD for purposes associated with the city name, will require support or non-objection from the relevant government or public authority.

Applicants are required to provide a description/purpose of what the TLD will be used for, and to adhere to the terms and conditions of submitting an application including confirming that all statements and representations contained in the application are true and accurate. The Registry Agreement has the same clause.

Language has been added to the Guidebook indicating that governments may send notifications regarding national laws directly to applicants or via public comment forum (see Applicant Guidebook, Module 1, section 1.1.2.5 http://www.icann.org/en/topics/new-gtlds/draft-rfp-clean-12nov10-en.pdf) once the applications are publicly posted. Such notifications are not meant to serve as formal objections or be cause for a modification to an application. It was decided early in the process development that applicants should not be able to amend applications or applied for strings in order to prevent abuses.

**RELEVANT GUIDEBOOK SECTIONS**

**1.1.2.5 Public Comment**

...Governments may provide a notification using the public comment forum to communicate concerns relating to national laws. However, a government’s notification of
concern will not in itself be deemed to be a formal objection. A notification by a
government does not constitute grounds for rejection of a gTLD application.

Governments may also communicate directly to applicants using the contact information
posted in the application, e.g., to send a notification that an applied-for gTLD string might
be contrary to a national law, and to try to address any concerns with the applicant.

As noted above, applicants are encouraged to identify potential sensitivities in advance
and work with the relevant parties to mitigate concerns related to the application...

2.2.1.4.1 Treatment of Country or Territory Names

Applications for strings that are country or territory names will not be approved, as they
are not available under the New gTLD Program in this application round. A string shall be
considered to be a country or territory name if:

i. it is an alpha-3 code listed in the ISO 3166-1 standard.

ii. it is a long-form name listed in the ISO 3166-1 standard, or a translation of the
    long-form name in any language.

iii. it is a short-form name listed in the ISO 3166-1 standard, or a translation of the
    short-form name in any language.

iv. it is the short- or long-form name association with a code that has been
    designated as “exceptionally reserved” by the ISO 3166 Maintenance Agency.

v. it is a separable component of a country name designated on the “Separable
    Country Names List,” or is a translation of a name appearing on the list, in any
    language. See the Annex at the end of this module.

vi. It is a permutation or transposition of any of the names included in items (i)
    through (v). Permutations include removal of spaces, insertion of punctuation,
    and addition or removal of grammatical articles like “the.” A transposition is
    considered a change in the sequence of the long or short–form name, for
    example, “RepublicCzech” or “IslandsCayman.”

2.2.1.4.2 Geographic Names Requiring Government Support

The following types of applied-for strings are considered geographic names and must be
accompanied by documentation of support or non-objection from the relevant
governments or public authorities:
1. An application for any string that is a representation, in any language, of the
capital city name of any country or territory listed in the ISO 3166-1 standard.

In this case, it is anticipated that the relevant government or public authority
would be at the national level.

2. An application for a city name, where the applicant declares that it intends to use
the gTLD for purposes associated with the city name.

City names present challenges because city names may also be generic terms or
brand names, and in many cases no city name is unique. Unlike other types of
geographic names, there are no established lists that can be used as objective
references in the evaluation process. Thus, city names are not universally
protected. However, the process does provide a means for cities and applicants to
work together where desired.

An application for a city name will be subject to the geographic names
requirements (i.e., will require documentation of support or non-objection from
the relevant governments or public authorities) if:

(a) It is clear from applicant statements within the application that the
applicant will use the TLD primarily for purposes associated with the city
name; and

(b) The applied-for string is a city name as listed on official city documents.\(^4\)

In the case of an application that meets conditions (a) and (b), documentation of
support will be required only from the relevant government or public authority of
the city named in the application.

3. An application for any string that is an exact match of a sub-national place name,
such as a county, province, or state, listed in the ISO 3166-2 standard.

In this case, it is anticipated that the relevant government or public authority
would be at the sub-national level, such as a state, provincial or local government
or authority.

4. An application for a string listed as a UNESCO region\(^5\) or appearing on the
“Composition of macro geographical (continental) regions, geographical sub-
regions, and selected economic and other groupings” list.\(^6\)

In the case of an application for a string appearing on either of the lists above,
documentation of support will be required from at least 60% of the respective

---

\(^4\) City governments with concerns about strings that are duplicates, nicknames or close renderings of a city
name should not rely on the evaluation process as the primary means of protecting their interests in a
string. Rather, a government may elect to file a formal objection to an application that is opposed by the
relevant community, or may submit its own application for the string.

national governments in the region, and there may be no more than one written statement of objection to the application from relevant governments in the region and/or public authorities associated with the continent or the region.

Where the 60% rule is applied, and there are common regions on both lists, the regional composition contained in the “composition of macro geographical (continental) regions, geographical sub-regions, and selected economic and other groupings” takes precedence.

An applied-for gTLD string that falls into any of 1 through 4 listed above is considered to represent a geographic name. In the event of any doubt, it is in the applicant’s interest to consult with relevant governments and public authorities and enlist their support or non-objection prior to submission of the application, in order to preclude possible objections and pre-address any ambiguities concerning the string and applicable requirements.

In the event that there is more than one relevant government or public authority for the applied-for gTLD string, the applicant must provide documentation of support or non-objection from all the relevant governments or public authorities. It is anticipated that this may apply to the case of a sub-national place name.

It is the applicant’s responsibility to:

• identify whether its applied-for gTLD string falls into any of the above categories; and
• determine the relevant governments or public authorities; and
• identify which level of government support is required.

The requirement to include documentation of support for certain applications does not preclude or exempt applications from being the subject of objections on community grounds (refer to subsection 3.1.1 of Module 3), under which applications may be rejected based on objections showing substantial opposition from the targeted community.

SUMMARY OF ACTIONS TAKEN RESPONDING TO GAC AND PUBLIC COMMENTS

Use and protection of geographical names

• The inclusion of geographic names, as defined in the Guidebook, was developed in response to GAC principle 2.2.

• The protection of government interests in geographic names is accounted for by the requirement that no application for a geographic name (as defined in the Guidebook) can be approved without documentation of the support or non-objection from the relevant government or public authority.

• Country and territory names, as defined in the Applicant Guidebook, have been excluded from the first application round of the gTLD process based on GAC advice.

• A minimum list of reserved names was added to the Registry Agreement based on GAC principle 2.7 which called for protections at the second level. Similarly, all applicants are required to describe in the application their proposed measures for ensuring the protection of geographic names at the second and other levels in the TLD. This information is posted for public information and comment, in accordance with GAC advice.

• The capacity for an objection to be filed on community grounds, where there is substantial opposition to an application from a community that is targeted by the name also provides an avenue of protection for names of interest to a government which are not defined in the Applicant Guidebook.

<tr>
<td>2.2 ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities.</td>
<td>2.2) is addressed by the GNSO Recommendation 20; “An application will be rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted.” providing grounds for an objection process and subsequent dispute resolution handling, as further developed in GNSO Implementation Guideline P. The GNSO Implementation Guideline H* is also of relevance in this context. Further guidance is provided by the GNSO Reserved Names WG Recommendation 20: “There should be no geographical reserved names (i.e., no exclusionary list, no presumptive right of registration, no separate administrative procedure, etc.). The proposed challenge mechanisms currently being proposed in the draft new gTLD process would allow national or local governments to initiate a challenge, therefore no additional protection mechanisms are needed. Potential applicants for a new TLD need to represent that the use of the proposed string is not in violation of the national laws in which the applicant is incorporated. However, new TLD applicants interested in applying for a TLD that incorporates a country, territory, or place name should be advised of the GAC principles, and the advisory role vested to it under the ICANN bylaws. Additionally, a summary overview of the obstacles encountered by previous applicants involving similar TLDs should be provided to allow an applicant to make an informed decision. Potential applicants should also be advised that the failure of the GAC, or an individual GAC member, to file a challenge during the TLD application process, does not constitute a waiver of the authority vested to the GAC under the ICANN bylaws.”</td>

</tbody>
</table>

Issues regarding geographical names in relation to the introduction of new gTLDs have been discussed by other entities in the ICANN community, including the ccNSO (see
http://ccnso.icann.org/meetings/losangeles/ccnso-council-minutes-31oct07.pdf]

From an implementation perspective, it is foreseen that corresponding requirements regarding documentation of government ascent be clearly stated to the applicants and all relevant applications be checked for compliance as appropriate.

In the absence of a reservation approach, the gTLD application process being developed by ICANN staff proposes to integrate the above GAC principle as outlined below.

Applicants wishing to apply for a gTLD string that is a meaningful representation of the name of a country or territory listed in ISO 3166-1 (in any script), should be prepared to provide documented support or documented lack of objection from the relevant government or public authority. This would be a considered a criterion for an applicant to pass the initial evaluation stage of the process.

In the case of an application for a string that the application evaluators believe is a meaningful representation of the name of a country or territory on the ISO 3166-1 list, where the application did not include documentation of agreement by the relevant government or public authority, ICANN would require the applicant to refer the application to the government or public authority to obtain an expression of support or of "no objection." In the absence of such an expression, the application would proceed no further toward approval.

Consistent with the GNSO Reserved Names Working Group’s recommendation that potential applicants should be informed of the relevant constraints, the above procedure would be fully disclosed and documented in the Request For Proposals (RFP) for new gTLDs. Applicants could choose how to proceed based on knowledge of the steps they would be required to follow.

This approach is in line with principles that have historically been applied in ccTLD delegation and redelegation processes. As noted in RFC 1591 (Domain Name System Structure and Delegation) and ICP-1, Internet Domain Name System Structure and Delegation (ccTLD Administration and Delegation):

The desires of the government of a country with regard to delegation of a ccTLD are taken very seriously. The IANA will make them a major consideration in any TLD delegation/transfer discussions. Significantly interested parties in the domain should agree that the proposed TLD manager is the appropriate party. (see http://www.isi.edu/in-notes/rfc1591.txt; http://www.icann.org/icp/icp-1.htm).

The above procedure refers to a string that is a meaningful representation of the name of a country or territory on the ISO 3166-1 list. For strings denoting other geographical identifiers (for example: landmarks, rivers, cities), the objection
mechanism would remain available to significantly interested stakeholders, including governments. Objections to geographical identifiers other than country names would trigger a dispute resolution process where these issues can be properly adjudicated based on the particular circumstances. Note that the GNOSO anticipated that the implementation of the objection process that addresses recommendation 20 (described above) would be adequate to address applications for meaningful representations of country names. There is some discussion among the council that the procedure described in this implementation detail to consult with governments is not required. It is not clear though that the process of government consultation differs from the GNOSO policy implementation. Consultation will continue with GAC and council to provide clear information regarding implementation.

2.7a) The GNOSO Reserved Names WG considered geographical and geopolitical names without recommending that they be reserved at the outset, stating in their report: “In the case of geographical/geopolitical names and controversial names, it was very difficult if not impossible to define clear reservation requirements that could be applied for all new gTLDs”.

The GNOSO Reserved Names WG report also states that: “Protection afforded to Geographic indicators is an evolving area of international law in which a one-size fits all approach is not currently viable. The proposed recommendations in this report are designed to ensure that registry operators comply with the national laws for which they are legally incorporated/organized.”

Further guidance is provided by the GNOSO Reserved Names WG Recommendation 22: “The consensus view of the working group is given the lack of any established international law on the subject, conflicting legal opinions, and conflicting recommendations emerging from various governmental fora, the current geographical reservation provision contained in the sTLD contracts during the 2004 Round should be removed, and harmonized with the more recently executed .COM, .NET, .ORG, .BIZ and .INFO registry contracts. The only exception to this consensus recommendation is those registries incorporated/organized under countries that require additional protection for geographical identifiers. In this instance, the registry would have to incorporate appropriate mechanisms to comply with their national/local laws. For those registries incorporated/organized under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly, it is strongly

the GAC. Letter outlines proposal for way forward re para 2.2:

- Supporting documentation, evidence of non-objection, from the relevant government or public authority will be required for strings which represent a country or territory name. ISO 3166-1 list will be used as reference list.

- Place names was considered very broad and were defined as:
  - sub-national geographic identifiers such as counties, states, provinces. The ISO 3166-2 identified as the reference list, and support documentation, evidence of non-objection required;
  - city names are challenging because a city name can also be a generic term, or a brand name, and in many cases no city name is unique. Therefore, an applicant that clearly intends to use the TLD to leverage the city name, will require supporting documentation.

- Regional language and people descriptions—difficult to determine the relevant government or public authority for a string which represents a language or people description as there are generally no recognized established rights for such descriptions

**Paragraph 2.7 (a)**

- ICANN would be reluctant to place blanket restrictions on the use of geo names at the second level due to anticipated multi-national companies expected to apply for a brand name. Names with national and geographic significances difficult to define.

**Paragraph 2.7(b)**

- Names with national and geographic significance are difficult to define, as is what constitutes an ‘abuse’ of a name. UDRP protects rights at the second level.

---

**5 November 2008: Communiqué Cairo**

Appreciates level of engagement inter-sessionally with ICANN staff which lead to better reflection of the GAC principles in New gTLDs in the DAG, particularly principles 2.2 and 2.6. As a result became more sensitive to the potential blurring of the existing distinction between the ccTLD and gTLD namespace.

Questions related to consideration of country and territory names need to be
addressed further. Will continue consideration of whether the strings being meaningful representations or abbreviations of a country or territory name in any script or language should not be allowed in the gTLD space until the related ccTLD PDP is completed.

The procedure recommended in 2.7a of the GAC principles also needs to be further considered in the DAG.

| • Board believes treatment of geographic names at the top level provides a
workable compromise between paragraph 2.2 and the GNSO’s policy recommendation 20.

- Seeks the GAC’s members input on possible options to resolve the outstanding implementation issues regarding the protection of geographic names at the second level, specifically paragraph 2.7.

### 24 April 2009: Letter from GAC Chair to ICANN CEO
http://www.icann.org/correspondence/karklins-to-twomey-24apr09.pdf

- **Geographic Names at the top level:**
  - Rights of governments or public authorities in relation to the rights of the sovereign state or territory which they represent cannot be limited or made conditional by any procedures that ICANN introduces for new gTLDs.
  - It would be sensible to enable Governments (or the GAC) to object to an application for a gTLD on public interests grounds without going through the time and cost of the formal objection process.
  - ccNSO approach that country and territory names on the ISO list are treated as ccTLDs seems to be a sensible approach to ensure that geographic names are afforded sufficient protection.

- **Geographic names at the second level:**
  - Registries should be asked to indicate how they intend to incorporate GAC advice in their management of second level domains.
  - .info procedure could be drawn upon as an example
  - At a minimum, the names contained on three lists [ISO 3166-1; United Nations Group of Experts on Geographical Names, Part III Names of Countries of the World; and List of UN member states in 6 official UN languages prepared by the Working Group on Country Names of the United nations conference on the standardization of Geographical Names] must be reserved at the second level at no cost for the governments of all new gTLDs.

- **Potential misuse of respective names on the second level**

In the event that a government notifies ICANN that there is misuse of any second level domain name, ICANN shall notify the registry and request the suspension of
the said name pending the withdrawal of the objection.

**26 May 2009: Letter from GAC Chair to ICANN CEO**
http://www.icann.org/correspondence/karklins-to-twomey-29may09-en.pdf

- Proposal in relation to geographic names at the second level is acceptable to the GNSO, and is repeated in the letter.

Notes that on other issues relating to geographic names at the top level and the potential misuse of the respective names on the second, the GNSO and GAC are not in agreement. The GAC will engage in further discussion in Sydney.

**24 June 2009: Communiqué Sydney**
The GAC discussed the Draft Applicant Guidebook version 2 and feels that it does not yet respond to all the concerns that governments have. The GAC notes that considerable work is underway seeking to address several critical yet outstanding issues but the GAC remains concerned about a number of important issues:
- The need to ensure respect for national and public policy interests, in particular the need for adequate protection of geographic names (on the top and the second levels) and delegation/re-delegation procedures;

<table>
<thead>
<tr>
<th>Reply from ICANN Chairman 22 September 2009</th>
</tr>
</thead>
</table>

While understanding the sentiment that a country name TLD should be treated as a ccTLD, ICANN policy constrains the way in which it is possible to provide country name TLDs to all countries and territories is under the new gTLD program at this time. The treatment of country and territory names, in version 2 of the Draft Applicant Guidebook, was developed in the context of the points raised by the GAC, the ccNSO, and the GNSO policy recommendations and trying to find a balance among the somewhat contrary views. Applications for country and territory names

---

1 Meaningful representations of country or territory names in non-Latin scripts will be available under the IDN Fast Track process but country and territory names in Latin scripts are available in the gTLD program only, until the ccTLD policy development is complete.
The GAC is of the opinion that the DAG2 is a substantial improvement on its predecessor, but that it does not yet fully reflect the GAC position that governments and other public authorities, as representatives of citizens of a sovereign state, territory, province or city, have a legitimate interest in the use of geographical names as new TLDs.

The GAC therefore proposes the following amendments to be incorporated in version 3 of the Draft Applicant Guidebook (further in the text - DAG3):

**i. Strings that are a meaningful representation or abbreviation of a country name or territory name should not be allowed in the gTLD space**

These strings represent countries or territories and the principle of sovereignty must apply. TLDs in this category should therefore be treated in the same way as ccTLDs.

The use of exhaustive listings (e.g. ISO 3166-1) will not cover all the ccTLD-like applications envisaged by the GAC and ccNSO, in particular in the following categories:

- ‘Commonly referred to as’ type strings representing a country or territory but which are not official titles, e.g. .america, .ceylon, .holland;
- Common or general names that are often applied to more than one country, e.g. .guinea

will require evidence of support or non-objection from the relevant government or public authority which is consistent with GAC principle 2.2.2, and that evidence must clearly indicate that the government or public authority understands the purpose of the TLD string and the process and obligations under which it is sought.

Safeguards have been developed to ensure that the relevant government or public authority’s sovereign rights are respected, and that the process is understood. It is ultimately the government or public authority’s discretion whether to support, or not support, an application for a country name TLD, and the circumstances under which they would be willing to do so.

The Board raised concerns that the criteria for country and territory names, as it appeared in version 2 of the Draft Applicant Guidebook was ambiguous and could cause uncertainty for applicants. Subsequently, on 6 March 2009, the ICANN Board directed staff to, among other things, “…revise the relevant portions of the draft Applicant Guidebook to provide greater specificity on the scope of protection at the top level for the names of countries and territories listed in the ISO 3166-1 standard”.

The revised definition, provided in a Geographical Names excerpt of the guidebook posted on 30 May 2009, continues to be based on the ISO 3166-1 standard and fulfills the Board’s requirement of providing greater clarity about what is considered a country or territory name in the context of new gTLDs. It also removes the ambiguity that resulted from the previous criteria that the term ‘meaningful representation’ created.

The Board’s intent is, to the extent possible, to provide a bright line rule for applicants. While the revised criteria may have resulted in some changes to what names are afforded protection, it has not changed the original intent to protect all names listed on the ISO 3166-1 list, including the short or long form of the name. It is felt that the sovereign rights of governments continue to be adequately protected as the definition is based on a list developed and maintained by an international organisation.

In the context of the revised definition, the name America is afforded protection.

---

2 ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities
while the names Ceylon and Holland are not. However, the objection process does provide a secondary avenue of recourse. An application will be rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted. With regard to the names .Guinea and .Guinea-Bissau; only the relevant government or public authority for the respective countries can agree to support, or not-object, to the use of their respective names.

### 10 March 2010: Comments on V3 of Applicant Guidebook

The GAC restates the advice contained in the Chair’s letter of 18 August 2009 which states: “Strings that are a meaningful representation or abbreviation of a country name or territory name should not be allowed in the gTLD space”. The GAC interprets para 2.2 of the GAC gTLD principles that strings which are a meaningful representation or abbreviation of a country or territory name should be handled through the forthcoming ccTLD PDP, and other geographical strings could be allowed in the gTLD space if in agreement with the relevant government or public authority.

---

The GAC is of the view that the definition of geographical strings continues to be insufficient and is not in line with GAC gTLD principles paras 2.2 and 2.7. For example, commonly used abbreviations or regions not listed in ISO 3166-2 should

---

3 “The GAC interprets para 2.2 of the GAC gTLD principles that the strings that are meaningful representation or abbreviation of a country or territory name should be handled through the forthcoming ccTLD PDP, and other geographical strings could be allowed in the gTLD space if in agreement with the relevant government or public authority.”
also be considered as geographical names.

first round of the new gTLD application process.

With regard to the definition of country names, the Board has sought to ensure both clarity for applicants, and appropriate safeguards for governments and the broad community. A considerable amount of time has been invested in working through the treatment of country and territory names to ensure it meets these two objectives. Following discussion at the Mexico City meeting, the Board recommended that the Applicant Guidebook be revised in two areas regarding this subject: (1) provide greater specificity as to what should be regarded as a representation of a country or territory name in the generic space, and (2) provide greater specificity in defining the qualifying support requirements for continent names, with a revised position to be posted for public comment.

The resulting definition for country and territory names is based on ISO 3166-1 and other published lists to provide clarity for potential applicants and the community. It seeks to remove the ambiguity created by use of the term ‘meaningful representation.’ Therefore, the definition of country and territory names has not been amended in the recent Guidebook draft and remains consistent with the Board goals and resolution on this issue.

While the revised criteria may have resulted in some changes to what names are afforded protection, there is no change to the original intent to protect all names listed in ISO 3166-1 or a short or long form of those names (and, importantly, translations of them). This level of increased clarity is important to provide process certainty for potential TLD applicants, governments and ccTLD operators – so that it is known which names are provided protections.

The definition is objectively based on the ISO list, which is developed and maintained by a recognised international organisation.

It is acknowledged that ICANN has used the concept of ‘meaningful representation’ of a country or territory in the context of the IDN ccTLD Fast Track. This reflects the objective of rapid initial deployment of IDNs and the associated need to remove as many potential obstacles as possible. There have always been particular sensitivities about geographic names where non-Latin scripts and a range of languages are involved. It does not follow that these considerations should automatically apply to the broader ccTLD and gTLD spaces. It is reasonable that the criteria for including names (the Fast Track) could be different than the criteria for excluding names (gTLDs).

The ccNSO will be undertaking policy discussions, which may result in a change in
position on these two issues. In particular, defining the distinction between country code and generic names may warrant a broader cross-SO/AC policy discussion. Once policy is developed, it will be appropriate for the Board to reconsider these positions.

<td></td>
<td></td>
</tr>
<tr>
<td>23 September 2010: Comments on V4 of Applicant Guidebook</td>
<td>The GAC appreciates the work undertaken by ICANN to address the GAC’s concerns relating to the use of geographical names. In particular, the GAC welcomed the addition of the clearly stated provision in version 4 of the DAG that country and territory names are to be excluded from the first application round. However, as stated in its Nairobi communiqué, the GAC underlines that this exclusion should be prolonged until the completion of the ccPDP. The GAC notes that the guide still does not take fully into consideration the GAC’s concerns about extending the protection of geographical names. The GAC remains of the view that the definition of geographical strings continues to be insufficient and inconsistent with GAC gTLD principles and earlier advice by the GAC. In particular, names by which countries are commonly known as and which do not appear in ISO lists should also be given the same protection as country names that do appear. The GAC notes that ICANN referred governments to the “secondary avenue of recourse available by way of objections” in the Chair’s letter of 5 August 2010. The GAC therefore asks ICANN to ensure that the criteria for community objections are implemented in a way that appropriately enables governments to use this instrument to protect their legitimate interests. Applications for gTLDs which are city names will need careful handling. The GAC considers that the provisions in version 4 of the DAG in relation to city names carry the danger that an applicant could seek to avoid the safeguards of government support or non-objection if the application simply states that the intended use of the name is for non-community purposes. The GAC asks ICANN to review the proposal in the DAG in order to ensure that this potential loophole does not arise.</td>
<td><a href="http://www.icann.org/en/topics/new-gtlds/draft-rfp-clean-28may10-en.pdf">http://www.icann.org/en/topics/new-gtlds/draft-rfp-clean-28may10-en.pdf</a></td>
</tr>
<tr>
<td>23 November 2010: Reply from ICANN Chairman</td>
<td>The Board has sought to ensure, throughout the process of developing a framework for new gTLDs, that there is 1) a clear process for applicants, and 2) appropriate safeguards for the benefit of the broad community including governments. The current criteria for defining geographic names as reflected in version 4 of the Draft Applicant Guidebook are considered to best meet the Board’s objectives and are also considered to address to the extent possible the GAC principles. These compromises were developed after several consultations with the GAC — developing protections for geographical names well beyond those approved in the GNSO policy recommendations. The current definitions, combined with the secondary avenue of recourse available by way of objections were developed to address the GAC’s concerns. A detailed account was provided in my letter of 5 August 2010, to the GAC.</td>
<td><a href="http://www.icann.org/en/correspondence/dengate-thrush-to-dryden-23nov10-en.pdf">http://www.icann.org/en/correspondence/dengate-thrush-to-dryden-23nov10-en.pdf</a></td>
</tr>
</tbody>
</table>
The GAC takes this opportunity to remind the Board that governments need time to consult internally before deciding on whether or not to deliver a letter of approval or non-objection, in particular in cases there is more than one application for a string with a geographical name. This timeline needs to be factored into the DAG advice.

on the ISO 3166-1 and other published lists to provide clarity for potential applicants and the community.

City names
It is acknowledged in the Guidebook (and in previous missives to the GAC) that city names present challenges because city names may also be generic terms or brand names, and in many cases no city name is unique. Unlike other types of geographic names, there are no established lists that can be used as objective references in the evaluation process. Thus, city names can not be afforded universal protection. However, the process does provide a means for cities and applicants to work together where desired.

Applicants are required to provide a description/purpose for the TLD, and to adhere to the terms and conditions of submitting an application including confirming that all statements and representations contained in the application are true and accurate.

Letter of support
While appreciating that governments need time to consult internally before deciding whether to support an application, obtaining government support or non-objection is the responsibility of the applicant and is stated in Module 2 of the Applicant Guidebook. While it has not been decided how long the application period will be open from the time of launching the new gTLD program, there is a requirement that a four month communications campaign be undertaken prior to launch.

Board Briefing Materials:
One [PDF, 3.23 MB]
Two [PDF, 2.03 MB]
Three [PDF, 816 KB]
Four [PDF, 240 KB]
Five [PDF, 546 KB]

“...Whereas, on 23 September 2010, the Governmental Advisory Committee (GAC) provided comments on version 4 of the draft Applicant Guidebook.
Resolved (2010.09.25.___), staff is directed to determine if the directions indicated by the Board below are consistent with GAC comments, and recommend any
appropriate further action in light of the GAC's comments."

**Geographic Names**

Sub-national place names: Geographic names protection for ISO 3166-2 names should not be expanded to include translations. Translations of ISO 3166-2 list entries can be protected through community objection process rather than as geographic labels appearing on an authoritative list.

Continents and UN Regions: The definition of Continent or UN Regions in the Guidebook should be expanded to include UNESCO’s regional classification list which comprises: Africa, Arab States, Asia and the Pacific, Europe and North America; Latin America and the Caribbean.

Governments that file objections should be required to cover costs of objection process just like any other objector; the objection process will be run on a cost-recovery and loser-pays basis (so the costs of objection processes in which governments prevail will be borne by applicants). Also, the Board notes that the GAC proposal for free government objections is not specific as to particular objection grounds or particular government objectors (for example whether both national and local government objectors would be covered).

From: On Behalf Of Peter Dengate Thrush  
Sent: Saturday, March 05, 2011 12:50 PM  
To: Heather Dryden  
Cc: ICANN Board of Directors  
Subject: ICANN Board Directors - Documenting the Board/GAC Brussels consultation  

Dear Heather,

On behalf of the Board of Directors of ICANN, I would like to formally thank the ICANN's Governmental Advisory Committee for participating in the first intersessional Board/GAC meetings, held in Brussels on 28 February and 1 March 2011, regarding ICANN's proposed implementation of the new gTLD program.

We appreciate the preparatory work and time commitment of the GAC Members in participating in these discussions. We also look forward to continuing to work with you on the best ways to evaluate and implement changes to the program resulting from your advice, in the consultation scheduled to be held at the Silicon Valley ICANN Meetings to be held in San Francisco later this month. We are still holding the 17 March consultation slot open and look forward to adding the other day to these consultations following on from your recent offer to be available for this additional time.

The Board looks forward to continuing to collaborate with the GAC in order to conclude the consultation process on the new gTLD program during the Silicon Valley/San Francisco Meeting.

The Board has made a good faith effort toward narrowing the outstanding issues as evidenced by the production of Board Papers, and the subsequent use of the GAC scorecard to frame and shape the issues. The clarity gained during these efforts has significantly reduced the amount of work that needs to be done in order to reach agreement on most issues.

We have included the ICANN Board's response to the GAC scorecard entitled 'Board Notes GAC Actionable Scorecard, attached. We have provided this response, to set out information regarding the Board's evaluation of the GAC advice, which has been summarized within your scorecard. We look forward to discussing this with you further as part of the evaluation. The issues that you have raised are responded to point-by-point.

While discussion in Brussels confirmed that we would work together to clarify implementation of the issues marked as "1(b)", a narrowed focus in San Francisco on the issues that are still in contention would be a best use of the Board and GAC's time during the two days of consultations, and should represent the final stages in our required consultation. Accordingly, we propose focusing there on those items marked with a "2", in the Board's response to the Scorecard attached. Those items marked 1(b) might result in follow on discussions with the GAC regarding implementation in the time leading up to the launch of the program, but do not appear that they will require the same consultation that we have triggered on the "2" since we are not in fundamental disagreement on those items categorized as 1(b)'s.
This document contains the ICANN Board's notes on the "GAC indicative scorecard on new gTLD outstanding issues" of 23 February 2011. Each GAC scorecard item is noted with a "1A", "1B", or "2":

- "1A" indicates that the Board's position is consistent with GAC advice as described in the Scorecard.
- "1B" indicates that the Board's position is consistent with GAC advice as described in the Scorecard in principle, with some revisions to be made.
- "2" indicates that the Board's current position is not consistent with GAC advice as described in the Scorecard, and further discussion with the GAC in San Francisco is required.

<table>
<thead>

| applications. Implement a free objection mechanism would allow governments to protect their interest. | | members could be exempted from paying fees for objections in some circumstances (subject to constraints imposed by budget and other considerations). | |
| 8.2.1 | **2. Further requirements regarding geographic names**
The GAC clarifies that it is a question of national sovereignty to decide which level of government or which administration is responsible for the filing of letters of support or non-objection. There may be countries that require that such documentation has to be filed by the central government - also for regional geoTLDs; in other countries the responsibility for filing letters of support may rest with sub-national level administrations even if the name of the capital is concerned. GAC requests some clarification on this in the next version of the | 1A | This principle is agreed, and this can be clarified in the Guidebook. ICANN invites governments to identify appropriate points of contact on this issue. |

</tbody>
</table>

8.2.2 According to the current DAG applications will be suspended (pending resolution by the applicants), if there is more than one application for a string representing a certain geographic name, and the applications have requisite government approvals. The GAC understands such a position for applications that have support of different administrations or governmental entities. In such circumstances it is not considered appropriate for ICANN to determine the most relevant governmental entity; the same applies, if one string represents different geographic regions or cities. Some governments, however, may prefer not to select amongst applicants and support every application that fulfils certain

| | 1B | ICANN will continue to suspend processing of applications with inconsistent/conflicting support, but will allow multiple applicants all endorsed by the same authority to go forward, when requested by the government. This area needs further discussion on the potential situations that could lead to redelegation requests. |

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

9. **Legal Recourse for Applications:**

9. Seek legal advice in major jurisdiction whether such a provision might cause legal conflicts – in particular but not limited to US and European competition laws. If ICANN explains that it has already examined these legal questions carefully and considering the results of these examinations still adheres to this provision, GAC will no longer insist on its position. However, the GAC expects that ICANN will continue to adhere to the rule of law and follow broad principles of natural law.

As discussed with the GAC, ICANN has examined these legal questions carefully and considering the results of these examinations still adheres to this provision. ICANN will clarify in the Applicant Guidebook that: if ICANN deviates from its agreed processes in coming to a decision, ICANN's internal accountability mechanisms will allow complaints to be heard.

NEW gTLDs APPLICANT GUIDEBOOK APRIL 2011
DISCUSSION DRAFT

PUBLIC COMMENT SUMMARY AND ANALYSIS

Sources:

GENERAL COMMENTS

Support for New gTLD Program

Key Points

- As in previous rounds, ICANN continues to listen, analyze and incorporate constructive Community feedback into this version of the Applicant Guidebook as one of the implementation steps towards launch.

- ICANN has worked hard to resolve any remaining outstanding issues and move forward with the program.

- We understand that there is a demand for the program to launch as there are opportunities for promoting competition, consumer choice, and innovation.

- While not perfect, the Applicant Guidebook is on its way to being robust enough to support the launch of the new gTLD application process

Summary of Comments

Support for current version of guidebook.

The ICANN Board should keep its commitment to a 20 June 2011 vote to preserve the legitimacy of the consensus-driven policy making program. We look forward to final acceptance of the AGB and launch of the new gTLD program. The AGB has evolved into a program that fully protects rights yet retains objective standards for launching new gTLDs. The potential public benefit of new TLDs has already been demonstrated by the success of the IDN Russian TLD and the recent re-launch of the .co ccTLD. The public is hungry for more domain options

30 May 2011
and the new gTLD program answers that need while strongly protecting consumers, trademarks, and governments from bad actors. The AGB provides more protections than any other policy put into practice up to this point. Trademark holders and consumers will benefit from at least ten new protection policies that are not in place in current TLDs. Minds + Machines (15 May 2011).

The AG should be approved by the ICANN Board and the communications program should start at the ICANN Singapore meeting. Innovation will result from the new gTLD program. The protections in the AG far exceed those in the existing gTLDs. Either new gTLDs will create a massive benefit which will far outweigh any harms, or we need not worry about protections. The GAC role inside of ICANN is important and should evolve separately from and not be driven by the new gTLD process. The adoption of the AG should not be contingent on “finalizing” the role of the GAC, nor should it be impacted by narrow interests lobbying national governments. The AG, hopefully approved in Singapore, is simply doing what should have been done in 1999 and what would have been done if ICANN had then been in a stronger position. It is a natural step that is twelve years too late but better late than never. Tucows (15 May 2011).

We look forward to the release of the final AG on 20 June in Singapore. With regard to the latest attempts to delay the new gTLD process further based on claims that new gTLDs introduction should not be done “in a rush,” ICANN’s bottom-up multi-stakeholder model has provided over the past six years there have been thousands of opportunities for all parties to comment and participate. The nature of the bottom-up model is a compromise which naturally cannot meet everyone’s wishes. DOTZON (15 May 2011).

It is time to bring the process of establishing the rules for new gTLDs to a close and commence with the opening of the application period, with additional revisions to new gTLD policy being made in the future based on actual experience rather than overhyped projections. Any continuation of this process is only likely to provide additional time for the GAC to pursue its ill-considered goal of eroding registrant rights on behalf of large corporate trademark interests. ICA (15 May 2011).

“Cause-based TLDs”. Some new initiatives have designed business plans with the primary purpose of benefiting the greater and global public good—i.e., “cause-based TLDs” —which can offer benefits useful to people around the world regardless of how or if they use the internet. Time is crucial for some of these, so ICANN’s Board and the GAC are urged to avoid further delays and allow TLD innovation and the benefits of cause-based TLDs to commence by approving a 2011 application window for new TLDs and consider shortening the application window to 30 days. DotGreen (15 May 2011).

**Opposition to New gTLD Program**

**Key Points**

- There are inherent risks to the program whether ICANN limits the amount of gTLDs available per round or not. Were ICANN to go ahead with limiting the number of gTLDs in a round, it could potentially still introduce new levels of risk and simultaneously lose the anticipated benefits of new gTLDs.
Summary of Comments

The new gTLD program should be stopped—the internet society is not interested in it. ICANN has not presented evidence and convincing arguments to support the idea of introducing the new gTLD program. The internet society (legitimate owners of the internet—private users and companies owning domain names) is not interested in the new gTLD program. They are not given reasonable representation in the decision boards, so ICANN can get away with not presenting evidence to support introducing the new gTLD program. Comments and concerns, especially regarding the protection of trademark rights, are not taken into account by ICANN. Brand owners will have to fight for exactly the same domain names with the new proposed program as they are with the present system, but with much more money involved. There is nothing to be gained from the perspective of the internet users. Those who will earn money from this new, very expensive program (registrars and ICANN itself) are the ones who are interested in it. The process of introducing this expensive new gTLD program should be stopped immediately and only considered again once ICANN has produced convincing documentation that the internet society is interested in this program. The present, well-functioning and low cost set up for the internet secures freedom of speech for the many. The new gTLD program has very high costs and could evolve into a limitation of the freedom of speech for the many. H. Lundbeck (4 May 2011).

It is time for ICANN to go back to first principles and reboot the new TLD program in its entirety. ICANN is rushing to implement a plan that is not supported by the public. ICANN's policies do not maximize consumer welfare but rather raise consumer costs. The DOC, NTIA, DOJ and GAC should compel ICANN to go back to the drawing board. In the alternative, if ICANN does not demonstrate a willingness to do so, it is time to end the ICANN “experiment,” end the outsourcing of TLD management to ICANN, and instead restore management of TLDs to the DOC/NTIA. G. Kirikos (15 May 2011).

ICANN should reconsider overarching issues before any new gTLDs are released. Until the overarching issues are satisfactorily and comprehensively addressed, it is premature to proceed with the launch of the new gTLD proposal. The stated objectives of the work on new gTLDs still do not seem to be achieved with the applicant guidebook. ICANN has not shown that the new gTLDs will bring innovation, consumer choice and lower prices or that they serve any public interest. ICANN has definitely not shown that with new gTLDs “the need for brand protection and the opportunity for user confusion will be greatly diminished” (p. 2, ICANN Feb. 21, 2011, Public Comment Summary). Quite the opposite seems to be the realistic outcome of the release of the new gTLDs. LEGO (Module 5, 12 May 2011). Arla Foods (13 May 2011). Adobe Systems (13 May 2011). CADNA (13 May 2011). IACC (15 May 2011).

No compelling economic need. ICANN’s own economic studies indicate that there is no compelling economic need to introduce new gTLDs and that the current gTLD structure adequately accommodates Internet users’ current and forecasted needs. AIPLA (13 May 2011). Partridge (14 May 2011). INTA (14 May 2011).

New gTLD program—getting it right.
ICANN must get the new gTLDs launch right. The success of the multistakeholder model depends on it. In recent months tremendous progress has been made on the applicant guidebook. ICANN should approve an AG only when the community supports it. We remain willing and available to provide input. *News Corporation (13 May 2011).*

ICANN should continue to refine the new gTLD program with the goal of getting it right, not just getting it done, even if it takes beyond June 20, 2011, to do so. *Time Warner (14 May 2011). Microsoft (15 May 2011).*

**Limited launch--Pilot Program.**
A wide-open new gTLDs program should not proceed until mechanisms to address IP protection and other concerns are fully developed and tested. These issues need to be addressed before the business and intellectual property community can support ICANN's new gTLD plan. If ICANN believes that further delays are unacceptable then it should proceed with a small pilot program as previously suggested by the GAC for a strictly limited number of gTLDs designed to serve linguistic, geographical, and cultural communities. The pilot could provide actual data that could be used to refine and improve the application rules for subsequent rounds. The lack of economic need for new gTLDs demonstrates that there is adequate time to test new gTLDs through a pilot program. *AIPLA (13 May 2011). Partridge (14 May 2011). Coca-Cola (15 May 2011). Hogan Lovells (15 May 2011).*

We are perplexed by ICANN not following the advice of its own economic studies and the GAC to do a pilot program (a limited launch) of new gTLDs. A detailed explanation for this rationale would be appreciated. *News Corporation (13 May 2011). INTA (14 May 2011).*

ICANN has a critical overall task of appropriately narrowing the focus of the entire new gTLD project. ICANN's refusal to re-orient the scope, pace and targeting of the new gTLD launch is profoundly disappointing and casts serious doubt on ICANN's claim to be acting in the public interest and in conformance with a consensus of stakeholders. COA urges ICANN to grasp what may be the last opportunity to re-focus the new gTLD launch on the types of applications that offer the greatest potential benefits for the public, while minimizing the costs imposed on third parties. Some proposed new gTLDs may be targeted toward enhancing the Internet experience for “the next billion Internet users,” whose everyday languages are written in non-Latin scripts, or toward fulfilling clearly specified needs of limited and well-defined communities; others will add little but confusion and noise to an already chaotic online environment. As ICANN must realize by now, unless it relaxes its insistence on welcoming all these new gTLD applications without distinction, it will do nothing but buttress the position of those clamoring to call the ICANN experiment a failure and to move to an entirely different method of managing the Domain Name System. ICANN must not adhere obsessively to the arbitrary deadline set by the Board to take final action on the applicant guidebook by 20 June. ICANN must take the additional time needed to re-orient this exceptionally important initiative into a more targeted, better focused and more incremental approach. *COA (15 May 2011). SIIA (15 May 2011).*

The IPC joins with the GAC in urging ICANN to: (1) authorize only a discrete and limited number of new gTLDs; (2) undertake with respect to each application an evaluation of the social benefits and costs of each new gTLD application and to implement mechanisms for the denial of the application if such benefits are not clearly weighted in favor of consumer protection; and (3) implement data reporting for all approved new gTLDs on the subjects of malicious conduct, cyber squatting and other RPMs to assist ICANN in evaluating social costs of the new gTLD program. *IPC (15 May 2011). MarkMonitor (16 May 2011).*
DIFO is skeptical about the idea that 1,000 (or less) new TLDs will benefit the global Internet Society and would have been more confident if the new TLD introduction were limited to 50 new TLDs. **DIFO (15 May 2011).**

The new gTLD program threatens brand integrity with attendant financial impact for brand owners and poses significant risk of consumer detriment. ICANN should not proceed with a full-scale new gTLD program until these issues have been properly addressed. **BBC (Module 5, 13 May 2011). Adobe Systems (13 May 2011). CADNA (13 May 2011). INTA (14 May 2011). MARQUES/ECTA (15 May 2011). Coca-Cola (15 May 2011). NCTA (Module 2, 13 May 2011).**

**Risks to ICANN with unlimited rollout.** ICANN cannot avail itself of a “safe harbor.” If registries begin to fail, they will likely take more risks to stay afloat, including turning a blind eye to fraud and malicious conduct on a massive scale. Without significant compliance and enforcement monitoring, ICANN may unwittingly be subject to liability for acts of fraud or malicious conduct it should have been aware of and which were allowed to continue. ICANN’s future will be tied to the success and failure of future registries. A large number of such failures could impact its global reputation as a trusted custodian of the Internet. **MarkMonitor (16 May 2011).**

**Analysis of Comments**

Throughout the development of the new gTLD program and the Applicant Guidebook, there have been discussions about limiting the number of new gTLDs in the first round and/or adding categories (i.e., beyond open and community such as brand). It is possible that such measures could mitigate some risks with new gTLDs; however, they may also introduce new and unpredictable risks, i.e., abuses. Additionally, curtailing the introduction to certain categories of TLDs will severely limit the anticipated benefits of new TLDs: innovation, choice and competition. The full discussion of these issues has taken place under separate cover, in previous comment summaries and in public meetings. Finally, while the round is not limited by category, it is limited by rounds. The GNSO policy stated that the introduction of new TLDs should take place in rounds until well tested. The round is limited by the number of applications received during the limited open window. While a second round is planned, several assessments will be done prior to the launch. So the launch is not unlimited. Rather, it is limited in a way that takes advantage of lessons learned in previous rounds, provides protections, and provides the best chance of achieving the anticipated benefits. For these reasons, the process remains as it is today, limited.

**ICANN continues to execute on its mission and the bottom-up, multi-stakeholder model has provided an opportunity for all parties to participate and comment.** The recent, intensive involvement of governments is one example of this collaboration, along with the extensive public comment rounds for the evolution of the Applicant Guidebook.

**Based on the principles embodied in ICANN’s founding documents, it is believed that the expansion of the generic top-level domain (gTLD) space will allow for a greater degree of innovation and choice.**

Implementation of this program is a complex and involved process that has required the coordination and consensus of many groups and factions.

30 May 2011
While not perfect, the Applicant Guidebook is on its way to being robust enough to support the launch of the new gTLD application process and ICANN is committed to diligently working towards consensus on implementation and operational solutions.

ICANN PROCEDURES

Key Points

- ICANN’s Governmental Advisory Committee has reiterated its intent to follow its Operational Procedures and the GAC will advise the ICANN Board on both consensus concerns and the concerns of several members as required.

- The gTLD program will remain flexible to implement changes as needed to improve the program and address community concerns on a timely basis going forward. A process to identify, prioritize, and implement necessary changes is being built into the program.

Summary of Comments

Explicit definition of “GAC Consensus” needed. The current applicant guidebook makes reference to “GAC consensus” and its ramifications for a new gTLD application. We do not see a definition for “GAC consensus” in the guidebook; this term needs to be promptly and explicitly defined. We are not confident that the ICANN community’s concept and application of “consensus” matches that of the GAC. Any misunderstanding on this point will be detrimental to the new gTLD process, to potential applicants and to ICANN in general. Network Solutions (12 May 2011).

GAC-ICANN negotiations. Asociacion Puntogal is comfortable with all the points that already have been agreed to in the GAC-Board negotiations to improve the applicant guidebook. Improvements made in response to GAC advice such as early warning and trademark protection measures will help achieve a more robust process. These changes are easy to implement by truly community-based cultural and linguistic TLDs or other solid and non-controversial initiatives. Asociacion Puntogal urges the Board and the GAC to find an agreement where possible on the remaining points. Asociacion Puntogal (13 May 2011).

It is perhaps disappointing that it has taken a strong intervention by the GAC to ensure that the concerns of IP rights holders have been taken into account in the new gTLD program, especially when one considers the levels of participation in the public comment periods to date. Thus many do question whether commenting in such a forum is an efficient means to put forward constructive comments. Hogan Lovells (15 May 2011).

U.S. government restrictions. It is worrying that a new TLD applicant may not be considered due to a restriction imposed by the U.S. government (i.e. OFAC) and this could be seen as a weakness of ICANN’s links to the U.S. M. Neylon (15 May 2011).

New gTLD Program—Ongoing Reviews.
We support the logical decision of ICANN to collect data from each launch and review systems such as the URS after a year to improve policy and procedure. *News Corporation (13 May 2011).*

ICANN must remain flexible to future amendments as the community identifies problems during the launch of the first round of new gTLDs. ICANN should establish more concrete plans for evaluating the launch of new gTLDs and rapidly implementing modifications and enhancements to address any problems that arise. *USCIB (15 May 2011).*

**Analysis of Comments**

A comment requests that GAC consensus have an explicit definition in the Guidebook to avoid potential issues with varying definitions by the GAC and the ICANN community. The GAC has stated that, “the GAC will clarify the basis on which consensus advice is developed.” In its “GAC comments on the ICANN Board’s response to the GAC Scorecard” dated 12 April 2011 (see [http://gac.icann.org/press-release/gac-comments-board-reponse-gac-scorecard-following-san-francisco-meetin](http://gac.icann.org/press-release/gac-comments-board-reponse-gac-scorecard-following-san-francisco-meetin)) the GAC maintains its “intention to follow its Operating Procedures when developing advice for the Board’s consideration related to objections raised by its membership.” The GAC will advise the ICANN Board on both consensus concerns and the concerns of several members as required. The GAC has expressed the intention to develop a vocabulary for use in its advice so that the meaning is clear and can be consistently understood by all parties.

A comment expresses concern about certain legal restrictions imposed by the U.S. government on ICANN (i.e., the Office of Foreign Asset Control (OFAC) requirements). The intention with inclusion of this section in the Guidebook is to be transparent about this aspect of ICANN’s current legal structure and obligations. ICANN considers it important to disclose this information to prospective applicants, as well as to detail what steps ICANN takes in handling such cases (e.g., seeking and obtaining licenses).

A few comments suggest that the gTLD program should remain flexible and establish more concrete plans to timely implement improvements or address problems identified by the community. We agree and this is already part of the gTLD program. ICANN is working to identify critical success factors and will implement a process to identify, prioritize, and implement improvements to the program based on these factors as well as lessons learned from various sources including the applicant and general community.

**TIMELINE/MODELS**

**Key Points**

- There is a plan to announce a final timeline, with appropriate caveats, once the Applicant Guidebook is approved.

**Summary of Comments**

Reliable timeline needed.
A reliable timeline is the only way to restore the credibility of the process. The vote scheduled is especially relevant for the viability of cultural and linguistic TLD applicants who will foster cultural diversity on the Internet. Any further delays will harm their cause. The more than 12,000 Internet users and 100 cultural organizations that have already signed up to support Asociacion Puntogal help to demonstrate that there is a real social and economic need for new gTLDs. Asociacion Puntogal (13 May 2011).

What prospective applicants now need, above all, is the final timeline. AFNIC (15 May 2011).

Date certain for subsequent rounds. To avoid numerous panic applicants (concerned about the risk of not applying and about a possible lengthy gap between application rounds) a date certain should be announced for the subsequent new gTLD application round. It should not be later than one year after the first round. It is no problem if there is overlap between the first and the subsequent round. The correct time to start evaluation is immediately at the moment when all strings are published. The evaluation of the first round will be meaningless if it was dominated by “panic applicants.” ICANN should therefore announce opening of the coming 60-day TLD application period on a set day in November 2011, and announce at the same time that the subsequent round will open on a set date in November 2012. W. Staub (15 May 2011).

Analysis of Comments

Comments request that a definitive timeline be provided for the initial application round as well for a subsequent round. The former will help applicants with planning and the latter would help mitigate the risk that some set of applicants will simply apply to avoid the uncertainty of when the next round will launch.

The plan following the approval of the Applicant Guidebook is to announce a final timeline that is expected to cover all aspects of the application program (e.g., communication campaign, the launch date, initial evaluation). The timeline will include all appropriate dependencies. The timing of subsequent application rounds will be determined based on these factors as well as experiences gained and changes required after the initial round is completed.

COMMUNICATIONS

Key Points

- ICANN is planning a global communications campaign that will incorporate outreach activities in the five ICANN regions, including targeted outreach to developing countries.

- As part of the communications campaign, ICANN plans to continue to publish critical program documentation into the six UN languages – Arabic, Chinese, English, French, Russian and Spanish.

- The communications campaign will highlight specific areas of the program, such as timelines for submission of applications, the evaluation process, the objection process, and rights protection mechanisms.
Summary of Comments

Effective communications and outreach activities are essential to the success of gTLD expansion. ICANN’s communications effort must do more than simply promote new gTLD applications. It must also fully inform user and business communities around the world of all the major changes coming with the introduction of new gTLDs. BC (15 May 2011).

Global awareness and understanding of new gTLD program. Geographic name strings raise concern given that many countries (especially developing nations) will not know when to object to them (e.g., early termination). Governments will likely end up having to go to a U.S. court and pay for associated costs, which will only make the U.S. more rich. Indonesia, in particular, has more than 200 million people, and faces a challenge in understanding all the details of the new gTLD program and the DAG (i.e. translation issue). Also, why must all parties bow to U.S. law and use a U.S. court? Why not use PNG’s laws and courts, or have Indonesia host all the domain cases? Regarding the GAC’s proposal to ICANN that it translate the DAG into languages for places where there are large numbers of Internet users, what about PNG, Timor Last, Fiji, and Palau, which do not use English as the mother tongue—does ICANN never count people who live there as internet users? This raises doubt about ICANN’s vision to make one world, one connection. ICANN does not seem to have significant efforts to socialize the DAG all over the world and the ICANN website is not well-known. Most countries still do not understand or do not even know about the DAG. D. Elfrida (6 May 2011).

Publicizing Rights Protection Mechanisms (RPMs). It is incumbent on ICANN to publicize the RPMs as fully as it publicizes the overall gTLD program in the four month period between approval of the guidebook and the opening of the first window for new gTLD applications. Also, so that the public can timely determine whether to seek such protection and how to do it, ICANN needs to make available on a continuing basis into the future literature that clearly advises the general public of the existence of these RPMs and how to access and use them. IBM (13 May 2011).

Analysis of Comments

The goal of the planned communications campaign is to increase global awareness of the new gTLD program. This campaign will raise awareness among interested parties and applicants worldwide on the who, what, when, where and why of new gTLDs. It will address a range of audiences. The goal is to educate so that interested parties are aware of the program details and things they need to consider, whether applying for a new gTLD or not.

As part of the communications effort, ICANN translates the Applicant Guidebook into the six UN languages. Other critical material relating to the program such as the Objection Process and Rights Protection mechanisms will be adequately communicated and translated as well.

As part of our communications efforts we intend to reach as many people as possible through global outreach in each of ICANN’s five regions – Africa, Asia (including the Middle East), Europe, Latin America, and North America. These outreach efforts will include informative sessions, new conferences, speeches and targeted media interviews to gain the furthest reach possible. The education process will include helping people understand both the opportunities and risks associated with applying for a new TLD as well as how this program will ultimately change the Internet.

30 May 2011
We have and will continue to publish critical program documents in the six UN languages – Arabic, Chinese, English, French, Russian, and Spanish. Interested parties will always be provided with ways of obtaining more information either from our website or through a dedicated email address.

It is agreed that critical elements of the program such as the Objection Process and Rights Protection Mechanisms be adequately communicated so people are well informed about when and how to object and the steps they can take should they determine whether and how to seek such protections. As part of the communications plan we will call out these areas to make them more accessible to those seeking such information.

APPLICATION PROCESS

Key Points

- Further details on the GAC Early Warning and Advice processes are requested for applicants to understand potential impact and allow for appropriate action as necessary. Additional detail is provided here and in the Guidebook; and we will work to provide additional details and answers to clarifying questions.

- Clarification on a number of questions regarding the application process is being provided in the updated Guidebook. In addition, a robust customer service process will be implemented to help applicants with specific questions during the application process.

- While it is virtually impossible to ensure no “bad actors” secure a Top-Level Domain, additional protective measures have been put in place such as an expanded background screening and a GAC Early Warning process. (See Malicious Conduct summary for more details.)

Summary of Comments

Support for GAC changes made by ICANN. UNINETT Norid is pleased that ICANN has listened to the Governmental Advisory Committee and included paragraphs on Early Warning in 1.1.2.4 and Receipt of GAC Advice on New gTLDs in 1.1.2.7. These changes will reduce possible conflicts and objections later on and minimize the costs for all parties. UNINETT Norid (Module 1, 11 May 2011). DIFO (15 May 2011).

GAC Early Warning.

CADNA is pleased with the GAC Early Warning addition to the Guidebook. This could be improved upon with stronger wording, forcing the ICANN Board to take a warning into consideration instead of being able to entirely disregard it. Governments should have more and stronger ways of raising formal complaints about a TLD application, of course without the ability to abuse the system. CADNA (13 May 2011).

Regarding 1.1.2.4 Early Warning, it is very important that the Early Warning Notice to the applicant be accompanied by the reason for the warning and that it identify the objecting countries with applicable points of contact; otherwise it will be difficult for the applicant to try to mitigate the concerns and/or make a timely decision about withdrawing the application. RySG (15 May 2011).
**GAC Advice.** CADNA is encouraged by the addition of GAC Advice which enables the GAC to provide public policy advice directly to the ICANN Board for consideration on any application, although this provision should be more strongly worded (e.g., it is unclear what is meant by the phrase that the Board must “strongly” consider GAC advice when deciding whether to approve an application). A measure should be put in place to show how GAC advice will be taken into account and the reasons for which the Board decides to disregard it and proceed with approving the application. *CADNA (13 May 2011).*

**GAC guidelines for Early Warning and Advice.** ICANN should clarify the guidelines which the GAC will refer to when making GAC Early Warnings and GAC Advice. The current explanation does not make it clear as to what kind of issues would cause a string to be considered questionable or sensitive. At the moment it seems that almost anything falls into the scope of GAC decision making. *Brights Consulting (14 May 2011).*

**Eligibility – restrictions.** CADNA applauds the detail added to applicant eligibility provisions. Conducting more thorough background checks and placing tougher restrictions on eligibility will hopefully ensure that there are fewer opportunities for applicants with bad intentions to proceed and that only those applicants who should be applying for new gTLDs make it through the process. *CADNA (13 May 2011).*

**Dot Brand Applicants.**

It will greatly benefit potential dot brand applicants if a separate application category were created for them (dot brand model is mentioned in the Registry Code of Conduct) or alternatively if such a model were to be identified in the main body of the applicant guidebook. *Brights Consulting (14 May 2011).*

It is disappointing that there is not a specific dot brand category available for essentially what may be closed or defensive registries. There should be a separate dot brand category defined and more clarification as to how businesses applying for a dot brand should structure their application. *Hogan Lovells (15 May 2011).*

Applicants for a dot brand TLD need more details in the final AGB for planning reliability on costs, requirements and processes. So far only a few details are included in the AGB like in the Registry Code of Conduct. *DOTZON (15 May 2011).*

**Regulated and professional sector gTLDs.** It is not just geographical designations that are sensitive in nature and in need of special protections. Special care should also be given to regulated sectors (e.g. financial) and professions as the potential for damage and harm to society is high (financial harm and loss of trust in e-commerce and the internet at large). ICANN must mitigate the risks of sensitive strings being controlled or operated through rules and safeguards and the applicant guidebook should not be approved without their inclusion:

1. Applicants for a regulated profession, industry or sector (e.g. .bank, .insurance) should be required to submit a written endorsement of their application by the relevant supervisory bodies or authorities (analogous to the government support requirement for geographical names) or a valid and in-force license to operate such a business, and such applications should not be admitted to delegation absent such endorsement or valid license.

2. Analogous to community-based applications, regulated sector applications should also be subject to certain post-delegation contractual obligations to operate the gTLD
in a manner consistent with the restrictions associated with this regulated sector designation and to take adequate measures to avoid consumer confusion and harm, including but not limited to the obligation to take action against a second level domain registrant, or suspend such registration(s) or service(s) upon intervention or complaint by a competent national regulatory or supervisory body.

(3) As proposed by the GAC, the application evaluation process should include review by governments, via the GAC explicitly also for applications relating to sectors that are subject to national regulation (i.e., GAC Early Warning and GAC Advice should be applied to such applications). Intervention by a competent supervisory authority via the GAC would create a strong presumption for the ICANN Board that the subject application should not be approved.

(4) The Limited Public Interest Objections should explicitly include objections based on national regulations for the protection of consumers and sector specific national regulations that are also intended as consumer protections.

Swiss Re (15 May 2011).

Updated timelines. ICANN should clarify the application process by providing a diagram with the updated timelines for each portion of the process. As of now there are some places that have confusing information. Brights Consulting (14 May 2011).

Section 1.1: ICANN should take into account external holiday calendar events as well as the timing of ICANN meetings, and adjust accordingly the Application Program timeline. RySG (15 May 2011).

Batching. ICANN should provide details in the final AG on the batching process. Details are not yet available, apart from basic information that a separate process still has to be established. DOTZON (15 May 2011). RySG (15 May 2011). AFNIC (15 May 2011).

The first batch should be significantly less than 500 applications in order to test the operational readiness of newly designed application processing and objection/contention systems. A significant portion of the first batch should be comprised of Community-Based applications. Subsequent application rounds should be launched as quickly as possible but only after ICANN adjusts the application process and guidebook to reflect experience learned in the initial round. BC (15 May 2011).

Fee reductions/packaged pricing for IDNs and other languages.

Applicants should be granted fee reductions for additional versions of the applied-for string in IDN scripts and other languages. This would serve as an incentive mechanism for build-out of IDNs and underserved language-script communities. If the applicant is seeking new translations of a current gTLD, then all registrants should have the option to register their second level names in all of the linguistic variations offered by that TLD. BC (15 May 2011).

The ICANN Board and staff should work with the community to provide an approach that enables applicants to offer multiple (“bundled”) applications that include different script versions of the same string at a lower, packaged price. Packaged pricing fits ICANN’s values by, among other things, promoting diversity; makes budget sense; and would stay within ICANN’s cost neutrality guidelines. Packaged review of related applications will lower ICANN’s review costs and lower the costs to applicants—leading to more IDN build out around the world. R. Andruff et al. (15 May 2011). C. Roussos (16 May 2011).
Not-for-profit pricing option (1.5.1). ICANN should provide a not-for-profit new gTLD applicant pricing option which could only be available to a subset of not-for-profits based on criteria. 
NPOC (16 May 2011).

Legal compliance (module 1, p.23). Regarding the requirement that “ICANN must comply with all U.S. laws, regulations and rules, and prohibits offering license to the individual or entity of the U.S. Treasury SDN list,” this provision is inconsistent with ICANN’s multi-stakeholder model and bottom-up process, which makes it difficult for ICANN to be open, fair and equitable to other governments and other stakeholders. ICANN should bear in mind the development and application characteristics and trends of the Internet, having full consideration of the interests of all stakeholders and making appropriate amendments to the provisions. Internet Society of China (27 May 2011).

Background screening (1.2.1). Background screening should occur at the level of the entity, named individuals, and entity affiliates and subsidiaries. When the ICANN Board eliminated any restrictions on cross ownership or vertical integration, it increased the importance of screening applicants for prior abusive conduct. Cyber squatting has been documented at affiliates and subsidiaries of the registrars and registries who are likely to be applicants for new gTLDs. ICANN should expand disqualification criteria to apply to affiliates or subsidiaries of the applicant entity. BC (15 May 2011).

Modify the “three strikes” UDRP reference for applicant disqualification. This criteria should be adjusted to take into account the size of an applicant’s domain portfolio as well as the percentage of adverse UDRP decisions rendered against them in comparison to all UDRP proceedings they have been involved with. If unchanged, ICA intends to carefully monitor the actual enforcement of this disqualification criteria for both companies and individuals and suspects that ICANN will exercise a significant degree of enforcement flexibility based upon the “exceptional circumstances” and “generally be considered” phrases in the current proposed language, rather than bar applications for new gTLDs submitted by large registrars. Any flexibility in applying this criteria should be accorded equally to both corporate and individual new gTLD applications. Individual owners of large domain portfolios, unlike corporations, cannot establish subsidiaries or affiliates of themselves, yet may otherwise be in the same position as regards their UDRP histories. ICA (15 May 2011).

A hard and fast line—whether an entity or person has lost 3 or more UDRP cases—is not appropriate and will unintentionally disqualify otherwise qualified applicants. Further, the language is not clear on what constitutes cyber squatting. ICANN should revert to the DAGv4 definition of “bad faith in regard to domain name registration” and in conjunction with this definition use a definition of history or pattern of cyber squatting that does not involve a specific number but rather is closer to a “customary way of operation or behavior” and thus allows for a contextual analysis for each applicant. Demand Media (15 May 2011).

“Adverse, final” in revised Sec. 1.2.1.m. New language in this section referencing “adverse, final” decisions appears to be responsive to ICA’s December 2010 comments that a UDRP loss that has been reversed on appeal should not count against an applicant and ICA thanks ICANN for that adjustment. ICA (15 May 2011).

Reverse Domain Name Hijacking (RDNH)—Equivalent Treatment. New language in Section 1.2.1m that disqualifies entities who have engaged in RDNH under the UDRP or bad faith or reckless disregard under the ACPA or equivalent legislation is responsive to ICA’s December
2010 comment seeking equivalent treatment and ICA thanks ICANN for that adjustment. *ICA (15 May 2011).*

Sec. 1.1.2.3: Where clarification is sought from the applicant because consideration of the comments has impacted the scoring of the application, how will the clarification sought by the evaluators and the clarification provided be recorded and made public? This should be explained. *RySG (15 May 2011).*

Sec. 1.2.8: This section is entitled Voluntary Designation for High Security Zones. Considering the final report of the High Security Zone TLD Advisory Group, shouldn’t this section be deleted? *RySG (15 May 2011).*

Answer length requirements. Where there are requirements for numbers of pages per answer (applies to a number of the 50 questions), ICANN should provide details regarding the necessary font size, page size and spacing between lines (correspondent with those used in TAS), or alternatively ICANN should set the length of the answers by number of words or characters. *Brights Consulting (14 May 2011).*

More TAS information. Once the AG is approved by the ICANN Board at the 20 June 2011 meeting, it would be useful to have more information about the TAS and how it will work. A demo version or Operational Testing Environment (OTE) of the TAS should be made available as soon as possible. *AusRegistry (16 May 2011).*

**Analysis of Comments**

Several comments express their appreciation and support for incorporating GAC Early Warning and Advice processes and a more comprehensive background screening check into the gTLD program.

A number of comments also request more details about the GAC Early Warning and Advice processes, such as clarification/guidance on what might raise an issue or concern, requiring that the GAC provide specific details in their Early Warnings to enable Applicants to take timely and appropriate action, and a clear process for how the Board will consider GAC Early Warnings and GAC Advice.

Note that the purpose of the Early Warning process is to provide GAC members with an opportunity to raise concerns directly with the applicant over their string(s) and/or their application(s) early in the process. While definitive guidance has not been issued, the GAC Scorecard indicated that strings that could raise concerns include those that “purport to represent or that embody a particular group of people or interests based on historical, cultural or social components of identity, such as nationality, race or ethnicity, religion, belief, culture or particular social origin or group, political opinion, membership of a national minority, disability, age, and/or a language or linguistic group (non exhaustive)” and “those strings that refer to particular sectors, such as those subject to national regulation (such as .bank, .pharmacy) or those that describe or are targeted to a population or industry that is vulnerable to online fraud or abuse.”

In the case of an Early Warning, the GAC has been requested to provide the reasons for the Early Warning and to identify the countries raising the concern in order to best inform applicants so that the applicants can make informed decisions.
Existing processes for how the Board considers GAC Advice have not changed, although the Board may now consider Early Warnings provided to the applicant as part of its review of GAC Advice received later.

A few comments continue to request the creation of a dotBrand category. While we have discussed the concerns with introducing categories in response to previous comments, the central issue appears to focus on how certain applicants can meet the requirements to secure a gTLD given their unique registry/business model. For example, an applicant might secure a TLD with the intent of having a “closed” or internal facing registry (i.e., having no intent of allowing the general public to register domains). It should be noted that the pre-establishment of special requirements in the application for such TLDs would likely not meet all possible circumstances, “dotBrand” TLDs mean different things to different parties, and does not cover the possibility that the applicant’s intended registration approach may change, especially in those cases where the applicant has not designated itself as a community-based TLD.

The application form is designed to allow evaluation of the necessary financial, technical, and operational components of the applicant’s plans. We do understand that additional guidance may be necessary for applicants in particular cases in relation to particular questions while progressing through the application process. Accordingly, we will continue to provide necessary updates and guidance on submitting an application and will implement a robust customer service program to provide clarification where necessary.

Another comment highlights the concerns associated with certain strings that may be deemed sensitive by various parties and requests that regulated sectors and professions should be given special care to minimize the potential harm and damage to the public. As discussed in response to previous comments, there are issues with introducing a new category of strings. For “sensitive” strings, there is no general agreement on what qualifies as a “sensitive” string nor has a definitive and agreed on list of such strings been provided. Concerns about particular strings may be addressed via the independent objection and dispute resolution process, or through the GAC Early Warning and GAC Advice processes.

Further comments request that background screening scope be expanded to include affiliates, subsidiaries, and other entities that have relationships with the applying entity. These comments presumably focus on preventing “bad actors” from securing certain Top-Level Domains. The potential benefits of expanding the scope of background screening for all applicants must be weighed against the costs for processing all applications and increased costs incurred in performing background screening on an extended chain of related entities. ICANN has discussed and considered the process suggested to screen applicant affiliates as well as applicants themselves. Such a step would introduce significant complications and costs to the background screening process without a balancing benefit. For example, in addition to ICANN screening the affiliate, it would also need to do so for the directors, officers, partners, etc. of the affiliate. This additional screening is cost and time prohibitive and would probably not result in many disqualifications given the level of scrutiny the applicant is subject to under the process. Affiliates are often distant and have no role in operation or conduct of a TLD to be operated by the applicant. Also, such an inquiry would lead applicants to set up new entities to provide separation between themselves and affiliates. This would not be just to mask prior bad conduct – it could simply be to avoid the expense and intrusion of background checks into their associates who will not play a role in the process.

However, while it is nearly impossible to ensure no "bad actors" secure a new Top Level
Domain ICANN has implemented several protective measures to minimize this risk. Those measures include:

- Expanding the scope of the background screening check to include additional crimes as suggested by the GAC. This also includes obtaining input from law enforcement representatives on the selection of a background screening service provider.

- Adding language to the Registry Agreement that requires Registry Operators to take reasonable steps and respond to any reports (including from law enforcement and governmental consumer protection agencies) of illegal conduct utilizing the Registry TLD. Failing to comply with this provision could lead to termination of the Registry Agreement.

- Making public the names and titles of key officers, directors, partners and controlling shareholders of each applicant to enable comment.

- Providing a GAC Early Warning process that allows members of the GAC or any individual government through the GAC to provide a notice to certain applicants.

Comments request clarity on timelines and consideration given to holidays and other meetings. Holiday periods in the various regions of the world are being taken into account in considering the possible timelines involved in launch of the program.

Comments request additional information regarding the batching process, with some suggestions for placing a limit on the first batch to test operational readiness, and for ensuring that a significant portion of the first batch be comprised of community-based applications. Additional details regarding the batching process will be provided in the event the batching process must be implemented. This allows some flexibility in processing timelines. For example, if slightly over 500 applications are submitted then a decision to extend Initial Evaluation by some amount of time to accommodate all applications may occur so long as the maximum delegation rate limits are not impacted. Also, the batch limit is dictated by processing capacity, which is based on understanding the impact to operational readiness through the build and testing of those activities. So at this point, though the small first batch is a good idea, there will not be further test operational readiness after the launch of the program. Even if the smaller batching were done, allowing one type of applications to proceed over others may provide an unfair advantage over other applicants that may be promoting to a similar group of registrants.

Comments regarding fee reductions have been addressed in previous versions of the Guidebook. The evaluation fee is revenue neutral and is based on an estimate of the costs to process applications. As this will be the first round of processing applications, there are a significant number of uncertainties that must be accounted for. Accordingly, reducing fees under any circumstance is not envisioned in the initial round. However, ICANN will conduct an analysis at the end of the initial round to determine where efficiencies can be gained and savings passed on in future rounds.

A comment requests clarification on how comments will be considered by evaluation panels and clarifications sought from applicants. Any comment directly impacting the score of a specific applicant will require clarification from the applicant before a final score is provided. An applicant may choose to provide its response within the public comment forum. However, there is an opportunity for the panel to provide questions to the applicant and the applicant can then reply. The evaluation results are publicly available after the evaluation process has been completed.
A comment asks if Section 1.2.8 – Voluntary Designation for High Security Zones should be removed from the Guidebook. The Guidebook has been updated with regard to the working group’s final report, and indicates that ICANN will support independent efforts to develop a voluntary high-security TLD designation.

Comments request additional information on the TLD Application System (TAS) including clarification of answer length requirements. A plan is in place to release additional information on TAS in relation to look and feel. However, for security reasons, a test version of the tool will not be released for public use. Finally, additional guidance on application requirements (i.e., character limits for answers) will be provided in the next version of the Guidebook.

Comments expressed support for the clarifications concerning UDRP decisions and reverse domain name hijacking. Comments also called for greater flexibility in reviewing an applicant’s history of UDRP proceedings. It is important that there be an objective standard to avoid the additional cost and potential inconsistent results of an ad hoc review, and provide greater predictability for applicants. Previous comments on this section called for additional information on what would constitute a “pattern” of behavior, with the expectation that the standard should be generally available to applicants. An objective standard has been put in place. The standard of three or more decisions with one or more occurring in the last four years accounts for both a threshold of repeated behavior and a relevant span of time. The intent of this test is to prevent those who are likely to engage in cybersquatting from obtaining a TLD. This is why the standard provides discretion: the test is stated to be a “general rule,” which can be reconsidered if warranted by exceptional circumstances. A variety of factors might influence that decision.

Finally, there is a comment regarding ICANN compliance with US national law and how that might lead to actions working contrary to the multi-stakeholder model. ICANN has little choice but to comply with US law as that is where its headquarter is located. ICANN attempts to obtain licenses in order to serve requests wherever possible.

EVALUATION

Key Points

- Comments/questions focused on clarifying the application questionnaire should be sent to newgtld@icann.org. ICANN will capture and provide a central repository of responses for all applicants going forward.

- Metrics/criteria used to facilitate the weighing of potential benefits/costs should be 1) tangible, 2) transparent, and 3) measurable.

Summary of Comments

Applicant Review Process—Governmental Entities (Cities). The City of New York seeks to be treated the same as publicly traded corporations in the ICANN applicant review process (Guidebook, section 2.1.1 at 2-2, General business diligence and criminal history). Indicating that governmental entities subject to independent audit, GAAP compliance and public integrity controls will be treated similarly to private entities would encourage responsible governments to proceed with gTLD applications directly to ICANN. This will provide diversity and local
representation to the Internet framework, which is one of the goals of the new gTLD program. 
City of New York (13 May 2011).

Post Launch Compliance. ICANN should require post-launch compliance with the policies and procedures offered by applicants during the application period. Further, ICANN should impose and enforce such requirements with the registries for the existing TLDs. NCTA (Module 2, 13 May 2011).

Reserved names list—Olympic and Olympiad. The terms Olympic and Olympiad should be added to the Reserved Names list, which would be consistent with the laws of the U.S. and numerous other countries around the globe, and allow the U.S. Olympic Committee to focus its limited resources on its primary mission, rather than on defensive registrations and a cumbersome process of filing formal objections against infringing gTLD applications. The RPMs in the guidebook are insufficient to protect the Olympic movement. Both the USOC and the International Olympic Committee (IOC) have repeatedly advocated that reserving the words Olympic and Olympiad in the top and second levels of all new gTLDs serves the public interests of the international community and comports with accepted principles of law. As explained in detail in past comments submitted to ICANN, more than thirty nations have enacted sui generis legislation reserving exclusive use of the words Olympic and Olympiad to the IOC and the National Olympic Committees. More than sixty countries have signed the Nairobi Treaty on the Protection of the Olympic Symbol, establishing special protection for the Olympic Movement as an internationally accepted principle of law. The GAC has advised the ICANN Board to approve the request to add Olympic and Olympiad to the Reserved Names list. USOC (13 May 2011). IOC (15 May 2011).

Reserved names (2.2.1.2)—include ccTLD regional organizations. The names of ccTLD regional organizations must also be included on the reserved names list (e.g., CENT, APTLD, LACTLD, in the same status like LACNIC, ARIN, RIPE, Afrinic or APNIC). It is necessary to the community to feel and know that ICANN is also protecting the ccTLD communities. Note that this is the third time that this comment has been sent and that the four RO’s are observed in ccNSO and are part of ccNSO committees and are recognized by all the community. E. Iriarte Ahon (16 April 2011).

It would be helpful to understand why ICANN has not included the regional organizations for ccTLDs on the reserved names list (e.g. CENTR). M. Neylon (15 May 2011).

Reserved names—remove ICANN mark. Equity and fairness dictate that the ICANN Mark should be removed from the reserved names list. ICANN should bear the same burden and expense of protecting its mark against cyber squatters as other brand owners must. Microsoft (15 May 2011).

Two-character labels. The newly added reservation of “two-character labels” should be deleted from the applicant guidebook; it may cause problems and lacks a rationale. Confusion with the “two-letter codes” of ccTLDs or technical reasons are by all means not evident. Reservation of two-character labels has never been a publicly discussed point and putting it into the guidebook rules without a community discussion is outside the policy development process. Its timing is odd because at least a dozen gTLD and ccTLD registries have released “two-character labels” just recently or are planning to release them in the near future, with ICANN’s approval in the case of gTLDs. Reservation of two-character labels will create legal challenges in many new gTLDs (e.g. in Germany DENIC, the operator of the .de ccTLD was in 2010 forced by competition and

Single character IDN gTLDs.
Before it adopts any implementation models for single-character IDN gTLDs, ICANN must put those models out for a meaningful public comment period. Microsoft (15 May 2011).

Regarding 2.2.1.3.2, consistent with the original new gTLD Recommendations approved by the GNSO Council and the Board regarding Reserved Names and with the recent GNSO Council recommendation, the RySG strongly supports the JIG recommendation that single character IDN gTLDs be allowed as proposed by the JIG. RySG (15 May 2011)

Internet Society of China presented comments to ICANN on JIG single character international top-level domains on January 12, 2011, expressing its concerns about single character IDN gTLDs. Internet Society of China requests again that single character IDN TLDs be analyzed in regard to different languages on a case-by-case basis, and related policies should be considered after the IDN variant word policy solution comes out. Regarding Chinese characters, words composed of two or more characters usually have explicit meaning. But in some cases a single Chinese character has more than one meaning. Some Chinese characters represent geographical names (hereinafter referred to as or commonly known as), and the nation, the surname, etc. If these characters are used as domain names, it is easy to cause confusion and misunderstanding. Internet Society of China (27 May 2011).

CNNIC welcomes allowing IDN single-character TLDs into the market. The single Chinese character string often shares similar meaning with a two-character Chinese string, and some single Chinese characters are used by Chinese people as acronyms to refer to geographical names or other specific noun phrases. The guidebook might address it to avoid users’ confusion. Moreover, single Chinese characters also have variant issues. ICANN should comprehensively consider the IDN variants issue and single-character issue in the application guidebook. CNNIC (27 May 2011).

Chinese IDN variants—timetable concern. ICANN attaches great importance to the IDN variants issue and has instructed formation of the VIP WG to find a management mechanism; however, the timetable is unfavorable for IDN variant applicants if they want to apply for an IDN TLD in the first application round. The ICANN VIP group should expedite the process so that the variant issue can be properly addressed and the variant issue should be treated on a case-by-case basis and first-come-first serve basis to meet the demand of potential applicants. Based on registry operation experience, Chinese TLD operators have developed a concrete and feasible solution to meet the needs of Chinese users worldwide. Chinese solutions have been fully tested out by the delegation and operation of Chinese IDN ccTLDs. To date, registries have not received any complaints regarding variant management and no abuse of variant domain names is reported. The Chinese Domain Name Consortium produced a detailed report on the Chinese experience last year in its letter to ICANN. CNNIC believes that the work of the Chinese community will serve as a good foundation for the VIP WG. CNNIC (27 May 2011).

Data gathering.
USCIB is pleased to see that the AG now requires applicants to detail the expected benefits from their TLDs as well as how the TLD operating rules will minimize “social costs.” Gathering appropriate data is key to helping identify problems during the initial rollout. USCIB supports the Economic Study’s suggestion for ICANN to gather information in order to more clearly identify the general benefits and costs of implementing new gTLDs. USCIB also recognizes
ICANN’s commitment to this endeavor under Article 9.3 of the Affirmation of Commitments that requires ICANN to organize a review of the introduction or expansion of gTLDs and associated processes. **USCIB (15 May 2011). NCTA (Module 2, 13 May 2011).**

Any criteria or metrics created to facilitate weighing potential costs and benefits to the public in the evaluation and award of new gTLDs, as recommended by the GAC, should be tangible and transparent in order to evaluate the success of the program and help form recommendations for its continual improvement through future rounds and expansion. Specific applications should highlight the potential community costs and benefits of any new gTLD. Any such costs and benefits identified in an application should be: (1) measurable; (2) directly affect whether an application is approved or not; and (3) be used to hold registry operators accountable for the operation of the gTLD. **MarkMonitor (16 May 2011).**

NPOC supports the questions (2.2.2) regarding applicant intent as part of the application process and suggests that the Board consider scoring answers to those questions as part of the application review. **NPOC (16 May 2011).**

 Costs and benefits review criteria (2.2). The Board should incorporate review criteria for weighing the costs and benefits to the general public for all new gTLD applications. E.g., in the not-for-profit community there is concern about strings such as .DONATE, .CHARITY, .GIVE, etc. which offer tremendous opportunity for both good and harm. Such strings should be carefully considered during the application review process without requiring a costly objection to be filed first. **NPOC (16 May 2011).**

**Dot Brand Applicants.** The evaluation questions should take more account of the needs of dot brand applicants. E.g. question 18, which requires applicants to state the mission/purpose of their registry, has been significantly expanded in this draft of the AG with a series of sub-questions which are not directly applicable for dot brand applicants. The application process would be improved if alternatives were provided for dot brand applicants, asking about, e.g., how a new gTLD will be used to support the strategic aims of the brand. **Valideus (13 May 2011).**

**Question 11—proposed alternative address disclosure.** The requirement in question 11 for directors of applicant companies to disclose their permanent place of residence raises concern. An alternative would be to ask for an address within the application company. This is more appropriate when the application is being made on behalf of the company. **Valideus (13 May 2011).**

**Question 11—due diligence improvements.**

COA commends ICANN for reversing at least partially its proposal to cloak in anonymity the identities of key players behind new gTLD applications (evaluation criterion 11(a)). **COA (15 May 2011).**

Regarding new criterion 11(d) dealing with applicants whose legal form lacks directors, officers, partners or shareholders, COA suggests that the individuals whose identities must be disclosed should include not only those with “direct responsibility for registry operations” but also those with legal or senior management responsibility for such operations, which is roughly equivalent to what must be disclosed by other applicants. **COA (15 May 2011).**

**Criterion 11(e) appears (perhaps as a drafting error) to relieve applicants of the responsibility to disclose all felony convictions within the past ten years. For clarity and comprehensiveness the**
language here should be conformed with that of section 4.3(f) of the draft Registry Agreement, which disqualifies a person convicted of “any felony” from continuing to serve as an officer or director of a registry operator. *COA (15 May 2011).*

**Question 18(c) – Domain Parking.** ICANN must remove clause iv from Question 18(c) in the Attachment to Module 2. A policy that discourages a certain form of legal commercial speech at new gTLDs is a form of content regulation and is therefore unacceptable. This question is an inappropriate intrusion into a registrant’s right to utilize a domain name for a lawful purpose. It would impose pressure on applicants to impose rules that would limit parked websites at domains registered within their new gTLD, and equates domain parking with “social costs” and “negative consequences/costs.” Such derogatory association is unfounded and registry-imposed constraints are unjustified and unnecessary. A domain name registrant that has paid the registration fee for a name is entitled to engage in any legal activity with that name, or in fact to not use it at all. Display of ad links on non-infringing generic word domains is equal in legitimacy and usefulness to the paid ad links displayed by major search engines when the same word is entered into them. The suggestion that parking a name and publishing links to data and/or advertising alone is a negative or harmful practice is at best misinformed and certainly incorrect. For ICANN to suggest a role in defining legitimate or illegitimate content is extraordinarily dangerous to the interests of the entire Internet community. This new evaluation criterion is also completely at odds with recognition elsewhere in the April 2011 Discussion Draft that domain parking in and of itself is not a negative criterion under the proposed URS. WIPO has recently adopted a similar view for the guidance of examiners under the UDRP. *Oversee.net (15 May 2011). ICA (15 May 2011).*

**Question 18(c)iii – agreement term clarification.** ICANN should clear up the ambiguity in question 18(c)iii and Sections 2.10(a) and (c) of the registry agreement regarding the period of contracts for domain name registrations (“permanent” or “no greater than ten years”). AusRegistry supports allowing permanent registrations, particularly in the case of single registrant, single user TLDs. *AusRegistry (16 May 2011).*

**Rapid takedown or suspension systems.** The clarification of requirements necessary to obtain 2 points on questions 28 and 29 is useful, but ICANN missed a tremendous opportunity to make an important contribution to the security and stability of the Internet by failing to require that all new gTLD registry operators implement a rapid takedown or suspension system. Further, ICANN compliance must have the resources and mandate to ensure that applicants abide by the representations made in their applications on questions 28 and 29. *Microsoft (15 May 2011).*

**Question 28-- Orphan glue records.** Regarding the issue of management and removal of orphan glue records, SSAC offers the following comments:

1. Orphaned glue is an ambiguous term for which no definitive definition exists. The SSAC has prepared a definition that it recommends be included in the Applicant Guidebook.
2. Orphaned glue can be used for abusive purposes; however, the dominant use of orphaned glue supports the correct and ordinary operation of the DNS. Thus it is inappropriate to include the management of orphaned glue under the rubric of “abuse prevention and mitigation” and SSAC suggests that it be removed.
3. To mitigate the actual abuse of orphaned glue, registry operators should take action to remove these records when provided with evidence that the glue is indeed present to abet malicious conduct. *SSAC (Module 2, 13 May 2011).*

**Question 39 clarification.**
The terms “Recovery Point Objectives” and “Recovery Time Objective” are not defined or explained and it is unclear what applicants are being asked to do. These terms should be explained in the guidebook. RySG (15 May 2011). AFNIC (15 May 2011).

It is unclear what “vital business functions” are in question 39. The statement should be reworded as: “Identification and definitions of vital business functions, defined as those business functions critical in supporting the delivery of Registry Services as defined in Specification 6 of the New gTLD agreement, as well as any other Services defined in the applicant’s response to Evaluation Criteria Question 23.” AusRegistry (16 May 2011).

Definition and consistency of terms used. Question 23 and many other areas of the guidebook use the terms “Registry Services”, “Registry Functions”, and “Registry Operations” interchangeably. Each of these terms should be defined and a consistency check and appropriate update should be performed to ensure clarity. AusRegistry (16 May 2011).

Mark questions 24 and 26 as non-public. Questions 24 and 26 should be marked non-public as they ask the applicant to describe the technical implementation of SRS and Whois systems respectively. Publicizing specific implementation details, such as network designs, can assist an “attacker” in planning system attacks. AusRegistry (16 May 2011).

Question 43—correction. Question 43 under the Scoring column—1-Meets Requirements—appears to have an error. The second half of the sentence states that registries will offer provisioning capabilities to accept public keys from registrants, and implies registries will also provide key exchange, generation and storage. This does not match AusRegistry’s understanding of the intent of this Criteria. AusRegistry requests that “(generation, exchange and storage)” as stated at the end of the bullet point be removed. AusRegistry (16 May 2011).

Question 50 B (i), Letter of Credit (LOC). The current version of the guidebook states: “The LOC is subject to the International Standby Practices (ISP 98) International Chamber of Commerce (Publication No. 590).” According to several bank contacts, ISP 98 is not a commonly used LOC outside of the U.S. and we understand that under the current requirements Japanese banks will have difficulties obtaining such a document. UrbanBrain (16 May 2011).

Analysis of Comments

A comment suggests that government entities, which are subject to independent audit and other public integrity controls, be afforded the same background screening process as publicly traded organizations listed in the top 25 stock exchanges. To clarify, the approach in section 2.1.1 has been put in place to avoid duplicating the background check process on individuals that is already conducted on directors by the top 25 stock exchanges and to keep application processing economical. It is not intended to preclude ICANN from conducting a background screening if required. In addition, typically financial audits conducted by independent third party audit firms do not require extensive background checks of the key individuals responsible for the entity. Accordingly, there would be no duplication of processes or leveraging of work already done by other parties thus background checks of the individuals responsible for the registry will continue as described in the Guidebook.

A comment suggests that a post-launch compliance review be conducted of policies and procedures proposed in the application. Compliance reviews are conducted against the terms of the Registry Agreement. To the extent that certain policies and procedures from the
application period are included in the Registry Agreement then those areas will be reviewed. In addition, the application requires that applicants warrant that the statements and representations contained in the application are true and accurate and complete in all material respects. Any material misstatement could cause an application to be rejected.

Commenter recommend that names such as Olympic trademarks, regional ccTLD organizations, and Red Cross names should be placed on the Top Level Reserved Names List in section 2.2.1.2.

With regard to the inclusion of specific entities' names on this reserved list, it is understood that some names have statutory protection internationally. These can be handled on an objection basis. ICANN is considering the nature of these protections, and whether they should be extended to few and certain entities.

With regard to the ccTLD organizations, this was considered; however, the top-level reserved names list is intended to be as narrow as possible, and cover only those names that have an impact on the DNS infrastructure or are part of the organizational structure of ICANN. The bodies mentioned are important DNS community members, but fall more into the category of constituencies, which are self-formed and self-governed, and it would expand the list considerably to include all of these as reserved names.

Other comments suggested that ICANN should remove its own name from the Top-Level Reserved Names List in section 2.2.1.2. This has been considered, but not adopted yet. It should be noted that ICANN was included on this list as a logical extension of being the organization responsible for operating the program rather than as a means of claiming special trademark protection. It should also be noted that “ICANN” is reserved only at the top level – there is no reservation of “ICANN” at the second level, and ICANN thus uses the same processes for addressing any problematic registrations at the second level as does any other organization.

Some comments suggested that reservation of two-character labels from registration at the second level (per Specification 5 to the Registry Agreement) should be eliminated. Although some commenters took this as a new requirement, this it has been in place since the first draft of the Guidebook and is also contained in current registry agreements. New gTLD operators will have the option to propose release of these labels based on implementation of measures to avoid confusion with the corresponding country codes. A number of existing gTLD operators have submitted and been approved for such requests.

A comment expressed support for the implementation of the Joint ccNSO-GNSO IDN Working Group (JIG) recommendations on enabling one-character IDN TLD labels, while another comment expressed a need for public comment on such provisions prior to implementation. The proposed recommendations for allowing one-character IDN TLD strings are currently under consideration. ICANN is responding to the latest, recently received JIG report with questions on implementation to ICANN’s policy and technical Support Organizations and Advisory Committees.

Application Questionnaire
A number of the comments ask for clarity of certain question terms and, in some cases, have provided suggested wording changes. We thank everyone for providing these comments and request that further questions regarding clarification of terms in the questionnaire be sent to newgtld@icann.org. ICANN will capture and provide a central repository of responses for all
applicants going forward. Each of the relevant comments is addressed below and, as appropriate, will be added to this central repository.

A comment requests that the terms Registry Services, Registry Functions, and Registry Operations be used consistently throughout the application. These terms will be reviewed and the questionnaire adjusted appropriately to ensure consistency.

**Question 11 – Applicant Background**
Comments generally support the expanded background screening process and have included possible improvements to the process. For example, a comment suggests that legal or senior management responsible for registry operations be included especially for those entities whose legal form might lack directors, officers, partners or shareholders. Other comments express concern over the detail being requested of applicants (i.e., home address of key individuals) or the appearance of inconsistency with the draft Registry Agreement (i.e. not requiring disclosure of felony convictions beyond ten years).

The comment suggesting legal and senior management be included has merit and the Guidebook is updated. We also understand the concern with collecting private/confidential information such as a home address for a key individual. However the purpose of requesting the personal home address in Question 11 is for the requirements of the background screening process. Without this information the background screening may not be able to provide relevant, positively confirmed, information about the individual. Consequently the background screening process would be ineffective. We understand that this information is confidential and it will be kept as such as it is submitted and maintained by ICANN.

The term “felony” has been removed to expand the scope of the review to include the conviction of any crime. All criminal convictions need to be disclosed as part of question 11. The ten-year time limit in the questionnaire is for the initial background screening check only. The terms in the Registry agreement remain in place and provide notification to the registry operator that any future convictions of the crimes listed in 4.3(f) do not have a time limit.

**Question 18 – Mission / Purpose**
Comments generally support the inclusion of certain economic questions that will help the community understand better how the TLD will provide benefit and minimize “social costs.” Comments also request that metrics/criteria used to facilitate the weighing of potential benefits/costs should be 1) tangible, 2) transparent, and 3) measurable. In addition, some comments suggest that review criteria should be incorporated that would directly affect whether an application is approved, and be used to hold registry operators accountable for the operation of the gTLD. Finally, a comment suggests that an applicant might secure a TLD with the intent of having a “closed” or internal facing only registry (i.e., having no intent of allowing the general public to register domains) and thus the economic benefit questions under Question 18 would not apply or should be rewritten to account for this type of application.

We agree with the concept that metrics/criteria captured as part of the questionnaire be tangible, transparent, and measurable. However, as has been discussed over several versions of the Guidebook and in several economic studies, exact measurements are difficult to ascertain without first having some relevant, concrete set of data to begin development. The expectation is that data collected in this first round will be used to gauge the effectiveness of the program and will be refined as the program progresses. Relevant data gathered during this review may help inform future rounds, including possible additional criteria for determining whether an application is approved.
We appreciate the clarification sought on Question 18 for “closed” or internal facing only strings. These questions have been added at community request to help inform reviews of the effectiveness of the program. We believe these questions are applicable whether or not the applicant chooses to make the registering of names available to the public. If an applicant indicates that the question, as worded, is not applicable then they must provide rationale to this effect. Note, while these questions will not be scored they will be viewable by the public and will form the basis for future economic studies.

Some comments objected to the inclusion of a question concerning policies on domain parking or advertising in the new set of questions included to inform economic studies. It is acknowledged that these activities are not necessarily equated with negative social costs, and this question has been removed.

Another comment cited confusion on the reference to “permanent” contracts for domain names in question 18(b)(iii). The Registry Agreement requires that: “Registry Operator shall offer registrars the option to obtain initial domain name registrations for periods of one to ten years at the discretion of the registrar, but no greater than ten years.” Additionally, the Registry Agreement requires advance written notice of price increases. The question essentially concerns provisions impacting registrant pricing, and the previous section referencing “permanent” contracts has been removed.

**Questions 24 and 26 – SRS and Whois**
A comment suggests that certain information being requested and made public for these questions could increase the potential for harm as they could be used in planning system attacks. It is important to strike a balance between transparency, particularly regarding public-facing processes, and safeguarding information that could be easily vulnerable to misuse. ICANN is considering whether there are aspects of these questions that should be withheld from public disclosure due to the significance of the risks.

**Questions 28 and 29 – Abuse Prevention and Mitigation and Rights Protection Mechanisms**
A comment suggests that the rapid takedown/suspension systems called for in Questions 28 and 29 should be required for all applicants and that compliance have necessary resources available to conduct reviews as required. We understand the nature of this concern; however, the same type of rapid takedown/suspension requirements may not be necessary or desirable for all types of TLDs. Future policy work within the community might yield best practices for such procedures. In the meantime, the registry has the ability to implement procedures that fit the circumstances of the particular TLD.

Some comments suggested changes to the requirement on orphan glue records in Question 28, including a definition for orphan glue records, and a requirement for a registry operator to remove such records when presented with evidence that they are being used for to abet malicious conduct. These comments have been incorporated.

**Question 39 – Registry Continuity**
A comment requests clarification of the terms “Recovery Point Objectives” and “Recovery Time Objectives” included in question 39. The terms are common Continuity Management (i.e. Business Continuity Planning) terms that focus on the recover of critical data and functions, as defined by the organization.
A Recovery Point Objective (RPO) refers to the point in time to which data should be recovered following a business disruption or disaster. The RPO allows an organization to define a window of time before a disruption/disaster during which data may be lost and is independent of the time it takes to get a system back on-line (the Recovery Time Objective). If the RPO of a company is two hours, then when a system is brought back on-line after a disruption/disaster, all data must be restored to a point within two hours before the disaster.

A Recovery Time Objective (RTO) is the duration of time within which a process must be restored after a business disruption or disaster to avoid what the entity may deem as unacceptable consequences. For example, pursuant to the draft Registry Agreement DNS service must not be down for longer than 4 hours. At 4 hours ICANN may invoke the use of an Emergency Back End Registry Operator to take over this function. The entity may deem this to be an unacceptable consequence therefore they may set their RTO to be something less than 4 hours and will build continuity plans accordingly.

These definitions have been added to Question 39 as a reference for applicants.

Another comment provides additional clarity on what are "vital business functions" and includes a revised language. This language will be considered as an update to the questionnaire.

A comment suggests a clarification to specific language used in Question 43 on DNSSEC; this suggestion has been incorporated.

A comment states that the International Standby Practices (ISP 98) for a Standby Letter of Credit are not generally followed by financial institutions in some regions. The Guidebook has been updated to allow an alternative standard to be incorporated into the letter of credit, if it can be demonstrated to be reasonably equivalent.

TRADEMARK PROTECTIONS

OVERALL RIGHTS PROTECTION MECHANISMS

Key Points

- Comments from every section of the ICANN community and broader Internet community have been thoroughly considered in the development of the trademark protection mechanisms in the Applicant Guidebook.

- Discussions between the Board and the GAC led to numerous changes in and improvements to the RPMs, which were further informed by continued community consultation.

- The trademark protections in the most recent version of the Applicant Guidebook provide stronger protections than any previous version and are intended to create a balance between all interested parties.
General

Support for trademark protections in current guidebook.
Substantial trademark protections have been developed for new gTLDs. ICANN has come a long way in providing protections for trademark owners in the new gTLD process with a substantial amount of additional protections at the top and second levels compared to what is afforded today for existing gTLDs. Neustar et al. (15 May 2011).

Following extensive work by the ICANN Board and the GAC, we now appear to be much closer to the original IRT proposals and we applaud ICANN for making these important and welcome changes. Hogan Lovells (15 May 2011). FICPI (Module 3, 15 May 2011).

The RPMs are inadequate.
ICANN’s plan does not meet its Affirmation of Commitment obligations (para. 9.3). To prevent abuses such as consumer fraud as well as user confusion, the plan still requires businesses to pay for defensive registrations or file IP claims in hundreds of new gTLDs at prices that are unconstrained by ICANN or other regulatory bodies. The legal expenses and other costs of defensive registrations and IP claims will not be offset by potential economic or informational value to either registrants or Internet users. AIPLA (13 May 2011).

The critical issue of trademark protection remains unresolved in the revised guidebook, even at this late stage. Adobe Systems (13 May 2011). NCTA (Module 2, 13 May 2011).

The RPMs are still substantially weaker than those recommended by the IRT. BC (15 May 2011).

It is frustrating and unreasonable that ICANN and its staff have failed to address numerous constructive suggestions made by the ICANN community for modifying specific RPMs on the basis that the proposals are beyond those proposed by the IRT. Regardless of that issue, much work remains to be done to implement effective RPMs consistent with those recommended by the IRT and as discussed with the GAC. IACC (15 May 2011).

There should be a globally protected marks list (GPML). Absent a GPML, trademark holders must pay for unwanted defensive registrations. BC (15 May 2011). Coca-Cola (15 May 2011).

RPMs must be cohesive, implementable and consistent with existing frameworks.
If the current RPMs are now presented as complete, their actual “design” unfortunately can seem almost random, with lobbied positions tacked on as an expedient. This not only harms the stated purpose of the RPMs, but risks a disservice to the DNS itself, missing a contractual opportunity for a forward-looking approach to the functional integration of norms. WIPO remains committed to workable IP dispute prevention and resolution solutions and is available to share its experience and expertise with ICANN. WIPO Center (13 May 2011).

It is paramount that the processes that ICANN sets be practical and capable of implementation in order to make the process fully reliable. MARQUES/ECTA (15 May 2011).

ICANN’s approach to RPMs should be consistent with the principle of adhering to existing IP frameworks and not creating new law. USCIB (15 May 2011).
Role of WIPO. Far greater weight should be given to the views of WIPO as the leading non-profit organization with extensive experience in resolving IP disputes in the domain name space and wider. MARQUES/ECTA (15 May 2011).

Single registrant TLDs – RPMs. Existing RPMs (e.g. UDRP and sole remedy of transfer of a second-level registration) may not function in respect to single-registrant TLDs. In the case of a single-registrant TLD there should be an additional remedy as an alternative to transfer of the registration. It is suggested that it be allowed that the second level name is reserved and non-resolving. Single registrant TLDs should not be required to allow unaffiliated registrants to hold registrations in a single registrant TLD. Such third party registrations could cause consumer confusion and in extreme cases be a vehicle for fraud. BC (15 May 2011).

Analysis of Comments

Comments from every section of the ICANN community and broader Internet community have been thoroughly considered in the development of the trademark protection mechanisms in the Applicant Guidebook.

Some commenters applaud and support the most recent version of the Guidebook and the trademark protections as they have evolved. Others continue to state that the trademark protections are still not enough to protect trademark holders or minimize the need for defensive registrations (with some repeating the call for a globally protected marks list). Still others question the cohesiveness of the scheme of trademark protection mechanisms or whether they can properly be implemented.

Reflecting on the chronology of events that led to the development of the trademark protections now included in the New gTLD Program continues to be important. This historical review must be understood within the ICANN framework of a multi-stakeholder, bottom-up consensus building organization.

As most will recall, after the early versions of the Applicant Guidebook were posted, the trademark community made clear that more and specific trademark protections were needed. ICANN heeded those remarks. Accordingly, the Board resolved to establish an Implementation Recommendation Team (IRT), to help identify and propose rights protection mechanisms (RPMs) for trademark holders within the New gTLD Program (see http://www.icann.org/en/minutes/resolutions-06mar09.htm#07).

The IRT described itself as 18 people experienced in trademark protection on the Internet. The Board asked the IRT to develop a workable and acceptable set of RPMs for the New gTLD Program. The IRT engaged in intensive substantive discussion and, just as in most such ICANN processes, the public was invited to respond to ongoing IRT work.

Ultimately, the IRT developed specific recommendations reflecting the views of business and trademark interests, which included proposals for an IP or Trademark Clearinghouse (Clearinghouse), a Uniform Rapid Suspension System (URS), and a Trademark Post-delegation Dispute Resolution Procedure (PDDRP). The Clearinghouse included an IP Claims Service, a Sunrise Service, and a Globally Protected Marks List (GPML). (http://icann.org/en/topics/new-gtlds/irt-final-report-trademark-protection-29may09-en.pdf).

Concerns from the broader ICANN Community immediately emerged with respect to several
IRT recommendations. After significant public comment, through both the public comment forum and numerous face-to-face meetings, refinement of the IRT proposals were called for to balance the interests of the community as a whole, the trademark holders, and registrants with legitimate interests in registering domains that might also be the subject of a trademark. Compromises were also required in light of the implementation difficulties of some of the IRT proposals.

The next iteration of the Guidebook included nearly all of the trademark protection mechanisms suggested by the IRT, including the Clearinghouse (including IP Claims and Sunrise processes), the URS and the PDDRP. The GPML was not included in light of, among other things, the implementation difficulties with, and the significant opposition to, such a list. In 2009 the Board noted that a GPML was not adopted and noted some of the reasons:

> [I]t is difficult to develop objective global standards for determining which marks would be included on such a GPML, such a list arguably would create new rights not based in law for those trademark holders, and it would create only marginal benefits because it would apply only to a small number of names and only for identical matches of those names. See http://www.icann.org/en/minutes/resolutions-25sep10-en.htm#2.6.

After further comment, discussion and revision, the Board requested the GNSO Council’s view on whether the then versions of the Clearinghouse and URS proposals were consistent with the GNSO’s proposed policy on the introduction of new gTLDs. The Board asked whether these RPMs were appropriate and effective for achieving the GNSO’s stated principles and objectives.

In response to the Board’s request, the GNSO established the Special Trademark Issues Review Team (STI), consisting of members of each Stakeholder Group, At-Large, Nominating Committee Appointees, and the GAC. The STI recommended several revisions to the Clearinghouse and the URS proposals (see http://www.icann.org/en/announcements/announcement-2-17dec09-en.htm), which were unanimously adopted by the GNSO.

ICANN also invited community participation in an open consultation process to discuss and propose revisions to, among other things, the PDDRP. This group was formed as the temporary drafting group (TDG).

Together, the IRT recommendations, the STI revisions, the TDG revisions, and comments from every section of the ICANN community and broader Internet community were taken into consideration in the development and iteration of the RPMs. As a result of public comment, a requirement to maintain a “tick Whois” database was added to the proposed registry agreements.

Over the past several months, the RPMs have undergone some significant further refinements in response to advice from ICANN’s Governmental Advisory Committee (GAC). In its Cartagena Communiqué (http://gac.icann.org/system/files/Cartagena_Communique.pdf), the GAC identified 12 specific areas in the New gTLD Program with which it had concerns. The GAC later provided ICANN with an “Indicative Scorecard” indentifying 80 individual items for discussion (http://www.icann.org/en/topics/new-gtlds/gac-scorecard-23feb11-en.pdf).

The Board and GAC subsequently engaged in extensive discussions, including numerous calls with individual GAC members and Board members (topic leads), a dedicated two-day consultation between the ICANN Board and the GAC in Brussels, an exchange of follow-up written comments and responses from both the Board and the GAC, additional face-to-face...
consultations between the GAC and Board in the ICANN San Francisco meeting, additional individual calls among GAC and Board topic leads, and a GAC/Board telephonic consultation on 20 May 2011.

These discussions between the Board and the GAC lead to numerous changes in and improvements to the RPMs, which were further informed by continued community consultation.

The trademark protections in the most recent version of the Applicant Guidebook provide stronger protections than any previous version and are intended to create a balance between all interested parties with a main focus of protecting consumers, including both registrants and Internet users.

The trademark protections now part of the new gTLD Program include:

- The requirement for all new registries to offer both a Trademark Claims service and a sunrise period.
- The establishment of a Trademark Clearinghouse as a central repository for rights information, creating efficiencies for trademark holders, registries, and registrars.
- Implementation of the URS that provides a streamlined, lower-cost mechanism to suspend infringing names.
- The requirement for all new gTLD operators to provide access to — thick Whois data. This access to registration data aids those seeking responsible parties as part of rights enforcement activities.
- The availability of a post-delegation dispute resolution mechanism that allows rights holders to address infringing activity by the registry operator that may be taking place after delegation.

In addition, the existing Uniform Domain Name Dispute Resolution Policy (UDRP) continues to be available where a complainant seeks transfer of names. Compliance with UDRP decisions is required in all new, as well as existing, gTLDs.

Each of the recommendations above is intended to provide paths to protect rights other than defensive registrations for trademark holders.

Further, the application process itself, based on the policy advice, contains an objection-based procedure by which a rights holder may allege infringement by the TLD applicant. A successful legal rights objection prevents the new gTLD application from moving forward: a string is not delegated if an objector can demonstrate that it infringes their rights.

One group recommends that WIPO be consulted in light of its role in trademark disputes. WIPO’s contributions have been extremely valuable throughout the development of trademark protections in the New gTLD Program. WIPO has agreed to serve as the dispute resolution provider for all pre-delegation legal rights objections and was instrumental in the drafting of the standards under which such objections will be reviewed. Inputs from WIPO to all other RPMs are also important to the entire multi-stakeholder consensus process that has been at the heart of the New gTLD Program.

Finally, one group representing business interests comments on the applicability of existing trademark protection mechanisms, such as the UDRP, specifically the transfer remedy, to single
registrant or .BRAND TLDs. While this is not something relevant to the new RPMs, this is something for later consideration depending on how single-registrant TLDs evolve.

Trademark Clearinghouse (Clearinghouse)

Key Points

- The Clearinghouse is meant to be a database of intellectual property rights; its purpose is not to house data that would support blocking of domain name registrations.
- Requiring the trademark claims process to continue beyond the launch of registry operations, could potentially knock out businesses that already offer Watch services, and require development of a very different technological solution than what is planned for the Clearinghouse.
- Limiting Trademark Claims and Sunrise protection to identical match of a trademark, at least until the system can be tested in practice and reviewed, is an appropriate limitation.
- The requirement for demonstration of “use” is universal, no jurisdictions are favored over the other based on the level of review trademarks receive in that jurisdiction

General

Summary of Comments

Purpose.
The purpose of the Clearinghouse should be to list a number of different “name” rights that, depending on the jurisdiction, could be used as a basis to create an obstacle to registration of a certain domain name. A Complainant in a .eu domain name dispute can rely on, inter alia, registered national and Community trademarks and, in as far as they are protected under national law in the Member-State where they are held: unregistered trademarks, trade names, business identifiers, company names, family names, and distinctive titles of protected literary and artistic works (Article 10(1) of the European Commission regulation 874/2004). The Clearinghouse should allow collection of such prior rights, whereas it will be up to each gTLD provider to regulate if only registered and common law trademark rights may be relied upon or whether other nationally protected name rights can form the basis of an objection as well. FICPI notes that 3.2.1’s revision to cover “nationally or multi-nationally registered word marks from all jurisdictions” is a step in the right direction—e.g. now European Community trademarks are given the same status as U.S. trademark registrations. FICPI (Module 3, 15 May 2011).

More details needed.

Clarification remains outstanding on such matters as the relation to trademark office determinations; fee apportionment measures; any envisaged process for Clearinghouse
removal of marks; and treatment of non-Latin script and word+design marks. WIPO Center (13 May 2011).

ICANN proposes that the Clearinghouse provider may actually be two entities—the “authenticator/validator” and the “administrator,” which is confusing because only the second entity will really be “the clearinghouse.” ICANN needs to clarify what roles each entity is to play, including with respect to Sunrise Eligibility Requirement complaints. There is no information in the guidebook on what a Sunrise Dispute Resolution Policy will even look like or how it will be implemented, highlighting a further gap in the new gTLD proposal. It is also unclear how the Clearinghouse itself is supposed to provide Sunrise services, rather than simply be a repository of information that is used in support of such services. More broadly, the Clearinghouse is still full of “proposals” of what the requirements “should be” rather than proposed firm requirements. Other issues are left open, such as penalties for failure to keep information in the Clearinghouse up-to-date, which if significant enough could cripple the entire system. Neither ICANN nor the Internet community really knows what final Trademark Clearinghouse requirements are being proposed. INTA (14 May 2011).

Proposal: Draft Trademark Claims Notification Process. Neustar et al. has produced a proposal to assist ICANN with the construction of the RFP for Clearinghouse Providers and to provide guidance to the new gTLD Registry applicants on how an implementation of a 60-day Trademark Claims Notification process could work. Neustar et al. recommends a flexible, yet consistent mechanism that also preserves options for a multitude of business models that may emerge for potentially hundreds of new gTLDs. Neustar et al. would like the several assumptions it makes in the proposal to be included in the final version of the AG. Neustar et al. (15 May 2011).

Clearinghouse Service Provider(s). ICANN should contract with a single entity for the Clearinghouse functions, covering the validator and administrator roles. This places accountability with a single body and enables the Clearinghouse to evolve its business processes over time and without concern or conflicts with organizational boundaries between the administrator and validator roles. Contracting with two parties introduces complexity which could result in delays in implementation of the Clearinghouse and possibly also in the introduction of new gTLDs. The process to find a Clearinghouse service provider must commence without delay, and ICANN should convene a working group from the ICANN community to share ideas on the design of the Clearinghouse. (Note: For specific Module 5, section-by-section comments and suggested language edits for Trademark Clearinghouse, see EnCirca comments at pp. 2-5). EnCirca (14 May 2011).

Clearinghouse relationship to other RPMs.
The Clearinghouse is only utilized during initial launch and is not integrated with other RPMs such as the URS. Adobe Systems (13 May 2011).

ICANN should explain how the Clearinghouse and the URS will be linked in order to save trademark owners costs, and ultimately protect end users from fraud. News Corporation (13 May 2011).

INTA continues to stress the importance of minimizing costs by integrating the Clearinghouse to support the URS, in addition to Sunrise/Claims services. Depositing a mark in the Clearinghouse should not be a prerequisite to using the URS, but the validated information in the Clearinghouse should be available to support a URS complaint, e.g. to establish ownership of a registered mark. INTA (14 May 2011).
Use of Clearinghouse in UDRP. Trademark owners should be able to take advantage of using the Clearinghouse when seeking relief from abuses under the UDRP both for purposes of registrations for new gTLDs and under the existing gTLDs. AutoTrader.com (Module 2, 13 May 2011).

Word Choice. Section 4.3 and elsewhere in the Clearinghouse proposal refer to notice of a trademark claim being given to the “registrant” prior to the domain name being registered. Prior to registration the entity receiving the notice is only an “applicant.” Misuse of the term “registrant” invites confusion. ICANN should also make clear that the “notice” system involves two notices—one to the applicant that there is a match of the proposed domain name to a mark in the Clearinghouse, and another to the trademark owner if the applicant proceeds to register the domain name anyway. INTA (14 May 2011).

Name change. The name should be “IP Clearinghouse,” as recommended by the IRT. FICPI (Module 3, 15 May 2011).

Analysis of Comments

One commenter suggests that the Clearinghouse’s purpose should be “to list a number of different ‘name’ rights that could be used as a basis to create an obstacle to registration of a certain domain name.” It is true that the Clearinghouse is meant to be a database of intellectual property rights, but it was not established to house data that would support blocking of domain name registrations. This same commenter suggests that registries should have discretion as to what it protects in the various RPMs it must offer. Such discretion is available - after mandatory protections are provided. Registries must recognize certain trademarks, but they have discretion to recognize and protect additional intellectual property marks that are allowed in the Clearinghouse. Finally, this commenter does recognize and appreciate that registered trademarks from all jurisdictions are treated equally in terms of what must be recognized.

Some suggest that more details are needed with respect to Clearinghouse operations and others note that the development process should begin without delay, and in consultation with the community. We agree and are working to a timeline that ensures the availability of the Clearinghouse in time for the anticipated launch of the new gTLD process.

Implementation details are now in development. In particular, some community members have produced a proposal to assist with the construction of the RFP for Clearinghouse Providers and to provide guidance on implementation of a 60-day Trademark Claims Notification process. This proposal is a part of developing specific operational details for the Clearinghouse, which will evolve according to a plan in consultation will all interested community members and the selected Clearinghouse Provider(s). The selection process will also inform the decision as to whether one or two separate providers will be required.

Some commenters seek clarification on how the Clearinghouse will be integrated in relation to other RPMs. As noted in both the URS and the PDDRP, data that is housed in the Clearinghouse can be used as evidence to support standing in both RPMs. For example, proof of use of a trademark is required to support either a URS or PDDRP proceeding; the proof of use that is validated by the Clearinghouse can serve as such evidence in those RPM proceedings. How the Clearinghouse can be used to support existing RPMs such as the UDRP has not been to topic of discussion in the new gTLD Program.
One suggests that “registrant” be changed to “applicant” when discussing trademark claims process notices before the registration is actually completed. This comment is well-taken. Accordingly, “registrant” in this context will be revised to be “prospective registrant.”

No changes will be made to the name of the Trademark Clearinghouse.

**Fees and Costs**

**Summary of Comments**

**Funding from multiple sources.** The cost of inclusion of a mark in the clearinghouse should be kept as low as possible with funding coming equally from users of the system, e.g. trademark owners, registries, registrars and from ICANN itself. *Valideus (13 May 2011).*

**Costs and operations timing.** The Clearinghouse should be established well in advance of the commencement of operation of any of the new gTLDs and the cost for setting up the clearinghouse system should be fully borne by ICANN as part of the expenses of the new gTLD program. Setting it up well in advance in an open and transparent manner and providing public guidance on its operation may reassure many brand owners that they will be able to protect their trademarks. ICANN bearing the cost will advance consumer confidence in ICANN and new gTLD applicants’ shared fiscal responsibility in implementation of the new gTLD program. Brand owners have many trademark costs outside the clearinghouse (e.g., obtaining and maintaining trademark registrations to permit participation in the clearinghouse) and should only be responsible for reasonable charges for recording their trademarks in the clearinghouse. In this way trademark owners will have some reasonable assurance that the gTLD program will not significantly increase their operating costs. *IBM (13 May 2011).*

**Reasonable costs.** The costs related to the Clearinghouse need to be reasonable in order for it to remain an effective tool for brand owners. *MARQUES/ECTA (15 May 2011).*

**Reduced fees for not-for-profit organizations (8.0).** The Clearinghouse should feature reduced fees for not-for-profit organizations and ICANN’s negotiations with the Clearinghouse provider should incentivize such reduced fees. *NPOC (16 May 2011).*

**Analysis of Comments**

One commenter suggests that funding should come from the users of the system. That is precisely how the Clearinghouse is expected to be funded. See Section 8 of the Clearinghouse proposal: “Costs should be completely borne by the parties utilizing the services. Trademark holders will pay to register the Clearinghouse, and registries will pay for Trademark Claims and Sunrise services. Registrars and others who avail themselves of Clearinghouse services will pay the Clearinghouse directly.” Further, it has always been the intent the Clearinghouse costs are reasonable and that will be considered in the solicitation process.

With respect to who will fund the initial establishment of the Clearinghouse, it has always been planned that ICANN and the Clearinghouse Service Provider(s) shall bear that burden, as deemed appropriate.
At present there is no plan to make reduced Clearinghouse fees available to any particular section of the community, such as non-profit organizations. That is a possibility that can be discussed with potential Clearinghouse Service Provider(s).

### Eligibility for Inclusion and Protection

#### Summary of Comments

**Marks to be Included in Clearinghouse.**
AIPLA supports the change made in the most recent version of the guidebook that any “marks which constitute intellectual property” can be included in the Clearinghouse. AIPLA (13 May 2011). Partridge (14 May 2011). Time Warner (14 May 2011).

INTA recommends that paragraphs 1.3 and 1.5 be revised to clarify that the data regarding other types of intellectual property is not an “ancillary service” and paragraphs 3.2.4 and 3.3.6 be revised to correctly articulate what constitutes intellectual property. INTA (14 May 2011).

CADNA would like more elaboration on the change made removing the language that no common law marks should be included in the Clearinghouse. CADNA is pleased with the idea of expanding the definition for inclusion in the Clearinghouse, although it seems that marks that constitute intellectual property of other types than those specifically described will be determined by the registry operator and Clearinghouse, which seems to give those two entities a significant amount of power. CADNA (13 May 2011).

The Clearinghouse should include common law trademarks, rather than limiting the Clearinghouse to court-validated or registered trademarks. Extending protection to common law trademarks that are substantively authenticated would streamline other RPMs, such as the UDRP (and other domain name dispute resolution policies) and the URS, which allow claims for relief based on common law rights. IACC suggests that at a minimum registry operators should be permitted to include such marks in their RPM, and in order to do so will need the data about those rights in the Clearinghouse. IACC (15 May 2011).

Sections 2.2.1, 3.2.1 and 3.2.3 need to be amended to include figurative registered trademarks. The developed UDRP/WIPO precedent and the clearly inclusive intention of the GAC towards both figurative trademarks and word marks leave ICANN with a clear directive to include both legally recognized forms of trademarks in the DAG and the Trademark Clearinghouse. M. Harper (16 May 2011).

The Clearinghouse should also be allowed to validate stylized marks that are nothing more than a word mark presented in a different font. In addition to presenting the stylized mark, certificates of registration present the mark in standard font, so the Clearinghouse would not have to exercise either discretion or subjectivity in order for stylized marks to be protected by the RPMs. NCTA (Module 2, 13 May 2011).

The Clearinghouse should accept marks that include a TLD. It is incorrect to state that a dot-TLD mark cannot indicate source—it depends on how it is used. Numerous marks that incorporate a TLD, many of which are well-known, are registered in the U.S. and other jurisdictions worldwide. Despite its repeated position that all registered trademarks should be treated alike, the Board has singled out this one category of marks that will be denied protection under the RPMs. It is the gTLD by itself that is generic and does not identify source. As a
practical matter there is no material difference between a mark consisting of a term followed by a TLD and the term alone. Thus either adding or deleting the TLD from a registered mark is permitted by the U.S. Patent and Trademark Office. NCTA urges ICANN to adopt the same approach—i.e., permit the validation of marks that incorporate a TLD and categorize them as the same mark without the TLD. NCTA (Module 2, 13 May 2011). AutoTrader.com (13 May 2011).

NCUC opposes use of the Clearinghouse in the future as a database for intellectual property rights beyond trademark—it is a mechanism for trademarks and should remain as such. To effect this, in Section 3.2.4 the phrase “but certainly not copyrights, patents, designs or any other form of intellectual property” should be added after the words “intellectual property.” The meaning of the term “other marks” in Section 3.2.4 should also be clarified by ICANN. NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

The recent creeping expansion in scope of the fee-based Clearinghouse must be viewed with caution. In determining appropriate types of identifiers, ICANN should bear in mind international and national IP norms. WIPO Center (13 May 2011).

Mandatory Claims Service and Sunrise Process.
AIPLA supports the change that now requires gTLD registries to provide both of these mechanisms. AIPLA (13 May 2011).

INTA agrees that Sunrise services should be limited to a 30-day period before the launch of a gTLD. INTA (14 May 2011).

Post-launch Claims.
While we are pleased that all new gTLD registries must have both a Trademark Claims Service and a Sunrise process, neither of these mechanisms have proven sufficient to hinder or reduce the number of domain names registered in bad faith. Both are for the pre-launch or initial launch period. Infringements of rights occur not just in the launch phase but more often after such a phase and for as long as the registry operator is active. The Trademark Claims Service needs to be post-launch as well to have any real value. LEGO (Module 5, 12 May 2011). Arla Foods (13 May 2011). IPC (15 May 2011). NPOC (16 May 2011).

The Claims Service requirement should be extended to the first 6 months to provide notice to the trademark owner and potential registrant. NPOC (16 May 2011).

AIM recommends a change for Trademark Claims (6.1.1) that “[ne]w gTLD Registry Operators must provide Trademark Claims services AT ALL TIMES for marks in the Trademark Clearinghouse.” (Once set up, to continue to use this service will add large benefit at small cost). AIM (Module 5, 12 May 2011).

The gTLD Registry Operators should offer trademark Claims Service at any time a domain name is registered. BC (15 May 2011).

The Trademark Claims Service should be allowed to run in perpetuity for the life of the gTLD Registry. Hogan Lovells (15 May 2011). NCTA (Module 2, 13 May 2011).

The planned limitation to the proposed 60-day Trademark Claims construct invites gaming. WIPO Center (13 May 2011).

Mandating that new gTLD registries implement a perpetual Trademark Claims has the potential of placing the new gTLDs at a competitive disadvantage to the incumbent TLDs who do not have to implement that RPM. If the ICANN community believes that there should be a perpetual IP Claims process required for all TLDs (both new and existing), it can decide to launch a bottom-up policy development process to require its implementation. This should only be done after we get some experience dealing with the Trademark Claims process so that the community can properly evaluate the yet untested RPM. Neustar et al. (15 May 2011).

We generally object to the idea of the Trademark Claims Service to be extended 60 days after the initial launch. One would think that the Claims Service and Sunrise period services both allow the trademark community to make legitimate claims before anyone else. We cannot understand the rationale of allowing a trademark claim service after initial launch and believe it will be an administrative nightmare for registries and registrants. Accordingly in Section 6.1.1 the following sentence should be deleted; “This launch period must occur for at least the first 60 days that registration is open for general registration.” NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

Identical Match Limitation.
The Trademark Claims service needs to cover more than identical matches. Most cybersquatting is not an identical match to the trademark being squatted but contains different generic words. Such cases of trademarks plus generic terms must also be covered by the Trademark Claims Service if ICANN intends for such a service to have any real value. LEGO (Module 5, 12 May 2011). Arla Foods (13 May 2011). Adobe Systems (13 May 2011). Hogan Lovells (15 May 2011). SIIA (15 May 2011). IPC (15 May 2011). NCTA (Module 2, 13 May 2011).

The Clearinghouse should not be limited to identical matches. It should include trademarks paired with a descriptive term. At a minimum, a match should include plurals of and domain names containing the exact trademark. Inclusion of such provisions will help avoid expensive enforcement actions and defensive domain name registration. IACC (15 May 2011). COA (15 May 2011). Coca-Cola (15 May 2011). NPOC (16 May 2011). FICPI (Module 3, 15 May 2011).
Protection needs to be wider than identical matches to include in particular plurals, “mark plus descriptive term” and “mark plus device.” Cyber squatting is not restricted to identical marks and this needs to be recognized. *BBC (Module 5, 13 May 2011).*

IP Claims services should be expanded to cover all strings which comprise the exact match, or plurals of the exact match, or the exact match along with key terms associated with the goods or services relating to the mark (such terms being identified by the mark owner in the Clearinghouse application), or typographical variants of the mark (identified by the mark owner in the Clearinghouse application. Strings falling into these categories could be flagged by software, thus eliminating the need for the Clearinghouse to exercise discretion. *INTA (14 May 2011).*

In the Claims Service, a notice should be sent if an application contains a character string that features in the Clearinghouse (rather than consists of a mark in the Clearinghouse). Many infringements take a trademark and add a descriptive term such as PRADA-BAGS. Such notices could help reduce conflicts. *Valideus (13 May 2011).*

The Claims Service should apply to domain names that either consist of or contain textual elements of marks entered into the Trademark Clearinghouse. Limiting the scope to only domain names that consist of textual elements of these marks is too narrow and does not correspond to the unfortunate reality that the vast majority of abusive domain name registrations are for domain names that are MARK+word. *Microsoft (15 May 2011).*

AIM suggests the following change because sunrise will only be effective if it matches the behavior of fraudsters: “This notice will be provided to holders of marks in the Clearinghouse that are an Identical Match or CONFUSINGLY SIMILAR to the name to be registered during Sunrise.” *AIM (Module 5, 12 May 2011).*

The need for an exact match is recognized in sunrise services in order to ensure that the system affords appropriate trademark holders an opportunity to register their marks early. However, the standard of “identical or confusingly similar” should be applied in the ongoing IP claims service. *News Corporation (13 May 2011).*

The Sunrise service should be provided for marks which are an identical match or confusingly similar to the name to be registered during Sunrise. *BC (15 May 2011).*

The planned limitation to exact matches invites gaming. *WIPO Center (13 May 2011).*

Trademark Claims and Sunrise Services should extend beyond identical matches. If UDRP or Suspension proceedings determine that there is a “confusing similarity” between a domain name and a trademark, then the trademark owner should be able to place that second level domain name in the Clearinghouse, and refer to it in Claims and Sunrise Services. Otherwise, the same second level domain name could arise repeatedly in various new gTLDs, even after being cancelled or frozen in successful UDRP or Suspension System proceedings. *IOC (15 May 2011).*

If ICANN considers going beyond exact matches for Trademark Claims where the added term relates to the trademark in a “significant way” (Public Comment Summary Feb. 21, 2011 at pp. 50, 62), it could limit the additional term to any goods or services identified in registrations for the mark. Limiting the number of additional entries to a particular number would be arbitrary and
would disadvantage trademark owners whose mark is used to brand numerous products. *NCTA (Module 2, 13 May 2011).*

**Proof of Use.**

The guidebook should be revised to make it clear that the function of establishing use is separate from the function of validating registered marks and that owners of registered marks have the option of offering evidence of use (those that do not will only be able to utilize the Trademark Claims service). *NCTA (Module 2, 13 May 2011).*

The declaration/proof of use (5.2, 7.2) should be submitted to the Clearinghouse for marks not protected via court, statute, or treated only periodically—perhaps every 3 years—not a requirement prior to the participation of each Sunrise period. *NPOC (16 May 2011).*

Regarding proof of use, we agree that one party should not arbitrarily be able to stop another party from using a mark. However, in addition to dropping proof of use in trademark service claims, it should also be dropped for sunrise service, URS, and PDDRP because it makes the RPM tapestry cumbersome and complicates the process. In effect, ICANN will create separate criteria from established systems in sovereign countries. RPMs were not meant to be a substantive review system; they were meant to protect brand owners and ultimately consumers. *News Corporation (13 May 2011). Microsoft (15 May 2011). IPC (15 May 2011).*

If the use requirement is maintained, there should not be a requirement for a specimen. Neither ICANN nor the Trademark Clearinghouse has the requisite expertise to evaluate the sufficiency of a specimen. A sworn declaration is all that should be required. *NCTA (Module 2, 13 May 2011).*

The requirement of use does little to stop the ability of a registrant to “game the system.” Today, digital renderings of products and services can be easily and quickly created. Instead, the protections surrounding the “use requirement” that the Board seeks are delivered by requirements of sworn statements and the power to address fraudulent claims. *Microsoft (15 May 2011).*

Requiring the Trademark Clearinghouse to make determinations about use threatens to add considerable and wholly unneeded complexity and cost to its function. The use requirement should be dropped. *Time Warner (14 May 2011). INTA (14 May 2011). IPC (15 May 2011).*

Requiring proof of use on top of a trademark acquired in accordance with national law is potentially a denial of such a right and/or an additional cost for trademark owners to bear. *Hogan Lovells (15 May 2011).*

Showing “proof of use” seems inconsistent with the purposes of the Trademark Clearinghouse, when the trademark systems of many nations do not require use. *SIIA (15 May 2011).*

By insisting that use be shown in both the Clearinghouse and the URS, without specifically linking the two as recommended by the IRT, there could be two different decisions on a mark’s protectability in the new gTLD system. The use requirement should be eliminated. If it is maintained, then the Clearinghouse determination that a mark is in use should determine that issue for the purpose of a URS proceeding in which the mark is cited. *INTA (14 May 2011).*

By eliminating the substantive review requirement for Trademark Claims, URS and the PDDRP and by expanding the role of the Clearinghouse to validating use of marks, ICANN has also
eliminated the absolute grounds evaluation requirement. Presumably this change was unintended but needs to be corrected. NCTA (Module 2, 13 May 2011).

Date limitation.
The fixed date of 26 June 2008 is not appropriate as it excludes newer trademarks and goes against the spirit of innovation which is driving the new gTLD opportunity. A flexible date is preferred, such as six months before submission into the Clearinghouse which will serve the Clearinghouse going forward. Valideus (13 May 2011).

Participation in Sunrise services for first round new gTLDs should be restricted to registrations that issued on or before the effective date of the relevant gTLD Registry Operator’s Registry Agreement and that were applied for before ICANN announced the new gTLD applications received in the first round. This restriction will decrease gaming but is broad (and recent) enough to be appropriately inclusive. If ICANN rejects this restriction, it should eliminate the failure to meet this requirement as a ground on which a Sunrise Eligibility Dispute Procedure can be based (6.4.2). Microsoft (15 May 2011).

The date 26 June 2008 has been deleted elsewhere in the April guidebook; why is this date retained for 7.2 Sunrise services? BC (15 May 2011).

The 26 June 2008 should be deleted for 7.2 Sunrise Services as modified in other provisions, allowing word marks protected by future statutes and treaties the same protection. NPOC (16 May 2011).

The use requirement is an additional evidence measure on the trademark owner. It must not become a deterrent measure for newly registered marks which are not in use yet. This is in favor of all kinds of enterprises, including small companies with less means. We would welcome a date being set later than 2008. MARQUES/ECTA (15 May 2011).

Protection in Claims. IBM notes with appreciation the requirement that registries must recognize and honor all word marks that have been or are: (i) nationally or multi-nationally registered; (ii) court-validated; or (iii) specifically protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion and that demonstration of substantial examination or use is not required. IBM (13 May 2011).

Analysis of Comments

Many comment on what types of marks should be included in the Clearinghouse and some suggest additional items that should be included. In particular, commenters suggest inclusion of common law marks, stylized marks, figurative marks and marks that include a TLD label (such as icann.org). Some support the addition of “any marks which constitute intellectual property.” Others seek additional clarification. Further, there are also commenters that question and caution against the expansion of the Clearinghouse data base beyond trademarks.

Except for marks with a TLD that are specifically excluded, such as icann.org, all of the other marks suggested by commenters are allowed in the Clearinghouse database. But, as one commenter suggested, protection or recognition for anything beyond what the registry operators are obligated to honor in either claims or sunrises processes, will be up to the registry. Further, how such recognition is effectuated will be up to the registry operator and the Clearinghouse to work out as part of an ancillary service.
As previously noted several times, marks with TLDs are not allowed in the Clearinghouse. The Clearinghouse is designed to be a repository for trademarks. To fulfill the objectives of the IRT and the STI, it has been decided that those marks that actually function as trademarks, i.e., indicate source, are those that will be eligible for inclusion. Many safeguards have been established to prevent abuse and to ensure neutral application of validation standards, including objectively verifiable data that the mark does serve a legitimate trademark purpose. It has been successfully argued that TLDs standing alone do not serve the trademark function of source identification. Instead of telling consumers "what" a product is or who makes it, they tell consumers where to get it. Because the TLD, standing alone, does not indicate source, and because allowing marks in the Clearinghouse that include a TLD will increase the likelihood of confusion, abuse and gaming, on balance they are excluded. This exclusion will also obviate the need for registration of defensive trademarks in this area.

Commenters universally support the recent revision making bothTrademark Claims and Sunrise processes mandatory. Many suggest, however, that Trademark Claims should be required to continue beyond the initial 60-day period now called for. Some suggest it continue in perpetuity. At this juncture, but subject to review as the new gTLD program progresses, registry operators will only be required to maintain a trademark claims process for 60 days before standard registry operations begin that includes the resolution of domain names and registering names on a “real-time” basis. Requiring trademark claims to continue in perpetuity, not only could potentially knock out businesses that already offer Watch services, but from a development perspective it is a very different technological solution to build a Clearinghouse that provides IP Watch services. If the Clearinghouse wants to expand (or others want to use Clearinghouse data) beyond the mandatory time period it is free to do so, but as an ancillary service.

Another topic that has garnered significant comment is whether the Trademark Claims or Sunrise protections should extend beyond identical match to the relevant trademarks. Some suggest identical match + keywords, others suggest including plurals of trademarks and still others suggest typographical errors or all words that contain the trademark should be included. At present there is no plan to extend mandatory protection beyond identical match. It is important to note that both the IRT and the STI recommended that such protections be limited to identical match. Further, the Clearinghouse is an automated system, and would require additional structural engineering if trademark claims went beyond identical matches. In trademark disputes, for example, there is a judge or a panel with the ability to determine if a domain is substantially similar to a trademark, but there is complex analysis going into such a determination. That is why allowing “substantially similar” to be a standard in URS and not in trademark claims is appropriate and not inconsistent. With respect to Sunrise processes, this is a very superior right (a first right to a domain name) that is not necessarily based in trademark law. Thus, limiting mandatory protection to identical match, at least until the system can be tested in practice and reviewed, is an appropriate limitation. ICANN’s Governmental Advisory Committee recently stated that mandating protection beyond identical match is something that can be placed in abeyance pending review after new gTLDs have been in operation.

Comments continue relating to the proof of “use” requirement. Some still question whether proof of use is needed to support Trademark Claims – the answer is no. Proof of use of a trademark is not required in order to receive notice in a trademark claims service.

The proof of use required to receive Sunrise protection has been extensively discussed, debated and considered with the community. Everybody recognizes that it is important to
protect business interests and especially intellectual property owners. A sunrise registration opportunity, or first right to exclude all others, is creating a powerful protection mechanism. One must not be allowed, therefore, to simply register a mark without using the mark, and then be granted such powerful protection. Thus, in order to ensure that those who can exclude others from using a domain name with a trademarked term are not abusing that exclusionary ability, all trademark holders must show proof of use.

The requirement for demonstration of use is universal, no jurisdictions are favored over the other based on the level of review trademarks receive in that jurisdiction. While proof of use will not be deleted as a requirement at this stage, just as other aspects of the program, this will be reviewed after being in practice for the first round to ensure it is having the desired effect.

Some question or call for clarification as to when the date limitation of 26 June 2008 is applicable. This is the date that ICANN approved the GNSO Policy Recommendations on New gTLDs. This date limitation only applies to Sunrise protection and only to marks that have been protected by statute or treaty. Thus, all other marks that must be recognized and honored in Sunrise processes, and all marks that must be recognized and honored in Trademark Claims services, have no date limitation. There is no plan to change this limited restriction on sunrise protection, although this will be revisited to ensure the requirement is not obsolete.

**Uniform Rapid Suspension System (URS)**

**Key Points**

- Through community input including the IRT, the STI, the GAC, and the At-Large community, the URS has evolved into a rapid mechanism that will provide trademark holders a more cost-effective method for dealing with the most clear cut cases of abuse.
- Many of the protections in the URS remain substantially the same or even stronger than what was proposed by the IRT.
- All trademark holders must show proof of use before having standing to initiate a URS proceeding.
- The intent of the URS is to address the most clear-cut cases of abuse - given that directive requiring clear and convincing evidence is appropriate.

**General**

**Summary of Comments**

Support for revisions. Although it still has concerns about some of the elements of the URS, NCUC commends ICANN for many of the revisions to date—i.e. fair use provisions (5.8), appeal opportunity (12), forbidding transfer and acknowledgement of the need for review of the URS one year after its operation (14). **NCUC (Module 5, 15 May 2011)**.

The URS must be rapid per se, and ICANN is proposing a more acceptable solution in our view. If the URS is not a cheap, quick alternative, brand owners will probably be forced into expensive defensive registrations. **MARQUES/ECTA (15 May 2011)**.
URS is inadequate.
The URS is still much weaker than the version proposed in the IRT report. It does not seem to be more rapid or cheaper than the ordinary UDRP. LEGO (Module 5, 12 May 2011). Arla Foods (13 May 2011).

The URS sets the bar so high that few complainants will prevail and few trademark owners will seek to employ it. NCTA (Module 2, 13 May 2011).

The URS as currently proposed is still wanting in many respects (see, e.g., WIPO Center’s letter of 2 December 2010, www.wipo.int/amc/en/docs/icann021210.pdf). These issues are not mere details but go to the functioning of the URS both on its own terms and in relation to the UDRP. Sensible policy choices must be made to safeguard URS stability and enforceability. WIPO Center (13 May 2011).

The Board should not be picking and choosing select components of the IRT/STI recommendations that it finds most favorable. If the Board wishes to rely on the stated standard of “clear and convincing evidence” then it should reinstate the URS as developed by the IRT. IPC (15 May 2011).

More details. The process definition of the URS is broad; further operational definition is required to ensure end users enjoy a consistent, predictable and reliable experience. AusRegistry (16 May 2011).

Reduced fees for not-for-profit organizations (2.1). The URS should feature reduced fees for not-for-profit organizations and ICANN’s negotiations with the URS provider should incentivize such reduced fees. NPOC (16 May 2011).

Analysis of Comments

As an overall note, it is important to recognize the significant community efforts that went into the development and refinement of the URS. From the IRT, to the STI, to the GAC, to the At-Large, as well as overall community input, the URS has evolved into a rapid mechanism that will provide trademark holders a cost-effective method for dealing with the most clear cut cases of abuse.

Although some commend the recent revisions and improvements that have been made to the URS, others still suggest that the URS is inadequate, is weaker than what was recommended by the IRT and sets the bar too high for the URS to be effective.

Specifically, as noted in previously comment analysis, the IRT proposal was reviewed by the STI and was modified. The concept of the URS, however, has not been challenged. The proposal underwent further significant public comment, including extensive discussions with the GAC that lead to further modifications. Although some comments seem to suggest that the current proposal is much weaker as an RPM than the IRT URS proposal, many of the protections remain substantially the same or even stronger than what was proposed by the IRT. For example:

- The response time is the same - 14-days (the current version provides for a one-time extension of no more than seven days if a good faith basis exits)
- All other time frames are the same or faster than what was recommended by the IRT
• Which trademarks can be the basis of a URS claim is broader than recommended by the IRT
• The burden of proof is the same as the IRT recommendation – clear and convincing evidence
• The requirement for showing bad faith is the same as the IRT recommendation – must be registered and used in bad faith
• The fact that Examination is required even in default cases is the same as the IRT recommendation
• The time for a Panel to render a decision is limited in current URS proposal (goal of three (3) days, no later than 5 days) – there was no such limitation proposed by the IRT.
• The remedy is the same as the IRT recommendation - suspension.
• The length of suspension in the current URS proposal can be extended by a year after current registration expires – there was no such possibility of extension in the IRT proposal.
• The evil intended to be addressed is the same – clear-cut cases of abuse.

The changes that have been implemented are the result of input from numerous stakeholders and reflect an attempt to balance the rights of trademark holders with those of legitimate registrants that may happen to have registered domain names that involve a trademark from somewhere in the world.

One commenter has called for additional operational details, which are being developed as part of the call for expressions of interest for URS provider(s).

The call for reduced fees for non-profit organizations is something that the community may want to consider, but it should be recognized that the fees are already relatively low and those fees would have to be funded from some other source.

Procedures

Summary of Comments

URS Examiners.
CADNA applauds ICANN’s new specification that URS Examiners must have demonstrable relevant legal background, such as in trademark law. URS proceedings are meant to be done rapidly, so it is critical that Examiners be properly trained and suited to consider URS cases in order to deliver the correct determination. CADNA (13 May 2011). FICPI (Module 3, 15 May 2011).

In 7.2, add the phrase “from both practice and academia” after the words “relevant legal background” and add “human rights law and competition law” after the words “trademark law.” NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

In 7.3 delete the phrase “are strongly encouraged to” and replace with “must” (“URS providers must work equally with all certified examiners…”). NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).
Response Time/Word limits.
Microsoft supports the reduced word limits for both Complainants and Respondents and the shorter time periods for conducting administrative review and issuing determinations. Microsoft (15 May 2011). Hogan Lovells (15 May 2011).

It is disappointing that Sections 5.1 and 5.3 of the current URS draft do not respond to the request for restoring the STI-RT’s recommendation for a 20-day response time or for guidance on the grounds for which a 7-day “good faith” request for response extension will be granted. At a minimum, additional guidance should be provided regarding acceptable grounds for a good faith extension. ICA (15 May 2011).

NCUC is concerned with the very short deadlines afforded to the respondent, which feeds substantially to the increase of default cases. The need for speed in the URS is understood, but due process should not be sacrificed. NCUC has strongly supported a model that recognizes the different Internet experience in different parts of the world and the need to respect due process for both parties. NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

Publication of proceedings. Section 9.4 should be removed—it sounds as if ICANN with the assistance of the URS providers will be blacklisting domain names that may in the future be registered for fair and legitimate purposes. Further, and for reasons of transparency, Providers, just like in the UDRP, should publish their proceedings. NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

Bar to presenting defense. The GAC request for permanently barring individuals or entities who had five URS actions from mounting any defense in future actions against them should be rejected, as no registrant should ever be barred from presenting a valid defense in a singular case. ICA (15 May 2011).

Bar to presenting Complaint. If there can be no “five strike” provision against repeat cyber squatters under the Suspension System based on due process principles that every registrant should always be able to present a defense, then the same principles of due process dictate that every complainant should have the opportunity to be heard. IOC (15 May 2011).

Disable Internet access after initial administrative review. If the point of the URS proceeding is to address blatant abuse such as a site selling counterfeits or engaging in fraudulent phishing schemes, then the domain should not be allowed to continue to resolve to the abusive website once the proceeding is initiated and passes the initial administrative review. Instead Internet access should be promptly disabled. Coca-Cola (15 May 2011).

Initial Review. Perhaps this is already the guidebook’s intention, but the URS Examiner should receive “clear and convincing evidence” before any registrant is burdened with a claim and required to defend themselves. With the URS process so cheap to launch ($300 USD) and the penalty for misuse so light, Examiners must be certain there is a solid case to move on before registrants are even contacted or inconvenienced in any way. M. Menius (16 April 2011).

Notice (4.2). Add the word “potential” before the word “effects’ (“as well as the potential effects if the registrant fails to respond and defend against the Complaint.”) NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).
Analysis of Comments

Some have commented on the nature and requirements for the URS Examiners, including the improved specifications requiring trademark experience. Others suggest adding some additional criteria and requirements. At this stage, the added requirements shall remain as is, but will certainly be looked at after the URS has been tested in practice.

Commenters appreciate the reduced time limits as well as word limitations, while others are concerned that the time limits may be too short. The very nature of the URS calls for short time limits and efficient procedures to ensure a rapid mechanism. The level of the time limitations are in line with what the IRT recommended, with consideration paid to all other community comments, including the STI.

With respect to publishing URS Determinations, it is agreed that Providers should publish their Determinations. The editorial comments in section 9.4 of the URS that the URS determinations will be published “in order to provide notice to the next potential registrant” will be deleted because it may seem like a “blacklist” as suggested by one commenter (and good practice calls for such comments to be omitted from procedural documents).

The Applicant Guidebook is in line with the comment suggesting that no bar should be set prohibiting a respondent from presenting a defense. With that, a separate commenter suggests that if respondents are not barred, then no complainant should ever be barred. There is a key distinction between two. The complainant has other avenues in which to seek redress from an alleged infringer. If a URS proceeding is initiated against a respondent, however, it must have the opportunity to respond or fear losing control of what might be a legitimate, non-infringing domain name.

One commenter suggests that simply passing the administrative review should be enough to cause the challenged domain name to be suspended. The whole purpose of the URS, however, is to have a fair evaluation on the merits, but in an expedited manner so that true cases of abuse can be brought to an end quickly. The URS should not be a mechanism where the burden of proof shifts from the complainant to the respondent at the outset.

Another commenter seems to suggest that one must actually be deemed to have submitted “clear and convincing” evidence before the respondent is even brought into the proceedings. Such a threshold requirement in a rapid, low-cost process would not be efficient. Only a URS Examiner can determine if clear and convincing evidence has been presented. The cost of the proceedings would be prohibitive if the Examiner had to separately analyze the complaint, make a determination on the existence of sufficient evidence, and then had to again examine the evidence in light of the response.

The comments suggesting that the word “potential” be added in section 4.2 (“the potential effects if the registrant fails to respond and defend against the Complaint) has been followed and will be included in the 30 May 2011 URS proposal.

Standards, Burden and Evaluation

Summary of Comments

Proof of use.
Proof of use should not be a requirement for participation in the URS. In a majority of countries, trademark rights arise through registration and not use. Moreover, requiring a showing of use in the URS would go well beyond the criteria purposefully mirrored from the UDRP. *INTA (14 May 2011)*.

Proof of use should not be a requirement for URS. Requiring proof of use presumes that the URS provider will be qualified to meaningfully examine that evidence of use and such a presumption is not realistic. If a complainant wanted to rely on proof of use previously submitted to and validated by the Clearinghouse, how recent must such a submission be? *Microsoft (15 May 2011)*.

Given some concern exists over the proof of use, ICANN should consider carefully whether to move forward in establishing this requirement. *USCIB (15 May 2011)*.

**Burden of proof.**

The URS has the same legal requirements as a UDRP but a substantially more onerous standard of proof which is inconsistent and unwarranted under the URS as currently proposed. *INTA (14 May 2011)*.

IACC supports the GAC position that the burden of proof should be “preponderance of the evidence.” *IACC (15 May 2011)*.

The GAC request to lower the standard of proof should be rejected as this would erode critical distinctions between the URS and the UDRP. *ICA (15 May 2011)*.

IPC urges stakeholders to consider the IPC’s compromise position that would properly deter registrants from cyber squatting and lower costs for rights holders: the IPC proposes shifting the burden of proof to the Respondent in a URS proceeding when the Respondent has lost 5 or more URS proceedings. *IPC (15 May 2011)*.

**Bad faith.**

The GAC request for removal of the requirement that a complainant establish registrant bad faith should be rejected as this would result in a URS having a critical evidentiary element that is lower than the UDRP requirements. *ICA (15 May 2011)*.

Bad faith should remain a requirement upon the same standard as set in the UDRP. *USCIB (15 May 2011)*.

ICANN has refused to change the “bad faith” standard in the URS and also added factors, not proposed by the IRT, that all but decide in favor of the respondent a substantial number of URS cases that could be brought. If the URS is supposed to be modeled on the UDRP ICANN should not adopt rules that fly in the face of decisions under the UDRP. *NCTA (Module 2, 13 May 2011)*.

**Trademark + Keyword Cases**

The GAC request to expand the URS to “trademark + keyword” cases should be rejected as these are not the “slam dunk” cases the URS was purportedly designed to address. *ICA (15 May 2011)*.
ICANN should either bring “exact trademark + goods/services/other generic words” within the scope of the URS or acknowledge that “exact trademark + goods/services/other generic words” domain names are confusingly similar to the trademark. NCTA (Module 2, 13 May 2011).

Fair use (5.8.1). Delete “and the Registrant is making fair use of it” in this section. The phrase is not necessary—a domain name that is generic or descriptive cannot raise trademark claims whether the use is fair or not. NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

Evaluation.
We support the GAC recommendation that the URS apply to registrations that are identical or confusingly similar to protected marks as well as terms associated with goods and services. News Corporation (13 May 2011). INTA (14 May 2011).

URS Examiner decisions should be based on the evidence actually presented only, not based on the evidence “available” to an Examiner. Examiners should not be conducting independent investigations for information that is “available” to them. INTA (14 May 2011). Microsoft (15 May 2011).

In 5.9.1 change the phrase from “Examiner will review each case on its merits” to “Examiner must review each case on its merits.” NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).

Scope. FICPI commends the revision to 1.2.6.1 accepting all officially registered trademarks. FICPI (Module 3, 15 May 2011).

Analysis of Comments

Some continue to question the requirement that a trademark holder show proof of use of a trademark that is the basis of a URS proceeding. The proof of use required to be the basis for a URS proceeding (as well as for the PDDRP and protection in Sunrise procedures) has been extensively discussed, debated and considered with the community. In order to ensure that those who can exclude others from using a domain name with a trademarked term are not abusing that exclusionary ability, all trademark holders must show proof of use before having standing to initiate a URS proceeding. This requirement will not be changed at this juncture, but as other aspects of the program, this will be reviewed after being in practice for the first round to ensure it is having the desired effect. The requirement for demonstration of use is universal, no jurisdictions are favored over the other based on the level of review trademarks receive in that jurisdiction.

Commenters continue to push for lowering the burden of proof while others oppose doing so. Still another group suggests that the burden should shift to the respondent after five failed defenses to a URS proceeding. Neither the level nor the party on whom the burden rests will be changed. The intent of the URS is to address the most clear-cut cases of abuse. The IRT stated that contestable issues are not appropriate for URS resolution. (See page 34 of final IRT Report located at http://www.icann.org/en/topics/new-gtlds/irt-final-report-trademark-protection-29may09-en.pdf). Given that directive, requiring clear and convincing evidence is appropriate.
It appears that all commenters agree that the bad faith requirement in the URS should remain as is so as to ensure the URS’ connection with the UDRP and not to make any decisions that fly in the face of the UDRP. Accordingly, no further analysis is required on this point.

One group notes that trademark + keyword cases should not be adopted, but another notes that it should be adopted or that ICANN should declare that a trademark + keyword is confusingly similar to the trademark alone. Trademark + keyword will not be adopted and there will be no declaration that such would be confusingly similar to the trademark at issue. However, terms that are confusingly similar to the trademark, will be afforded consideration in the URS. Each URS proceeding should be considered by an experienced and qualified Examiner whose job it will be to determine if a challenged domain name is identical or confusingly similar to the trademark at issue. ICANN is not qualified to make sure a determination.

No changes will be made in response to the comment calling for a revision to section 5.8.1 (“and the Registrant is making fair use of it”). This is merely an example of a defense and is not meant to be exhaustive or even required.

There is a comment that the URS should apply to domain names that are identical or confusingly similar to the trademark at issue - this is always how the URS has been proposed.

With respect to the evidence available to Examiners, the Examiner may look to the evidence presented by complainant as well as other evidence, if available. Although, nothing requires the Examiner to review evidence other than what is presented by the parties.

The particular suggestion for a word change: “Examiner will review each case on its merits” to “Examiner must review each case on its merits,” shall be implemented.

The final comment is simply recognition and approval of revisions. Accordingly, no analysis is required in that regard.

Default and Appeals

Summary of Comments

Time to seek Relief from default.
In the newest version of the URS, a registrant will have six months to appeal a judgment after a default. A shorter time period, such as sixty to ninety days, would be more appropriate. *AIPLA (13 May 2011). Partridge (14 May 2011).*

The period should be shortened to 90 days or the expiration of the domain, whichever is shorter. Even with the latest time frame reduction, tracking and management of these default cases will be unduly burdensome for corporate legal departments and directly conflicts with the URS’s intended cost-effective and expedited approach. *IACC (15 May 2011).*

The period should be no longer than 120 days given the URS raison d’etre. *Hogan Lovells (15 May 2011).*

We are pleased that ICANN shortened the time allotted for appeal from two years to six months. *News Corporation (13 May 2011).*
There is no justification for allowing as long as six months for a dilatory response, particularly for what is supposed to be a quick and streamlined remedy, but the reduction from two years to six months is a significant improvement. *NCTA (Module 2, 13 May 2011).*

Respondent should not be permitted to obtain an additional 6-month extension (beyond the initial 6 months) in which to seek review of a decision in a default case. The likelihood that a respondent with legitimate rights or interests in the disputed domain name(s) actually needs more than 6 months to seek this review is virtually nonexistent. After all, a respondent with a legitimate claim to registration and use of the disputed domain name(s) will have tremendous incentive to seek review almost immediately after decision. *Microsoft (15 May 2011).*

Even with the reduction in the time for registrant appeal in default cases, any registrant who believes he has been the victim of a wrongly decided URS should have sufficient time to obtain a de novo appeal. *ICA (15 May 2011).*

**Appeal.**

INTA appreciates and supports the clarification by ICANN that appellants must identify specific grounds for appeals. *INTA (14 May 2011).*

IPC supports the GAC’s position that as every appeal will be decided de novo, that the appeal process not require a separate evaluation of the rationale. *IPC (15 May 2011).*

USCIB agrees with the GAC on the issue of de novo review. One cannot seek de novo review from the same body that made the URS determination. Therefore, the standard for appeal in the URS should be the same as in a UDRP where an appellant seeks de novo review in court, not with the UDRP provider. If the URS carries over the criteria of the UDRP it should also use the appeal process. *USCIB (15 May 2011).* *IPC (15 May 2011).*

**Support for removal of possible defense language.** Deletion of the requirement that URS panelists consider in default cases if there was a possible defense that could have been submitted by the Respondent is a huge improvement. *Hogan Lovells (15 May 2011).* *NCTA (Module 2, 13 May 2011).*

**Analysis of Comments**

There are still comments about what many refer to as the time to appeal after default. To clarify, no matter what, the time to file an appeal is no more than 14 days after a URS Examiner’s Determination is issued. What has recently been changed is the time in which a defaulting respondent can seek relief from default. This time period was decreased from the initial suggestion of two years, down to six months with an option if good cause exists to extend for an initial six months. The six-month time period is a balance between the calls for a shorter time by trademark interests and the GAC and the calls for a longer time period so that legitimate registrants will have the opportunity to respond even if they initially failed to do so. Either way, it should be noted that unless the defaulting respondent prevails after seeking relief from default, the domain name will remain in suspended status.

With respect to appeals, one commenter supports the clarification made requiring an appellant to identify the specific grounds on which an appeal is filed while others suggest that an appeal should only be made to a court and not to the URS provider. The appeal mechanism was developed and included by the STI as a check and balance of sorts to ensure that legitimate
registrants had a voice and were not improperly overshadowed by trademark holders. It will remain as part of the URS, pending a review of the URS after it has been tested.

One commenter notes the improvement resulting from the removal of the reference to a URS Examiner considering “possible defenses.” No analysis is required in response to this comment.

Remedies and Fee Shifting

Summary of Comments

Transfer/First Right of Refusal.

If the URS determination is in favor of the complainant, the complainant should have the right of first refusal for the transfer of the disputed domain name(s) after the suspension period expires. NPOC (16 May 2011).

AIPLA is concerned that a lock on the domain name is the only remedy available to a URS complainant. Greater consideration should be given to allowing the complainant the option of obtaining the domain name after the appeal period has ended. This would avoid unnecessary time and expense to seek further relief in court or via the UDRP. AIPLA (13 May 2011). Partridge (14 May 2011).

We are pleased that the latest version of the URS does not include a transfer option and urge that the UDRP remain the sole means by which a complainant can obtain possession of a disputed domain. If this issue should again arise ICA urges that the concerns of registrants and complainants be accommodated by the win-win approach of placing suspended domains on a permanent ineligible for re-registration list. ICA (15 May 2011).

A successful URS complainant should have the right to cancel the domain or to obtain control of the domain (except in specialized gTLDs), or that the URL resolve to an error notification to avoid the possibility of causing damage to the goodwill associated with the trademark contained in the URL. ICANN’s proposal that the remedy be that the URL resolves to a website that is an informational page about URS removes control of the trademark in the URL from the trademark owner. Consumer confusion when following the URS to a site not associated with the trademark owner raises the possibility that the goodwill associated with the trademark will be damaged. IBM (13 May 2011).

Support for loser pays model.

The “loser pays” model is welcome and we would have liked the model to be more widely available. MARQUES/ECTA (15 May 2011).

IACC supports the GAC position on including a “loser pay” provision. IACC (15 May 2011).
The limited loser pays model is to be applauded for targeting cyber squatters, but it is unclear if 25 is an appropriate number; this should be explained. Hogan Lovells (15 May 2011). UrbanBrain (16 May 2011).

If the limited loser pays mechanism is retained, there should be no reduction in the number of domains giving rise to the requirement. ICA (15 May 2011).

There is no loser pays mechanism which would be essential in a URS, or even a fee for filing a response to a complaint. The addition of a limited “loser pays” model if the complaint lists 26 or more domain names does not make any sense. There is no justification for the number 26 and a loser pays mechanism should be a general mechanism, not one that will not realistically have any effect. LEGO (Module 3, 12 May 2011). Arla Foods (13 May 2011). BBC (Module 5, 13 May 2011). NCTA (Module 2, 13 May 2011).

The threshold for “loser pays” must be lowered to be somewhere between 5-10 domain names. If the more than 25 domain name cut off is implemented, cyber squatters will simply make registrations in batches of 25 per fictitious registrant name, enabling them to continue to profit from bad faith use of domain names until caught. Time Warner (14 May 2011). INTA (14 May 2011). USCIB (15 May 2011).

The loser pays model should apply to any situation where the registrant has filed for 5 or more domain names, and the Response Fee must be equivalent to the filing fee charged to the Complainant. IPC (15 May 2011).

The threshold should be reduced to 8 or more disputed domain names; 26 is exceptionally high for the standard of complaint set by the URS. NPOC (16 May 2011).

The “loser pays” threshold should be reduced from at least 26 domain names to 10 domain names. Microsoft (15 May 2011).

BC members’ real world experience suggests that a more practical figure for the “loser pays” threshold would be 15. BC (15 May 2011).

The limited loser pays figure of 26 domain names is arbitrary. AIM proposes the following for 2.2: “A limited ‘loser pays’ mechanism has not been adopted for the URS. Complaints listing fifteen (15) or more disputed names will be subject to [a] Response Fee which will be refundable to the prevailing party.” AIM (Module 5, 12 May 2011).

The NCUC is concerned that the limited loser pays model ICANN is proposing will feed into the existing culture of trademark bullying and will be abused by trademark owners who will seek to intimidate legitimate registrants. In addition the provision is open to interpretation (e.g. it is unclear if the 26 domain names will have to be registered by one single registrant or the Complainant will have the ability to activate this provision if he manages to identify 26 domain names incorporating his trademark which are registered by a multitude of registrants). The phrase “against the same registrant” should be added to clarify this issue. The URS lacks the checks and balances found in traditional means of adjudication that uses a loser pays model. In the URS the loser pays model will provide room for gaming of a model that is only meant to be limited to very specific cases. NCUC (Module 5, 15 May 2011). A. Gakuru (Module 5, 16 May 2011).
Remedies for abuse of URS process. The penalties outlined in the new gTLD guidebook are not sufficient regarding misuses of the URS process and will not deter abusive complaints. A one-year bar from URS use is monumentally inadequate, particularly in lieu of the paltry $300 fee required for launching a URS claim. There should be a substantial financial penalty and permanent ban (on first attempt) for any complainant found to have used the URS without cause. M. Menius (16 April 2011).

Analysis of Comments

Several comments relating to remedies under the URS have been received. Some argue that transfer, rather than suspension, or first right of refusal after suspension period concludes, should be the ultimate remedy. While others suggest that suspension is the right remedy for the URS. This topic has been widely discussed and debated. The IRT proposed suspension, not transfer. The STI did not alter this remedy. Since the URS is intended to be a prompt mechanism dealing with clear cut cases of abuse, the remedy reflects the evil that this RPM is designed to prevent. There was significant community support for the suspension, not transfer, remedy in public discussion in the San Francisco meeting. Recall, however, that the complainant will have the right to extend the registration, and thus the suspension, for an additional year after the initial registration period expires. This extension provides an option for the domain name to be suspended even longer than the period recommended by the IRT.

Many have commented on a loser pays models. Some applaud the inclusion of the limited “loser pays” model, although some still think it needs to be further enhanced by lowering the number of domain names at issue needed in order to require a “Response Fee.” Others have commented that no changes should be made at this point while still others are concerned that any loser pays model will be manipulated by trademark holders. As is evident, there are numerous and varying views on whether a loser pays model is appropriate. In an effort to address and balance all of the competing concerns, a limited loser pays model requiring a ‘Response Fee” when a single complaint involves 26 or more domain names, has been adopted. Note that the Response Fee will be refundable if the respondent prevails in the URS proceedings. Further, it has been made clear that the Response Fee shall not exceed the URS Filing Fee. There are independent concerns that administration of loser pays will result in higher URS fees. That issue will be discussed with potential URS providers.

While some suggest that the number 26 or more domain names may seem somewhat arbitrary; so too would any other specific number that has been suggested. Thus, since the IRT as a self-identified group of 18 individuals representing those with trademark interests recommended 26, that is the number that has been adopted. The clarification that the 26 or more domain names must be as to the same registrant has been made as suggested.

One commenter suggests that the remedies for abuse of the process are not nearly sufficient to deter bad behavior. The remedies adopted were put in place to balance the possibility that trademark holders would use (or abuse) the URS, a relatively low cost mechanism, to constantly put legitimate domain name holders on the defensive. This is a new mechanism and any suggestion of a permanent ban, as this commenter makes, must be considered very carefully before implementing.
Notwithstanding any of the above, note that a full review of the URS, including the remedies adopted, is intended after the first round of new gTLDs has been completed and the URS has been tested.

Post Delegation Dispute Resolution Procedure (PDDRP)

Key Points

- Given the severe nature of the remedy in this procedure, and given that generally, registries have no privity of contract with the registrant, the burden of proof of clear and convincing evidence is appropriate.

- In order to ensure that those who can exclude others from using a domain name with a trademarked term are not abusing that ability, all trademark holders must demonstrate “use” before having standing to initiate a Trademark PDDRP proceeding.

General

Summary of Comments

Call for long-term, positive collaboration. Beyond positions already on record, little can be said about ICANN stakeholders’ reluctance to engage in constructive discussion of substantive criteria and safe harbor consideration factors. Yet, it would seem illusory to expect rights holders to continue to turn exclusively to lower-level enforcement options in a vastly expanded DNS. The WIPO Center is pleased that ICANN has taken up its suggestion for establishing a PDDRP in the first place. However, intermediary financial gain from registration activities that infringe third party rights comes with appropriate responsibility. This should be a time for positive collaboration in a longer-term view. WIPO Center (13 May 2011).

PDDRP is too weak.
The PDDRP continues to contain a number of provisions that severely and perhaps fatally weaken its effectiveness to potential complainants, raising concern that unless changes are made potential complainants will elect to forego the PDDRP entirely and pursue their grievances in civil courts. This would defeat the point of creating the PDDRP. INTA (14 May 2011).

The PDDRP has been revised so extensively and in accordance with the wishes of the Registry Stakeholder Group that Microsoft questions its utility as an RPM. ICANN should implement the PDDRP format as outlined in the IRT Final Report. Microsoft (15 May 2011).

Standards and Burden

Willful Blindness.
The PDDRP still fails to capture recurring circumstances of willful blindness. To limit the scope to affirmative conduct and to exclude willful blindness will considerably reduce the benefit of the PDDRP and encourage situations where a party sticks its head in the sand to seek to avoid liability, as is too often the case. Hogan Lovells (15 May 2011). NCTA (Module 2, 13 May 2011).
**Burden of proof.**
While IACC supports the majority of Trademark PDDRP provisions, it shares the GAC’s concerns regarding the requirement that Complainants prove systematic infringement or improper conduct by clear and convincing evidence. ICANN should reconsider this and lower the standard to preponderance of the evidence. The Trademark PDDRP can be likened to a civil action for contributory trademark infringement or unfair competition, under which a plaintiff need only prove wrongdoing by a preponderance of the evidence. Requiring a PDDRP complainant to meet the lower standard is sufficient to meet the goals of the Trademark PDDRP and will not unfairly prejudice a registry operator. *IACC (15 May 2011)*.

To balance the generally watered down RPMs adopted by ICANN in the current version of the applicant guidebook, the PDDRP standard of proof in Section 6 should be “preponderance of the evidence.” *IPC (15 May 2011). NCTA (Module 2, 13 May 2011)*. 

The PDDRP contains unrealistically high burdens of proof at both the first and second level. The levels of proof exceed showing bad faith (must show “specific bad faith”) and a pattern or practice of bad faith (must prove “substantial pattern and practice” by clear and convincing evidence. Even if a complainant wins, there are no sanctions against a registry and no corresponding duty by ICANN to investigate or sanction the registry. *BC (15 May 2011)*.

**Proof of use.**
Proof of use should not be required. *IPC (15 May 2011)*.

FICPI positively notes with respect to clause 9, “Threshold Review”, that all registered trademarks, independent of the national or regional registration system, are accepted, and therefore FICPI can accept the new regulation that the trademarks have to be in “current use.” *FICPI (Module 3, 15 May 2011)*.

**Vertical integration.** Further clarification is still required—section 6 should be revised to provide that vertically integrated registries may not attempt to shift blame for second-level bad faith actions to the registrar. *IPC (15 May 2011)*.

**Support for revisions.** FICPI supports the revisions made to Sections 6.1(a) and 6.1(b), as well as 6.2(b) (ii) and (iii) deleting the words “unjustifiably” and “impermissible,” therewith creating stronger trademark owner protection. *FICPI (Module 3, 15 May 2011). NCTA (Module 2, 13 May 2011)*.

**Procedures**

**Notice.** The section 7.2.3(d) requirement that the complainant must notify the registry operator at least 30 days prior to filing a complaint is unduly burdensome; the notice period should be reduced to 10 days. A registry operator does not need 30 days for an investigation and it seems more likely than not that the registry operator would use the extra 20 days to initiate preemptive litigation. *IPC (15 May 2011)*.

**Filing fee—registry operator.** ICANN should reinstate in Section 10 the requirement that the registry operator pay a filing fee when submitting its response so that the complainant and registry operator share costs during the proceeding, maintaining the practice of refunding the costs paid by the prevailing party at the end of the proceeding. Without a mechanism for both
parties to pay up front in place, the process of refunding fees to the prevailing party will be hampered. *IPC (15 May 2011).*

**Define fees and costs.** Fees and cost ranges in Section 14 should be defined more clearly no later than the release of the final applicant guidebook to assist with budgeting for the possibility of a PDDRP complaint. *IPC (15 May 2011).*

**Remedies**

*ICANN discretion.* CADNA would like more clarification on the implication that ICANN is allowed to impose a remedy other than what was recommended by the expert panel and in what cases. CADNA also seeks clarification on what qualifies as the “extraordinary circumstances” that enable ICANN to impose a remedy not in line with what is recommended by the expert panel and what such remedies would entail. *CADNA (13 May 2011).*

**Section 18.1 clarification.** This section should be clarified regarding exactly how suggested remedies may differ if the registrant is found to be under the ultimate control of the registry operator, i.e., whether in this case the second-level domain name registrations may be recovered by the PDDRP complainant or disabled. *IPC (15 May 2011).*

**Registry operator challenge to remedy under arbitration provision.** Section 21.4 should be revised to provide explicit assurance that ICANN may implement the remedy once arbitration has been concluded if the PDDRP has been upheld. Without such assurance, a registry operator may be able to bypass any unfavorable decision recommending a remedy by initiating arbitration, thus drastically limiting the PDDRP’s usefulness. *IPC (15 May 2011).*

**Analysis of Comments**

As noted in prior comment analysis, not all suggested revisions have or could have been included in the PDDRP as some were either not implementable or were directly at odds with each other, thereby requiring some balancing of interests. All comments have all been carefully considered in the development of the implementation details of the PDDRP, even if not implemented.

One commenter calls for long-term collaboration on the PDDRP while others question its effectiveness as currently drafted. Community-wide collaboration has been part of the entire development process. Furthermore, ongoing collaboration is contemplated and will be welcomed as the implementation of the new gTLD program and its dispute resolution mechanisms are developed and reviewed after the first round of applications. Ongoing enhancement and improvement of the PDDRP is certainly contemplated and will, as always, be based on overall community input.

One commenter continues to call for inclusion of willful blindness as a standard for finding registry liability while others continue to suggest that the burden of proof be lowered. As set out in the latest version of the Trademark PDDRP proposal and set forth in the last version of the PDDRP Comment Summary and Analysis, willful blindness is not and properly should not be included as part of the standard under which the registries will be reviewed. The portion of the trademark PDDRP that can hold a registry liable for infringement at the second level is a large step in providing trademark protections. It must be done carefully. Registries do not have a
direct interface to customers; that happens at the registrar level. Registries maintain the database. In any large registry there might be a relatively large number of infringers even if the registry is fulfilling all its duties; the registry may be aware of some of them but will also be unaware of others. To hold registries accountable for all instances of infringement would have unknown effects on the ability of the registry to conduct business.

The registry should, however, be liable for its affirmative conduct resulting in infringement of trademarks; the standards for the PDDRP are crafted to achieve that goal. Accordingly, while some may still think that the standard should include willful blindness, or some derivative of willful blindness, or that the burden of proof should be lowered, there is no plan to make those changes. There are many other avenues that can be employed to pursue registrants that are infringing trademarks.

Given the nature of liability on a registry, that generally has no privity of contract with the registrant, the burden of proof of clear and convincing evidence is appropriate.

One group representing intellectual property interests still suggests that proof of use should not be required, while another group representing intellectual property interests now accepts this proof of use requirement given that trademarks from all jurisdictions are treated equally. The proof of use required in a PDDRP proceeding (as well as for the URS and protection in Sunrise processes) has been extensively discussed, debated and considered with the community. In order to ensure that those who can exclude others from using a domain name with a trademarked term are not abusing that ability, all trademark holders must show proof of use before having standing to initiate a Trademark PDDRP proceeding. This requirement will not be changed at this juncture, but as other aspects of the program, this will be reviewed after being in practice for the first round to ensure it is having the desired effect. The requirement for demonstration of use is universal; no jurisdictions are favored over another based on the level of review trademarks receive in that jurisdiction.

One commenter suggests that section 6 needs revision to ensure that vertically integrated registries may not attempt to shift blame for second-level bad faith actions to the registrar. The definition of registry operator in section 6 does just that:

For purposes of these standards, "registry operator" shall include entities directly or indirectly controlling, controlled by or under common control with a registry operator, whether by ownership or control of voting securities, by contract or otherwise where ‘control’ means the possession, directly or indirectly, of the power to direct or cause the direction of the management and policies of an entity, whether by ownership or control of voting securities, by contract or otherwise.

No further revisions are necessary at this time.

One group suggests that requiring 30 days advance notice to the registry operator before bringing a PDDRP is unduly burdensome. The current requirement is in place to provide the registry with a reasonable amount of time to investigate and take appropriate action if a trademark holder notifies the registry that there may be infringing names in the registry. This notice requirement was further discussed with the GAC, which has now accepted this requirement. In light of all of the community discussions on this topic, the timing of this notice requirement will not be revised.
With respect to fees, one group comments that the registry operators should be required to pay PDDRP fees up front, noting that without a mechanism in place for both parties to pay up front, the process of refunding fees to the prevailing party will be hampered. However, registry operators will be required to comply with the PDDRP, including the prevailing party determination. Failure to comply, including reimbursing a successful PDDRP complainant for all provider and panel fees, will be deemed a breach of the registry agreement. Thus, the registry operator will be subject to all available remedies under the agreement for breach, up to including termination. Accordingly, there appears no need to revise the fee provisions. This same commenter requests that additional detail be provided relating to the amount of fees for budgeting purposes. Such details will be forthcoming as the PDDRP mechanism is tested. As noted in the Applicant Guidebook, such fees are intended to be reasonable, and will of course be subject to review after being in practice to ensure the fees are not prohibitive. One reminder, however, the prevailing party will get its money back.

Some seek clarification with respect to remedies, and when they might deviate from those recommended by the Expert Panel. As suggested by the GAC, the PDDRP has been revised to note that “[i]mposition of remedies shall be at the discretion of ICANN, but absent extraordinary circumstances, those remedies will be in line with the remedies recommended by the Expert Panel.” Any deviation will be based on ICANN’s understanding of the particular circumstances, but with the ultimate goal of protecting registrants. To the extent a recommended remedy may provide risk to innocent registrants, ICANN must take that into consideration when imposing any such a remedy.

In that same vein, section 18.1 of the Trademark PDDRP notes that a recommended remedy may not call for deletion, transfer or suspension of a domain name, unless “registrants have been shown to be officers, directors, agents, employees, or entities under common control with a registry operator.” If the PDDRP Panel finds such connection, then it is free to recommend such remedies relating to the domain name, a recommendation that ICANN will then have the discretion to consider.

Finally, one commenter suggests that section 21.4 of the Trademark PDDRP be revised to provide assurance that ICANN may implement the remedy once arbitration challenging a ICANN remedy has been concluded if presumably found in favor of ICANN. Such clarification, however, is already found in section 21.3:

> [ICANN], will not seek to implement the remedy for violation of the Trademark PDDRP until it receives: (i) evidence of a resolution between the Complainant and the registry operator; (ii) evidence that registry operator’s lawsuit against Complainant has been dismissed or withdrawn; or (iii) a copy of an order from the dispute resolution provider selected pursuant to the Registry Agreement dismissing the dispute against ICANN whether by reason of agreement of the parties or upon determination of the merits.

Accordingly, while this comment did lead to a couple of minor clarifying revisions, no additional revisions are required to address the overall comment.

**REGISTRY RESTRICTION DISPUTE RESOLUTION PROCEDURE (RRDRP)**
Key Points

- If a registry is affirmatively participating in infringing conduct, the PPDRP is the proper dispute resolution mechanism to use. If there are simply names in a registry that violate the restrictions of the registry agreement, whether infringing or not, then the RRDRP is the proper mechanism to invoke.

Summary of Comments

RRDRP is ineffective and biased toward registry operators. Potential complainants must not be required to first file a claim through the Registry Restriction Problem Report System. The WPDRS, on which the RRPRS is clearly based, has not historically been effective. There is no reason to think that such a system will be effective here. It is arbitrary and unfair to prohibit RRDRP complainants from filing PDDRP complaints relating to the same facts or circumstances. Each DRP is intended to deal with different harms, but ICANN’s tying them together in this matter bears the imprimatur of the Registry Stakeholder Group which has succeeded in rendering both DRPs ineffectual. In their current form neither the RRDRP nor the PDDRP is properly balanced and both clearly favor registry operators. Microsoft (15 May 2011).

Analysis of Comments

One commenter objects to a prerequisite of submitting a Registry Restriction Problem Report before an RRDRP claim can be filed. This was made a prerequisite, however, to help avoid, if possible, the more costly and time-consuming mechanism of the RRDRP. The idea was to provide registry operators, who have agreed via contract to certain registry restrictions, the opportunity to cure possible breaches simply by providing them with information about potentially violating names in the registry.

This same commenter questions the prohibition on the use of both RRDRP and PPDRP simultaneously. But, if a registry is affirmatively participating in infringing conduct, the PPDRP is the proper dispute resolution mechanism to use. If, on the other hand, there are simply names in a registry that violate the restrictions of the registry agreement, whether infringing or not, then the RRDRP is the proper mechanism to invoke. Further, for those infringing names simply in a registry, the UDRP and now the URS will be available as alternate dispute resolution mechanisms for trademark holders.

PRE-DELEGATION OBJECTION PROCEDURES

Key Points

- ICANN funded objections: beyond one funded objection per government, each request for funding will be analyzed on a case-by-case basis depending on the particular facts and circumstances.

- The time limitations set out in the Applicant Guidebook for GAC Advice are meant merely to clarify that “for the Board to be able to consider the GAC advice during the evaluation process, the GAC advice would have to be submitted by the close of the
Summary of Comments

Fees.
Applicants should not be required to pay a Response Filing Fee in order to defend the rationale already included in their original application. BC (15 May 2011).

The description of the process and the objection filing fee is not very accurate in the Discussion Draft, so it becomes uncertain what the costs of objections are. The amounts shown in table 7 of the explanatory memo “Discussion Draft: Exemptions to Objection Fees for Governments” shows an estimated total cost of US$58K for “community” objection and US$124K for “limited public interest” objection. These sums are prohibitive for most organizations or communities. It is very important to have a well described, low-cost possibility to file an objection, especially as a community. DIFO (15 May 2011).

ICANN’s guarantee of funding for advance payment of costs and for a minimum of one objection per government will relieve concerns of some smaller governments who might have expressed concerns about the cost of objection filing fees. CADNA would like more information on what will happen for subsequent objections and in which cases ICANN would be willing to provide the funds for other objection filing fees. CADNA (13 May 2011).

Protection of all geographic names should be the first priority. The GAC early warning does not meet our demand. Geographic names are important public property. Governments will have to file objections to prevent misuse and abuse of them. There should be an exemption from objection fees for governments regardless of the number of objections that a government files. Tokyo Metropolitan Government (13 May 2011).

GAC Advice.
(3.1)–RySG supports the fact that the process of considering GAC Advice is planned to happen without causing delays to the evaluation process. What happens if the GAC reaches consensus to oppose a string without a sound global public policy basis? (item 5) Is it correct to conclude that if GAC consensus opposes a string and there is no remediation of the opposition then a string will be denied automatically? (item 8) What does “[t]he receipt of GAC advice will not toll the processing of any application” mean? Does it mean that the GAC will not be charged a fee for objecting? RySG is concerned that the GAC’s definition of consensus could lead to a single country having de facto veto power over new TLDs. If GAC consensus is defined, at a minimum, as only one country opposing where no other country objects to that opposition, it appears that it could in practice be a unilateral veto. RySG (15 May 2011).

(3.2)–Regarding the statement that the independent dispute resolution process does not apply in cases of GAC advice, does this mean that the GAC may submit advice on any topic and is not restricted to the four enumerated grounds in Section 3.2 (i.e., string confusion, rights protection, limited public interest, community)? Or does it mean that the GAC does not have to follow the procedures for dispute processes for any of the four areas? It is assumed that it is the former, but this should be clarified. RySG (15 May 2011).

Independent Objector (3.2.5).
Is it correct that the Independent Objector (IO) may not consider comments received after the comment period? RySG (15 May 2011).
ICANN should provide additional information regarding the role of the IO regarding IO selection, support, application review and the decision whether or not to object. *NPOC (16 May 2011).*

**Expert Panel.**
If at least one of the parties to a dispute is willing to pay for a 3-member panel, they should be given that option. *RySG (15 May 2011).*

If a decision is not posted in full, will the parties to the dispute be given the full documentation of the decision? (see also Attachment to Module 3, New gTLD Dispute Resolution Procedures, Article 21(g)). *RySG (15 May 2011).*

**Dispute resolution provider—ICC.** According to page 8 in Module 3, the ICC still serves as the dispute resolution service provider (DRSP) for the limited public interest and community objections in the guidebook. Grounds for these objections include “incitement to or promotion of violent lawless action…discrimination based on race, color, gender, ethnicity, religion or national origin…child pornography” etc. These areas are obviously out of the scope and expertise of the ICC. The ICC’s neutrality and global representativeness as a public interest DRSP or community DRSP would be questionable. More representative and more neutral authorities should be introduced to take on the duty of DRSP for public interest and community objections. *Internet Society of China (27 May 2011).*

**Limited public interest objection—International law.** In module 3, section 3.5.3, one of the limited public interest objection adjudication criteria is to “determine the applied-for gTLD string be contrary to specific principles of international law as reflected in relevant international instruments of law.” For historical reasons, countries around the globe have different laws and legal definitions of various matters (e.g. pornography). If the limited public interest objection is judged only by international law principles, it is very likely to approve some gTLDs while conflicting with the laws of some countries, which is obviously inappropriate. It is suggested that compliance with the limited public interest objection principles be determined according to both the principles of international law and the laws of each nation-state. *Internet Society of China (27 May 2011).*

**Publication of objections.** Microsoft supports the planned publication of all filed objections. *Microsoft (15 May 2011).*

**English language requirement.** The requirement in Module 3, page 11 to use English for the text of submitted objections disparages non-English-speaking communities in use of their own languages following objection proceedings to defend their interests and is inconsistent with ICANN’s commitment to multi-lingual process and procedure. As one of the world’s most widely used languages and as an official U.N. language, Chinese should also be a language for the text of objection. *Internet Society of China (27 May 2011).*

**Community Objection.**
Microsoft supports the revision to the community objection standard. *Microsoft (15 May 2011).*

The revised standard in the discussion draft in section 3.5.4 is much more appropriate and realistic. *COA (15 May 2011).*
Remove cumbersome, unnecessary requirements. Module 3, page 23 requires the party who raises the objection to prove that a considerable number of community members have objection views. In China, a permanent community organization has its own operational rules and procedures. While the permanent organization is established for community service, the views represent the views of all community members. It is recommended to reduce the relevant aspects of community opposition procedures which are cumbersome and unnecessary requirements. Internet Society of China (27 May 2011).

Analysis of Comments

Several comments about fees have been received. These comments include: a suggestion that response filing fees should not be required; a request for more clarity as to fees; a recognition that ICANN’s funding for at least one argument per government addresses some concern but lacks clarity on what happens after one objection; and one comment suggesting that ICANN should fund an unlimited number of objections by individual governments related to geographic names.

A response fee will be required as it is meant to cover the administrative fees, which are incurred as a result of both the complainant and the respondent in the dispute. With respect to more clarity, certain pre-delegation objections will be based on the hourly rate for panelists, along with additional administrative work. The dispute resolution service providers (DRSP) and the individual panels with which they work establish the fees. Absent a specific allowance for funding by ICANN, all parties will be required to pay the fees as they are established by the independent DRSPs. With respect to ICANN funded objections beyond the one per government, each request for additional funding will be analyzed on a case-by-case basis depending on the particular facts and circumstances. Circumstances might include availability of funds and objection history of parties.

The protection for geographic names has undergone extensive discussion, review, and refinement throughout the entire development process of the new gTLD program. At present, country names will not be delegated at the top or second level. (At the second level, country names can be registered via a “.INFO-like” process.) In addition to the GAC Early Warning, there is also the GAC Advice process that may be used for the protection of geographical names. GAC advice can raise a strong presumption that the application should be rejected by the ICANN Board. As mentioned above, ICANN will fund the provider and panel fees for at least one objection per national government. Committing to an unlimited number of ICANN funded objections for individual governments, without some type of check and balance, is not workable – there is not sufficiently available funds (and those funds are essentially provided by registrants) and such a process can be subject to abuse.

One group has submitted several questions about the GAC Advice process. At bottom, the GAC Advice process is nothing different than what is already called for in the ICANN Bylaws. The GAC is entitled to provide the ICANN Board with advice on public policy matters, which the Board is required to consider. There is no automatic veto, although as always, GAC advice will be given the weight and consideration that GAC advice should be given under the circumstances, the strength of the stated advice, and ICANN’s Bylaws requirements. The time limitations set out in the Applicant Guidebook for GAC Advice are meant merely to clarify that “for the Board to be able to consider the GAC advice during the evaluation process, the GAC advice would have to be submitted by the close of the Objection Filing Period.” See Applicant Guidebook, section 3.1 at http://www.icann.org/en/topics/new-gtlds/draft-dispute-resolution-
Additionally, GAC advice stated in a certain way will raise a strong presumption that the Board should reject the application.

With respect to the question about whether the GAC will be charged a fee to provide an Early Warning or Advice, the answer is no. As written, it is contemplated that the GAC will not be filing an “objection” with an independent DRSP, but rather, submitting advice to the ICANN Board. Since dispute resolution fees are paid directly to the service provider, there would be no fees as the GAC is sending advice directly to the Board.

Some have commented on the Independent Objector (IO) and asked what the IO may consider. The IO can file objections based on limited public interest or community grounds only. The IO will not be prohibited from considering comments received at any time. It is contemplated that the IO will use the application comment forum or alternative comment forum, if one is established for the IO, as a source for comments. In terms of additional detail relating to the IO function, it will be published as the selection process is executed.

In terms of Expert panels, some pre-delegation dispute resolution processes call for 3-member panels and some call for one panelist. The number of panelists were chosen based on the complexity of issues addressed and other considerations. These options will not be revised at this stage, but will be reviewed, along with all other processes, as the first round of the new gTLD Program progresses. With respect to panel decisions, it is anticipated that the parties, which will be subject to the DRSPs confidentiality requirements, will receive the full text of an Expert Determination even if some parts are redacted before posting.

One commenter has questioned whether the ICC is the appropriate DRSP to administer the limited public interest and community objections. It should be recalled that in this context, the ICC International Centre for Expertise will administer the dispute resolution procedure; it will not adjudicate the dispute. Rather, the expert panel that is to simply be selected by the ICC will hear and issue a determination on the dispute. ICANN considers that the ICC’s International Centre of Expertise, with its extensive experience in administering various types of international disputes is well qualified to act as a DRSP. The rules of the International Centre for Expertise are available at: http://www.iccwbo.org/court/expertise/id4379/index.html.

A question has been posed about one of the criterion for limited public interest objections and its reference to principles of international law. This particular criteria has been to topic of several community-wide discussions and extensive debate, which resulted in the way this criterion presently reads. Further, this reference to internal law principles was part of the original GNSO policy and thus will remain as stated.

With respect to posting objections as they are filed the only comment received is supportive of the current stated position and thus does not require analysis.

One commenter questions the English language requirement with respect to the objection procedures. ICANN carefully considered this requirement, particularly in light of its commitment to operating as a multi-lingual organization. While it is true that at least for the first round the authoritative language will be in English, a party is permitted to “submit supporting evidence in its original language, provided and subject to the authority of the Panel to determine otherwise, that such evidence is accompanied by a certified or otherwise official English translation of all relevant text.” It is also expected that the dispute resolution service providers, and the panels, will use some discretion during the proceedings to ensure that they are fair to all parties, including as it relates to native languages. Requiring English to be the .authoritative language
for objection proceedings will certainly be reviewed after the first round.

In terms of community objections, one commenter suggests that requiring objectors to show that a considerable number of community members have objection (in other words - substantial opposition) is cumbersome. The requirement to show substantial opposition is part of the actual policy recommendation and thus will cannot be changed (see GNSO Policy Recommendation 20 on new gTLDs: “An application will be rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted”).

Other commenters are supportive of the recent revisions to the community objection standards.

MALICIOUS CONDUCT

Key Points

- A requirement for applicants to disclose their affiliates to enable ICANN to disqualify applicants based on affiliates’ conduct would not be effective and make the background screening unmanageable.
- Limiting the number of new gTLDs in the round by introducing new categories of TLDs would introduce new levels of risk and eliminate the benefits of the new gTLD program.
- ICANN has carefully considered comments from governments and the intellectual property community and introduced a number of mechanisms to protect users where TLDs are targeted to a population or industry that is vulnerable to online fraud or abuse.
- The GAC approach, calling for enhanced protections in proposed new gTLDs that “refer to particular sectors, such as those subject to national regulation,” has not been addressed by creating new categories, but has been addressed in an alternate way.

Summary of Comments

Vetted registry operators. ICANN’s broadening of the scope of offenses that render an applicant or entity ineligible to operate a new gTLD is commendable, but in light of the Board’s elimination of the vertical separation requirement, ICANN should require applicants to disclose their affiliates (defined in Sec. 2.9(c) of the new gTLD Agreement) and ICANN should be permitted to disqualify applicants based on affiliates’ conduct. This is particularly true where numerous affiliates of likely applicants have been found to have engaged in cyber squatting in UDRP proceedings. Microsoft (15 May 2011).

Prevention and protection measures need to go further.
COA commends the security improvements made in the discussion draft (e.g., evaluation criterion 30, enabling public comment and evaluation of the adequacy of security measures contemplated, as well as the recognition that this requirement is not limited to financial services-oriented TLDs but also applies to “other strings with exceptional potential to cause harm to consumers”); however, COA urges that ICANN go further to reduce the risks of opening up an unlimited range of new gTLDs. COA (15 May 2011).
COA supports the GAC approach which unfortunately so far the ICANN Board has rejected. The GAC proposal calls for enhanced protections in proposed new gTLDs that “refer to particular sectors, such as those subject to national regulation (such as .bank, .pharmacy) or those that describe or are targeted to a population or industry that is vulnerable to online fraud or abuse.” This formulation would clearly signal that ICANN would provide more rigorous scrutiny for any proposed new gTLD string targeted to sectors such as music, movies, or videogames, in order to guard against the risk that the new gTLD would be infested with copyright infringement. Regardless, COA believes that new gTLDs targeted to copyright industry sectors clearly fit the “exceptional potential to cause harm” criterion in the current draft applicant guidebook. COA requests confirmation from ICANN of this interpretation, such as by specifying that any gTLD targeted to a population or industry that is especially vulnerable to online fraud or abuse is also a string with exceptional potential to cause harm to consumers. COA (15 May 2011).

Regarding evaluation criterion 35, COA commends ICANN for providing incentives to applicants to commit themselves to mechanisms for preventing and remedying abusive or malicious behavior and to safeguard against domain name hijacking through requirements such as multi-factor authentication to process update or delete requests. ICANN should incorporate these mechanisms into the minimum requirements for “abuse prevention and mitigation” so that applicants failing to commit to them will receive a failing score of zero on this criterion. COA (15 May 2011).

Analysis of Comments

The new gTLD process seeks to protect registrants and users against malicious conduct. One solution is to conduct background checks on those applying for a new TLD. ICANN has discussed and considered the process suggested to screen applicant affiliates as well as applicants themselves. Such a step would introduce significant complications and costs to the background screening process without a balancing benefit. For example, in addition to ICANN screening the affiliate, it would also need to do so for the directors, officers, partners, etc. of the affiliate. This additional screening is cost and time prohibitive and would probably not result in many disqualifications given the level of scrutiny the applicant is subject to under the process. Affiliates are often distant and have no role in operation or conduct of a TLD to be operated by the applicant. Also, such an inquiry would lead applicants to set up new entities to provide separation between themselves and affiliates. This would not be just to mask prior bad conduct – it could simply be to avoid the expense and intrusion of background checks into their associates who will not play a role in the process.

Throughout the development of the new gTLD program and the Applicant Guidebook, there have been numerous discussions about limiting the number of new gTLDs in the first round and/or adding categories (i.e., beyond open and community such as geo, brand, etc.). It is possible these additional measures may mitigate some risks with new gTLDs, and they may also introduce new and unpredictable risks (i.e., abuses to the process). Some of these risks include: applicants registering to file an application to secure their place in a limited round and subsequently attempting to sell that slot to the highest bidder, underserved communities that may be disadvantaged and lose their opportunity in the round to large, well-funded entities who are capable of assembling their application quickly and inexpensively, and entities may be formed exclusively to qualify for a new category of TLD though they may have intentions of altering the purpose of the TLD after-the-fact and this could disadvantage another entity for the same string that did not prevail in a contention resolution proceeding. Also, limiting rounds
would also severely limit the anticipated benefits accruing from increased competition, choice and innovation. For these reasons and others, the process remains as it is today.

The GAC approach, calling for enhanced protections in proposed new gTLDs that “refer to particular sectors such as those subject to national regulation,” has not been addressed by creating new categories, but has been addressed in an alternate way. Long discussions of TLD categories in previous comment fora led to a conclusion that creating additional categories of TLDs were problematic. However, ICANN sought to address the GAC issue through the implementation of GAC Early Warning and GAC Advice processes. In that way, the GAC request that sensitive strings such as those purporting to address the needs of certain industry sectors can be reviewed, and if appropriate, objections can be lodged or the GAC can give public policy advice on these applications directly to the ICANN Board.

ICANN has listened to and responded with changes to the concerns of governments and the intellectual property community about the need to add enhanced measures to protect new gTLDs that describe or are targeted to a population or industry that is vulnerable to online fraud or abuse. To address these concerns, numerous protection mechanisms have been added to the new gTLD Applicant Guidebook including: the GAC Early Warning and Notice processes, the Trademark Claims Service (during Sunrise and at least the first 60 days of general registration), the Trademark Post-Delegation Dispute Resolution Procedure (PDDRP), the Registration Restrictions Dispute Resolution Procedure (RRDRP), and the Uniform Rapid Suspensions System (URS).

In the recent version of the evaluation criteria in the Applicant Guidebook, ICANN provided a scoring incentive (i.e., two points vs. one) for applicants that committed to taking extra measures for example to prevent and mitigate abuse. This is a strong incentive. Applicants must score more than “1” on some questions in order to pass the evaluation. This opportunity to obtain the extra point is clear – it was purposely made so in the anticipation that nearly all applicants will take advantage and describe additional mitigation measures. Some in the community have suggested that these extra measures should be incorporated to the minimum requirements for abuse prevention and that failure to do so should result in a failing score of zero. A difficulty is that we don’t know exactly what these “extra measures” might be – taking much objectivity out of the scoring is a score of “1” is based on some unknown increment to the standard. The existing mitigation measures are those recommended by the working group considered to be experts in this area. Therefore, it is thought a score of one in this area is acceptable and applicants that agree to take on the extra operational and technical costs associated with implementing additional measures should be rewarded for doing so. In contrast, some applicants may exceed the requirements in the other evaluation criteria and in doing so may find it unnecessary, for the purpose of their TLD, to score a two in the abuse prevention and mitigation category. It would be unfair to issue a failing score of zero in this area if the applicant has proposed a plan, a plan that may only require a score of one, that meets the proposed needs of their TLD.

ROOT ZONE SCALING

Key Points
ICANN, its advisory committees, the root server operators, and others have taken numerous steps involving thorough study and analysis to ensure ongoing stability of the root zone.

Given the published limits on delegation rates, there is agreement in the technical community that the delegation on new TLDs will not be a danger to root zone stability.

ICANN has committed to reviewing the effects of the new gTLD program on operations of the root zone system and to deferring second-round delegations until it is clear that root zone system security was not jeopardized by new gTLD delegations from the first application round.

Summary of Comments

Subsequent application rounds—security and stability studies. ICANN should not be reviewing the effects of the new gTLD program for security and stability after the first round; it should be conducting those types of studies before it even thinks about launching potentially hundreds of new TLDs and compromising the safety of businesses and consumers around the world. This point is an acknowledgement that ICANN knows that there is a danger associated with new TLDs. CADNA would like more details on how ICANN plans to conduct such studies, considering the controversy that surrounded its earlier economic studies. CADNA (13 May 2011).

Microsoft supports ICANN’s commitment to reviewing the effects of the new gTLD program on operations of the root zone system and to defer second-round delegations until it is clear that root zone system security was not jeopardized by first-round new gTLD delegations and its decision to publish the names and positions of individuals associated with a new gTLD application. Microsoft (15 May 2011).

Analysis of Comments

Investigation undertaken by ICANN to study and understand the effects of new TLD delegations on root zone performance has included:

- commissioning an independent report, which indicated that the root zone might be most affected by rate of delegation rather than the overall number of delegations,
- performing delegation rate studies that resulted in caps to delegation rates,
- informing every root zone operator of those limits, with confirmation from every root zone operator that those delegation rates would not negatively affect the performance of their root server, and
- conducting an in-depth study of the ICANN-operated L-root that determined that many multiples of anticipated delegations would not affect L-root performance.

Most of the most recent work has involved root-zone provisioning: ensuring that the administrative infrastructure can accommodate delegation work. Bolstering the IANA function to accommodate root management services for new registries is to be taken seriously, but is not an overly difficult undertaking. Currently ICANN receives, on average, one root management request per day (for approximately 272 TLD registries). The new TLD round may double or triple that number. Instead of processing one request per day, the IANA function might process two or
three. According to documentation published separately, this will result in two or three additional staff members. Continuation of IANA function services at the same level of excellence offered today is an extremely serious consideration, but it is expected that the new demands can be readily accommodated according to the plans in place.

To expand slightly another comment made, ICANN will collaborate with root server operators and others in the technical community to measure any effects of the first round delegations on root zone stability. This will include the root zone administrative provisioning system of delegations into the root zone and providing root zone management services to the new TLDS. There will be no second round delegations until those effects are measured.

Finally, beyond the responses to these comments, it should be noted that ICANN, through its recent consultations with the GAC, has committed to several actions to ensure ongoing stability of root zone operations and provisioning.

STRING SIMILARITY AND STRING CONTENTION RESOLUTION

Key Points

- For the initial evaluation, the proposed position is to keep the similarity assessment restricted to visual similarity only, especially in view of the complexities involved with assessing for example aural similarity, which can be invoked in the subsequent string similarity objection process. Final decisions on similarity will be made by a panel, as string similarity algorithm outcomes are only indicative, not authoritative. Community discussions have made it clear that human assessment is a necessity.

- Allowing for agreements between applicants to have confusingly similar strings coexist as TLDs would imply risks for registrants and end users and can only be considered when policy has been developed on provisions and procedures to reduce or eliminate such risks. Similar concerns may relate to linguistic variations of a string from a single applicant, while also noting that there are special provisions in the current approach for variant handling for IDN strings.

- The community views remain diverged on the Community Priority Evaluation threshold and the proposed position is to keep this value at 14 points.

- The wording in the AG will be clarified to explain why a certain flexibility regarding the contract establishment deadline must be kept to allow for differences in complexity, rather than giving a runner-up in a contention resolution an automatic right to proceed if the winner fails to meet the deadline.

- Auction proceeds will be kept separate and only used for purposes agreed to by the community, for example to reduce fees as suggested, provided this meets with community approval.
• The risk that an applicant in a contention set may cause intentional delays is minimized by the fact that the application completeness check has a time limit for the applicant to provide any missing material.

Summary of Comments

Visual similarity (Module 2, Section 2.2.1.13).
Similarity should be limited to “visual.” “Aural and meaning similarity” should be removed. If not, then in the case of IDNs an incumbent ASCII registry will be practically entitled to have or block all TLDs equivalent in meaning or sound to the current ASCII TLD, and in all languages. If phonetic and meaning similarities are to be considered, then a current gTLD registry that is based on a generic word is granted the right for that word and concept in all languages and all scripts. This is not only unjustifiable from a cultural and social point of view (leading to the best IDN gTLD concepts in any script to be owned and operated by large Western ASCII-oriented corporations as opposed to poorer, native in-IDN country players), but it is not clear that it is even legal. Y. Keren (Module 2, 16 May 2011). I. Genov (Module 2, 16 May 2011). S. Subbiah (Module 2, 16 May 2011). P. Kolev (Module 2, 16 May 2011).

When deciding the issue of “confusingly similar”, not just visual, but audible/phonetic must be considered too. Future technologies that rely on speech recognition or for the disadvantaged such as sight impairment must be protected. Those who argue for “visual” only do so because they are operating an alternate root that includes many of the IDN gTLDs likely to be applied for. Alternate roots promote user confusion and should be outlawed and eradicated. F. Ulosov (16 May 2011).

“Meaning similarity” should not be considered because it can ban every IDN TLD that will come into the field in the future, harming the interests of non-English speaking countries in IDNs and resulting in a monopoly for the current TLD holders. S. Soboutipour (16 May 2011).

String Similarity—Proposal for Avoiding Contention Sets. To avoid creation of a contention set (and possible auction) in some cases caused by the application of the similarity assessment tool (e.g., hypothetically, “.bbc” and “.abc” applications from two well known companies, where both strings are used in the “.com domain” without any problems but the similarity assessment tool result is 92%, showing high similarity/high probability of user confusion), a small addition should be made to the chapter called “Similarity to Other Applied-for gTLD Strings (String Contention Sets)” on page 2-5 of the Guidebook: i.e., when ICANN notifies the applicants who are part of a contention set, it would give the applicants a fixed period of time to submit written statements that they do not object to the other applications in the set. This would reverse the contention set and allow the applications to proceed. This suggestion may offer a solution to many potential applicants who now see big hurdles in the area of string similarity and may decide not to apply because of the high risk of failure. T. Mustala (Module 2, 12 May 2011).

Co-existence recognition. The AG does not take into account co-existence agreements or natural co-existence between trade mark owners with similar marks (e.g., currently a successful application from NBC in round one would preclude ABC or BBC or NBA in future years. DHL could preclude the NHL, despite that these organizations co-exist in the real world.) ICANN should not be creating conflicts where they do not exist. There should be a mechanism so that trade mark owners that co-exist in the real world without causing consumers any confusion can co-exist at the top level of the DNS. Valideus (13 May 2011). MARQUES/ECTA (15 May 2011).
The string contention provisions should be modified to accommodate consent and co-existence agreements. Where all non-identical applications in a contention set consist of brands registered in at least ten national or supra-national trademark registries, the contention set should be dissolved if all the applicants inform ICANN that they believe the TLDs can co-exist without significant risk of consumer confusion. Such a mechanism would encourage brand owners to participate in the new gTLD process rather than resolving these issues through litigation (which could involve ICANN). IPC (15 May 2011).

Contention sets—linguistic variations. String similarity contention sets should not include similar strings requested by an applicant seeking linguistic variations of the applicant’s other applied-for string. BC (15 May 2011).

Community priority should be given to applicants scoring at least 13 points, not 14. The intention of Community Priority will not be realized if Community applicants cannot reasonably reach the 14 point threshold. E.g., just two objection filings would make it impossible for an applicant to achieve the required 14 points. The BC remains unconvinced that staff has adequately analyzed the possibility and probabilities of applicants reaching 14 points. Other stakeholders have supported a 13 point minimum score (e.g., COA, IPC). BC (15 May 2011).

Runner-up applicant. In 4.4, why shouldn’t the runner-up applicant have the right to proceed and why should it be at ICANN’s option? Without reasonable justification, these provisions seem to be unsatisfactory. RySG (15 May 2011).

Use of auction proceeds. ICANN still has not provided detail on potential uses of funds generated by auctions to resolve string contention between competing new gTLD applicants. If skeptics prove correct, auctions could generate considerable revenue to ICANN. The interests of accountability and transparency call for ICANN to present a more specific plan for use of these proceeds for consideration by the community well before the new gTLD round launches. COA (15 May 2011).

Proposal for use of auction proceeds. Discussion of the issue of the use of auction funds is still open and subject to resolution before the release of the final guidebook (see footnote from section 4.3 of April 2011 draft applicant guidebook). The comments of A. Doria propose a process by which these funds can be allocated to resolve some of the pending issues involved in fee reduction —to address the GAC concern for inclusiveness and fair access to the application process—for applicants who meet the JAS WG’s eligibility criteria. A. Doria (Module 4, 16 May 2011).

Section 1.1.2.10 revision. We expect this section can be used in competing applications (contention sets) to take speculative advantage of intentionally caused delays by delaying the said completion of all aspects of evaluation. The following sentence should therefore be added: “Applicants should be given a limited time of not more than 4 weeks to submit missing parts of their applications.” dotHotel (15 May 2011).

Analysis of Comments

The comments regarding the scope of the similarity assessment are well taken. As has been stated in relation to previous public comment periods, the string similarity assessment in the initial evaluation is solely focused on visual similarity. The support from many for that approach is noted, as is the diverging view that aural similarity be considered, an approach that is controversial in principle and very difficult to perform in practice, while such similarity can indeed
be invoked in a subsequent string similarity objection process. The proposed position is to keep the established approach unchanged. One comment suggests that, “Aural and meaning similarity” should not be considered at all. As reinforced by community discussion, possible examination for these types of similarity was included in the policy recommendations of the GNSO that was approved by the Board. The idea is that user confusion should not be likely to occur – no matter what the cause of that confusion, Therefore, absent other policy advice, the current objection model that includes all types of confusion will remain in place, although the similarity assessment during initial evaluation will be limited to visual similarity.

Regarding suggestions that applicants can agree on coexistence for confusingly similar strings, it has repeatedly been clarified in responses to previous public comment periods that a finding of confusing similarity cannot as such be resolved thru mutual agreement by the involved applicants. Such an approach would not make the strings appear less confusingly similar to the internet user, which is the fundamental aspect to consider, especially given the considerable security risks for registrants and end user that such similarities can entail over the whole lifespan of the involved TLDs. A policy basis for agreement provisions and safeguards to eliminate such risks must be developed before such an approach can be considered. This matter has already been addressed in previous public comment analyses and the proposed position is not to change the current approach in the Applicant Guidebook in this regard.

Regarding the noted high similarity scores provided by the algorithm for strings that arguably can coexist, given that they have coexisted on the second level under .com without causing problems, it must be emphasized that the algorithm score is only one input to be considered by the string similarity panel and not authoritative in any way regarding findings of similarity. Community discussions have made it clear that confusion is a human reaction and that consideration by humans is indispensable for truly assessing similarity, which will thus be the task of a panel. It is the intention to refine the algorithm in view of the panel’s findings and thereby improve it for future rounds, but the algorithm outcomes will be considered as solely indicative for now. No change in that approach is foreseen for the first round.

For the claim that “linguistic variations” of a string from a single applicant should not be put in a contention set, one has to distinguish between a couple of different cases. If the intended meaning is “variant TLD strings” declared by an applicant as described in the Guidebook (see separate section), thus occurring within a single IDN gTLD application, they will be handled according to those rules and not be put in a contention set based on the applicants declaration of variants, while still being considered as a basis for assessing similarities with other applied-for strings. If the intended meaning is translations/transliterations/transcriptions, the strings would appear in separate applications and be assessed for visual similarity and may indeed be found to be confusingly similar, for example in the case of an ASCII string and a Cyrillic string. Such strings will not be permitted to coexist as gTLDs in the DNS, regardless of whether they are put forward by the same applicant. Future policy development may potentially change this approach, provided sufficient safeguards can be identified, but for the first New gTLD application round no change in this approach is foreseen.

As noted in previous analyses of public comments regarding the threshold for winning in Community Priority Evaluation, community views on the required score diverge, with strong arguments put forward for either 13 or 14 points as the most appropriate value. Regarding the example given in the comment, implying that two groups’ opposition would make the applicant lose two points and likely score overall below the threshold, this will be the case if the opposition is duly reasoned and comes from sizeable groups within the addressed community - arguably a sign that the support is undermined. However, as explained in the definitions and guidelines for
criterion 4, the standards are set high for any opposition to be taken into account as relevant in order to prevent that spurious or obstructionist opposition would affect the score. The definitions and guidelines for the criteria are as important as the criteria themselves for the scoring and have been gradually developed in the light of comments like the one provided here. In fact, the same comment on risks with opposition scoring for community applicants was submitted for an earlier AG and prompted in depth consideration and refinement of the guidelines for criterion 4. The proposed position is not to change the wording of the guidelines.

The comment on the rights of a runner-up relates to the text in section 4.4 that “If a winner of the contention resolution procedure has not executed a contract within 90 days of the decision, ICANN has the right to deny that application and extend an offer to the runner-up applicant, if any, to proceed with its application. For example, in an auction, another applicant who would be considered the runner-up applicant might proceed toward delegation. This offer is at ICANN’s option only. The runner-up applicant in a contention resolution process has no automatic right to an applied-for gTLD string if the first place winner does not execute a contract within a specified time.” The reason why this is at ICANN’s option only is in order to provide appropriate flexibility for a process that, as experience has shown, may justify extensions of the 90-day period in complex cases. The comment is appreciated as the current text lacks this explanation and clarifying language will be inserted.

Regarding the comments about potential auction proceeds, it has repeatedly been stated by ICANN that those will be kept separate from ICANN’s normal budget and used in ways agreed to by the community. To use such proceeds for fee reductions for needy applicants, as suggested by one comment, is indeed an option, provided it meets with community agreement.

The Guidebook (recently revised) states:

The purpose of an auction is to resolve contention in a clear, objective manner. It is planned that costs of the new gTLD program will offset by fees, so any funds coming from a last resort contention resolution mechanism such as auctions would result (after paying for the auction process) in additional funding. Any proceeds from auctions will be reserved and earmarked until the uses of funds are determined. Funds must be used in a manner that supports directly ICANN’s Mission and Core Values and also allows ICANN to maintain its not for profit status.

Possible uses of auction funds include formation of a foundation with a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community, such as grants to support new gTLD applications or registry operators from communities in subsequent gTLD rounds, the creation of an ICANN-administered/community-based fund for specific projects for the benefit of the Internet community, the creation of a registry continuity fund for the protection of registrants (ensuring that funds would be in place to support the operation of a gTLD registry until a successor could be found), or establishment of a security fund to expand use of secure protocols, conduct research, and support standards development organizations in accordance with ICANN’s security and stability mission.

The amount of funding resulting from auctions, if any, will not be known until all relevant applications have completed this step. Thus, a detailed mechanism for allocation of these funds is not being created at present. However, a process can be pre-established to enable community consultation in the event that such funds are collected. This
process will include, at a minimum, publication of data on any funds collected, and public comment on any proposed models.

Concerning the comment about applicants causing intentional delays for a full contention set, it must be noted that any delays for any application in a contention set, due to for example extended evaluation or objections, will indeed delay the ultimate resolution of the contention set. Contention resolution cannot take place until every involved application have passed the preceding steps or been eliminated in them. First at that point will the configuration be clear of the final contention set to resolve, as applications rejected in the previous steps may change the configuration in important ways and potentially even eliminate the need for contention resolution. However, the risk that any applicant will cause intentional delays by not providing missing parts of its application is limited as the applicant, after the initial completeness check has identified deficiencies in the application, must complete its application within a required timeframe or face rejection.

GEOGRAPHICAL NAMES

Key Points

- Additional protections for geographical names are available through new GAC Early Warning and GAC Advice procedures.
- Protections for capital city names are available for multiple representations of that name, as described in the Guidebook.
- Regional and continent names identified in specific list will require approval of super-majority of governments for reasons stated.
- Processes exist for release of geographic second-level names that rely on approval of ICANN, GAC or governments. They will be clarified in Guidebook.

Summary of Comments

Protect all geographical names. Non-capital city names should be protected to the same degree as capital city names. All geographical names (regardless of existence in the ISO 3166 list) which the national government specified per the right of the national government should be protected to the same degree as capital city names. These protected names would be listed by each government and pre-registered with ICANN. Tokyo Metropolitan Government (13 May 2011).

Protect variations of capital city names. Variations of capital city names (in any language) should be protected by requesting documentation of support from the relevant governments (e.g., “Tokyo” and “Tokyo-to” both represent the capital city of Japan). Tokyo Metropolitan Government (13 May 2011).

Sufficiency of implementation schedule. Given procedures for government or public authority letters of support, public objection and dispute, as well as the fact that several important items have not yet been mutually agreed upon by ICANN and the GAC, the entire process must allow sufficient implementation time from final approval of the DAG to the beginning of the new gTLD program and deadline of application. It is requested also that ICANN immediately present a new
schedule that includes the timeline of acceptance and evaluation, etc. Tokyo Metropolitan Government (13 May 2011).

**IDN gTLDs.** Introduction of IDN gTLDs is especially important for the Internet community in Asia. With the introduction of IDN ccTLDs, users increasingly expect IDN gTLDs to be accessible. *DotAsia (Module 2, 3 May 2011).*

**Support for government/public authority procedures.** UNINETT Norid is pleased that the post delegation procedure for geographical names now seems to be in place. The wording in both text of the guidebook, 2.2.1.4.3 Documentation Requirements and in the attachment to Module 2—Sample Letter of Government Support (“ICANN will comply with a legally binding order from a court in the jurisdiction of government/public authority”)—will together with the changed wording in the New gTLD Registry Agreement 7.13, make it possible for governments/public authorities to give their support. It is absolutely necessary that this agreement make it clear that ICANN will respect any order from a court of competent jurisdiction. *UNINETT Norid (Module 2, 11 May 2011).*

DIFO is pleased with the language ICANN added to the text in the Discussion Draft guidebook in 2.2.1.4.3. and finds that it is a compulsory part of the procedures in order to keep trust in ICANN and the multi-stakeholder model. *DIFO (15 May 2011).*

**Jurisdiction.** DIFO is still concerned about the jurisdiction of geographical TLDs. The Danish ccTLD .dk is operated under Danish jurisdiction, and DIFO finds it obvious that a TLD relating to a geographical name, e.g. “copenhagen” or “jylland” should be governed by Danish law and not by other jurisdictions. *DIFO (15 May 2011).*

**Regional TLDs.**
The fixed arbitrary numeric “cut off” percentile mechanism (Module 2, Section 2.2.1.4.2, Point 4 of the current guidebook) may be inappropriate for regional initiatives and would seem insensitive to diversity. Each region is different and has its own unique circumstances within its technical and Internet community, geo-politically and in other aspects. More important is a process that would allow an applicant of a regional initiative to explain how it would outreach to and continue to engage the respective governments not only before or during the application process but continuing forward post delegation. In addition, regarding what is most important, it may not be about what percentages of countries started or have joined a regional initiative, but whether the initiative has appropriate open doors and enlargement policies, demonstrating a continued commitment to inclusiveness. Demonstrated commitment, through a process such as a GAC early-warning system, is most important to ensure that an applicant proposing a regional initiative is the appropriate candidate for such an undertaking. We believe that the DotAsia initiative experience has shown that an early warning system can work, and that a more collaborative approach between the GAC and the applicant/registry operator can be successful for the community at-large. *DotAsia (Module 2, 3 May 2011).*

We are supportive of the comments of the DotAsia initiative that: (1) a one size fits all arbitrary percentile for regional TLD initiatives is inappropriate; (2) the new gTLD process should respect the diversity and different cultural, geopolitical and Internet community conditions for each regional initiative; and (3) commitment from the applicant to continue (beyond the application stage) to respond to governments in the region is more important. *B. Burmaa (Module 2, 5 May 2011); K. Huang (Module 2, 6 May 2011); J. Disini (Module 2, 6 May 2011); H. Hotta (Module 2, 11 May 2011); LIM Choon Sai (Module 2, 12 May 2011); RySG (15 May 2011). A. Saleh*
Regional TLDs—5-macro regions. It is recognized that the new gTLD program is designed with scalability in mind; however, given that there are only 5 macro-regions (and a very limited number of listed sub-regions), a more accommodating process respecting the vast diversity between each region should not pose a problem. DotAsia (Module 2, 3 May 2011).

Regional TLDs—GAC input. GAC input should be sought for all regional name applications. An early warning system, followed up by the applicant, that provides the applicant, ICANN and GAC with flexibility to more appropriately address the issues unique for each regional initiative will form a much better and more comprehensive process. DotAsia (Module 2, 3 May 2011).

New language offered for Module 2, Section 2.2.1.4.2, Point 4 (in italics). DotAsia offers the following rewrite for ICANN’s consideration: “In the case of an application for a string appearing on either of the lists above, ICANN will consult with the Government Advisory Committee as part of its evaluation process. [delete “documentation of support will be required from at least 60% of”]. The applicant should present documentation demonstrating the outreach to and correspondence with the respective national governments in the region, and there may be no more than one unmitigated written statement of objection to the application from relevant governments in the region and/or public authorities associated with the continent or the region. Furthermore, the applicant is required to describe and explain how its governance and operations support continued responsiveness to and cooperation with relevant governments in the region and/or public authorities associated with the continent or the region.

Where [delete “the 60% rule is applied, and”] there are common regions on both lists, the regional composition contained in the ‘composition of macro geographical (continental) regions, geographical sub-regions, and selected economic and other groupings’ takes precedence. DotAsia (Module 2, 3 May 2011).

Government “no objection procedure”—criticism. The 2.2.1.4.2 requirement of document of support from at least 60% of the respective national governments in the region is very difficult to achieve or in some cases irrelevant for the following reasons:

1. Governments are inclined not to provide written documents to a private company, especially on a topic they are not very interested in. This means that many of the governments will not send a “no objection” document even if they have no objection.

2. Especially for IDN TLDs, many governments will not be very interested and it is unlikely that a “no objection” document will be written by such governments.

3. The appropriateness of IDN TLDs cannot be decided by governments other than those who use the characters of the specific IDN TLD (e.g., the Japanese TLD string for .asia will not interest governments other than Japan. Such governments cannot decide the appropriateness of the Japanese TLD string, and they will not write a “no objection” document).

H. Hotta (Module 2, 11 May 2011).

An arbitrary figure of 60% is not practical or feasible for implementation:

1. Most government agencies and/or statutory boards need to maintain impartiality and will find it difficult to provide a written statement of support to a private commercial entity in such a situation, even if these government agencies and/or statutory boards in essence do not object to the application.
One region may be home to numerous different languages and cultures, with one country’s official language differing from another’s. It is unfair and inappropriate to ask for a government to support an application for a language that is not analogous to its own official language.

LIM Choon Sai (Module 2, 12 May 2011).

Country and territory names. UNINETT is pleased that country and territory names are still taken out of the new gTLD program. Even if it is stated that this applies only for this application round (page 2-14), we take it for granted that this will apply until the ccNSO Study Group on Country and Territory Names has completed their work. This evaluation was removed from the ccPDP on IDN, as country and territory names include both Latin and non-Latin names.

Country codes. ICANN’s proposed prohibition of country codes at the second level is unrealistic and anti-commercial and will be hard to police. It would prohibit a dot brand applicant from registering a country name at the second level for a perfectly logical and legitimate reason (e.g. us.budweiser). As there is no prohibition on the creation of folders (e.g. www.budweiser/uk) this is an artificial restriction that should be lifted.

Evaluation Question 22 implies a registry operator can formulate a plan to release geographic names, but Specification 5, Section 2 of the Registry Agreement states that a registry operator can release two-character country codes but not geographic names. AusRegistry requests that Specification 5 be modified to match language in Question 22 and therefore allow the registration of geographic names under the TLD. AusRegistry (16 May 2011).

Use of Geographic Names at Second and Other Levels--Dot Brand Applicants. The importance of protecting geographic names is understandable but we ask ICANN to recognize the special nature of potential dot brand applicants and either relieve them of this requirement (question 22, DAG) or provide (or grant permission to independently develop and employ) a universal solution which will allow dot brand applicants to release the reserved geographic names (as well as two-label country codes) for their exclusive internal use all at once. GAC could implement a universal solution whereby a centrally maintained list of countries and ccTLD operators who have agreed to their country names/country codes being registered under dot brand TLDs (without the need for special procedures) is made available. As a result, any Registry who wishes to use such names will simply enter into an agreement with GAC or another relevant body, rather than having to consult with over 200 different governments individually. If introducing such a mechanism is not viable, dot brand applicants would benefit greatly from being exempt from the requirement to create reservation and release mechanisms for geographic names. Alternatively, GAC could provide a list of contact points for the government representatives associated with each second level string. Moreover, governments could be obliged to respond to a request from the registry within a set period of time. Internet users will benefit greatly from being able to find and access their preferred brands according to the geographic locations. This may be delayed unnecessarily if the release procedures for geographic names are overcomplicated.

Brights Consulting (14 May 2011).

Subject to approval from relevant national governments, a single-registrant TLD should be allowed to register both two-letter abbreviations and full country and regional names at the second level (add this language to Section 2.6 “and except for single-registrant TLDs with respect to geographical names at the second level”). Single-registrant TLDs will reasonably
want to create second level domains for their operating units or chapters in each country or region (e.g. Canada.canon). *BC (15 May 2011)*.

Brand TLDs may require the use of e.g. “jp” or “Japan” at the second level. According to Specification 5 of the draft Agreement, registries must first initially reserve names on the ISO 3166-1 list. Though it is specified that the applicant may propose a release of these reservations, the process for releasing these names should be outlined in the final applicant guidebook. *UrbanBrain (16 May 2011)*.

Specification 5.5 notes that country and territory names contained in the ISO 3166 list shall be reserved at the second level and specifically points toward only the short form English equivalent of the country or territory name. There is no mention of alpha-3 names. Given the purpose behind the reservation of country and territory names, this leaves some with the question if second level names such as “JPN.TLD” can be registered. ICANN should clarify this in the upcoming version of the guidebook. *UrbanBrain (16 May 2011)*.

**Analysis of Comments**

**Protection of capital and other city names**

ICANN takes the interests of governments and public authorities in protection of geographic names seriously. The issues regarding which geographical names should be protected have been extensively discussed. To provide adequate protection to capital city names, the Guidebook indicates that protection extends to “a representation, in any language,” of a capital city name. Governments may use the GAC Early Warning or objection processes to identify a capital city name if it has not been identified by the applicant.

Non-capital city names have also been discussed extensively. Briefly, there are millions of city names, many of which are also generic words in which entities other that governments have legitimate interests. Even the definition of what constitutes a city may be uncertain in many circumstances. City names present challenges because city names may also be generic terms or brand names and, in many cases, city names are not unique. Unlike other types of geographic names, there are no established lists that can be used as objective references in the evaluation process.

An application for a city name, where the applicant declares that it intends to use the gTLD for purposes associated with the city name, will require support or non-objection from the relevant government or public authority.

Applicants are required to provide a description/purpose of what the TLD will be used for, and to adhere to the terms and conditions of submitting an application including confirming that all statements and representations contained in the application are true and accurate. The Registry Agreement has the same clause.

While, a workable method for clear identification and reservation of city names cannot be developed, other protections have been put in place and there are notable recent improvements to those protections. In consultations with its Governmental Advisory Committee (GAC), ICANN has developed GAC Early Warning and GAC Advice processes. Through these, governments can identify sensitive TLD applications and provide advice directly to the applicant and the ICANN Board that those applications be denied. Details for these new processes were first in
the April 2011 Discussion Draft and have been updated in the newly posted version of the
Guidebook.

Timelines for government action

ICANN also acknowledges the comments on suggestions regarding the publication of timelines – ensuring sufficient time exists for objections, expressions of support and other procedures. ICANN will develop detail in its timelines to demonstrate how these processes work together.

Requirement for approval of continent and regional names

ICANN understands the objections made to a “one size fits all” approach for government approval of continent and regional names. Several models have been explored before and after the publication of the requirement that TLDs for continent names listed in independent, official lists be approved by 60% of the governments in that region. As has been described in earlier analysis, a conservative approach has been taken in providing a methodology to delegate continent names.

ICANN agrees that the new processes for GAC Early Warning and GAC Advice provide new avenues for governments to directly object to sensitive strings and geographical names in particular. However, GAC advice and recent discussions have not indicated that release of continent or regional names should be liberalized as a result. The Guidebook recommends that these types of geographic names be released if 60% of the countries in that region approve the delegation to the applicant and no more than one government objects. The commenters seek to eliminate the approval criteria, in favor of demonstrated cooperation with governments and no more than one government objection. Some comments state that many or most governments do not care about this issue and so approval is difficult to achieve. There are very few regional names and their delegation should be handled conservatively. There are many other names through which community members can find representation in the DNS other than these few names on official lists.

At the Mexico City meeting, the Board asked staff to provide greater specificity concerning government approval requirements for region and continent names. The definition developed as a result provides applicants with more clarity about what qualifies as a regional or sub-regional name and the degree of approval required. The requirement for 60% approval means that a slightly greater than a majority of governments in each area affirmatively approve the application and the applied for string. In this case, mere non-objection does not apply. The reasonableness of the 60% figure was checking by calculating at the number of countries / territories required for approval within each of the UN defined regions. The requirement that there be more than one written objection means that no single government has a veto power. The mechanism adopted is aligned with UN practices (which in most cases is by a simple majority in committees of the General Assembly: http://www.un.org/ga/60/ga_background.html).

While the 60% requirement is a constant for all such regions, when tested, it appears to make sense for regions with few and with many countries.

Second-Level Geographic Name Registration
Well-intentioned, well-thought out and well-taken comments see clarification on which geographic names are reserved at the second-level and more specificity about the procedures for releasing them.

As the Guidebook indicates, both two-character country-code names and country names that are specifically indicated on certain lists are reserved on the second level. Additionally, as indicated in the Guidebook, those names can be released through a process. One suggested process in the Guidebook is: “For reference, applicants may draw on existing methodology developed for the reservation and release of country names in the .INFO top-level domain,” referencing http://gac.icann.org/system/files/dotinfocircular_0.pdf.

Applicants can seek to release country-name labels (two-letter codes and reserved country names) either in their application or after delegation through the process defined by the agreement. Additionally, as indicated, processes approved by governments or the GAC may be employed for the release of country names at the second level.

Comments indicate that the language in the Guidebook and in the agreement are inconsistent. The language will be clarified to clearly indicate the availability of these processes for release of second-level, reserved country names and two-letter codes.

REGISTRY AGREEMENT

General

Key Points

- ICANN expects all applicants to enter into the agreement substantially as written, and it is not possible at this stage to anticipate what changes from the agreement might be acceptable and which would require Board review – it will depend on the unique circumstances of each agreement.

Summary of Comments

Changes to Agreement. The guidebook states that additional Board review of the registry agreement will not be necessary if there have been no “material changes to the base agreement.” The RySG asks that ICANN clarify what it considers “material changes to the base agreement,” and generally under what circumstances ICANN plans to negotiate changes to the base agreement. The RySG thinks that the imposition of new obligations or risks upon registry operators, or reduced indemnification for registry operators, could constitute “material changes.” RySG (15 May 2011).

Analysis of Comments

As indicated in the guidebook, ICANN expects all applicants to enter into the agreement substantially as written. Applicants may attempt to negotiate exceptions, but that could delay delegation of the TLD. Whether a particular requested change will require Board review will depend on the unique circumstances of each agreement and it is not possible to anticipate now exactly which changes or categories of changes would be considered to be material and thus
require Board review. Further work might be done on developing ICANN processes and guidelines regarding this issue between now and when new gTLDs begin to be delegated under the program.

**Vertical Integration (VI)**

**Key Points**

- The Applicant Guidebook applies to registry operations only. Entities that engage in both registry and registrar operations will also be governed by the agreements and mechanisms applicable to both registry operators and registrars.

- Registry Operator is required to give notice to ICANN in the event a registry service subcontractor or other affiliate becomes a registrar or registrar reseller and should structure its third party contracts to account for this.

**Summary of Comments**

*Update fully to account for VI Decision.* ICANN needs to go back and check that the draft applicant guidebook and all mechanisms therein fully account for vertical integration issues. E.g., Specification 7 of the registry agreement refers to new registries complying with the PDDRP, RRDRP, and URS, but has no reference to registries complying with UDRP decisions (which registrars would have to comply with). Moreover the PDDRP refers only to conduct by the registry. The ICANN Board’s decision to eliminate vertical separation is likely also to have important implications and consequences for existing consensus policies. *INTA (14 May 2011).*

*Use of Subcontractors.* In Section 2.9(b), the current language states that if a registry subcontracts provisioning of a registry service to an ICANN-accredited registrar, it has to disclose such arrangement to ICANN. What if the registry’s subcontractor is not an ICANN-accredited registrar initially, but obtains registrar accreditation at some later point? Or starts operating as a reseller? Or its own affiliate does so? Is the registry supposed to somehow find that out and inform ICANN? This may be not an insignificant obligation; especially given the definition of Affiliate is quite broad. The RySG recommends further clarification of this issue, specifically as it relates to the actions of third parties after the fact. *RySG (15 May 2011).*

**Analysis of Comments**

The applicant guidebook is designed to apply to new registry operators and is limited in scope to the operation of new registries. To the extent that a registry operator also engages in registrar operations, those operations will be governed by a registrar accreditation agreement between the registrar and ICANN. The registrar would thus be subject to the UDRP and all other mechanisms binding on accredited registrars.

To the extent that a subcontractor or affiliate of Registry Operator becomes an accredited registrar or registrar reseller, Registry Operator is required to notify ICANN. Registry Operator should ensure that its agreement providing for subcontracted services requires the subcontractor to notify Registry Operator if the subcontractor or one of its affiliates becomes an accredited registrar or registrar reseller. Registry Operator will then be in a position to notify ICANN of such arrangement.
Pricing

Key Points

- The definition of “Qualified Marketing Programs” will be further refined in the new draft Registry Agreement based on community comment.

Summary of Comments

Renewal pricing. Microsoft supports the revisions to Section 2.10(c) to prohibit abusive and/or discriminatory renewal pricing practices. *Microsoft (15 May 2011).*

The revised clause in Section 2.10 in AGv6 is an improvement but there is still ambiguity about discounted renewal pricing. This ambiguity could be removed if ICANN changed the exception (“Qualified Marketing Program”) to encompass discounts or incentives that formed part of a promotional program authorized by the registry agreement and deleted the new definition of “Qualified Marketing Programs.” (See text of RySG comments at pp. 10-11 for specific proposed language to revise Section 2.10 to address RySG’s concerns.) *RySG (15 May 2011).*

The term “Qualified Marketing Programs” does not have the same scope as allowable promotional programs elsewhere under the agreement or in the Code of Conduct. Thus, there may be uncertainty in whether a registry could offer discounted renewal pricing, even when the renewal price would correspond to the price of the original registration, where that registration was discounted. (See text of RySG comments at pp. 10-11 for specific proposed language to revise Section 2.10 to address RySG’s concerns.) *RySG (15 May 2011).*

Analysis of Comments

The draft provision regarding “Qualified Marketing Programs” is designed to allow Registry Operator to offer short-term targeted marketing programs that benefit registrants. No other provision in the Registry Agreement or the specifications to the Registry Agreement specifically references marketing programs. The new draft Registry Agreement contains revisions in response to community comments further refining the definition of Qualified Marketing Programs in response to concerns raised in the comments. The exact revisions suggested in the comments could be broadly construed to allow for discriminatory pricing programs and were not adopted. The addition to the end of this provision suggested in the comments is unclear and could lead to confusion. Registry Operator may offer renewal discount pricing to any registrar regardless of whether or not the registration in question was originally registered as part of a discount program so long as Registry Operator complies with the notice provisions of Section 2.10(b) and the uniform pricing provisions (which include criteria for discount programs) in Section 2.10(c).

Use of Registrars

Key Points

- There is no requirement to submit the registry’s initial Registry-Registrar Agreement to ICANN for approval.
- Registry Operator must directly contract with registrars through the Registry-Registrar Agreement for the TLD.

- In accordance with prior GNSO guidance, registry operators may not discriminate against registrars, regardless of the type of TLD.

**Summary of Comments**

**Process for RRA (Section 2.9)**. What will be the process and timing for approving the initial form of the registry-registrar agreement (RRA) for each registry, and what criteria will ICANN use in approving the initial form of registry-registrar agreement and any revision thereof? The RySG has two areas of concern. One: that approval of new TLD RRAs may get bogged down and inhibit launches. Two: that ICANN may introduce new obligations on registries and/or registrars via the RRA approval process. **RySG (15 May 2011).**

**Governmental entities—Agent for Registry-Registrar Agreements (RRAs)**. The assumption in Module 5 at 5-12 and 5-13 that a registry operator will enter into direct contracts with registrars raises concern for governmental entities that operate under a wide range of constraints in their contracting processes. For example, given the contracting processes of the City of New York, it is unrealistic for the City to enter directly into contracts with ICANN-approved registrars, particularly since registrars will not provide goods or services directly to the City. The City of New York anticipated having its selected registry operator vendor (who will be named in any TLD application and be subject to review and approval of ICANN) directly enter into registrar agreements. The City of New York suggests that permitting an applicant to act through a responsible agent in entering into RRAs that are compliant with ICANN policies ought to be allowed in compliance with Module 5 and the gTLD Registry Agreement. Failure to take into account the strictures of government contracting in allowing flexibility in this regard could substantially limit the applicant pool for government-sponsored TLDs and the ultimate success of any TLDs delegated to applicants that include a governmental entity. **City of New York (13 May 2011).**

**Single-registrant TLD discrimination exception**. The base agreement should be amended to include the same exception for single-registrant TLDs that is contained in Item 6 of the Code of Conduct. The registry agreement should not unduly restrict single-registrant TLDs from using only a wholly-owned or closely affiliated registrar to register and manage names that it controls. **BC (15 May 2011).**

**Analysis of Comments**

The draft Registry Agreement does not require Registry Operator to have its Registry-Registrar Agreements approved by ICANN. Registry Operator may negotiate those agreements, subject to any obligations of Registry Operator set forth in the Registry Agreement or ICANN policies, without ICANN involvement. Once those agreements are in place, Registry Operator is required to obtain ICANN’s consent for any amendments to those agreements.

Successful applicants that subcontract operation of a registry must be a party to the registry’s Registry-Registrar Agreement for the TLD. The subcontractor may not enter into that agreement directly with registrars. However, the applicant/Registry Operator is required to
ensure that its subcontractor complies with the obligations of Registry Operator set forth in the Registry Agreement as well.

Per Principle 19 set forth in the GNSO’s Final Report – Introduction of New Generic Top-Level Domains, “Registries must use only ICANN accredited registrars in registering domain names and may not discriminate among such accredited registrars.” The GNSO report did not provide for different treatment for single-registrant or “.brand” TLDs. It would be inappropriate to include a provision in the registry agreement for new TLDs that is contrary to GNSO guidance on the new gTLD program. Contrary to the assertions in certain community comments, the obligations and restrictions of Section 2.9 are intended to apply to all new TLDs, regardless of type. However, registrants can choose any registrar that meets the registry’s specifications for accreditation. Registrants are free to register names in the TLD with one registrar.

Other Registry Operator Covenants

Key Points

- In response to comments that the obligation to investigate and respond to all reports of illegal conduct in the TLD may be onerous, the obligation has been revised in the new draft Registry Agreement to apply only to reports from governments or governmental agencies.

- The obligation to provide registry data for use in economic studies has been clarified in the new draft Registry Agreement to exclude analyses and work product of Registry Operator.

- All data transmissions of registry data to ICANN or other third parties pursuant to the Registry Agreement must be done in compliance with privacy laws.

Summary of Comments

Illegal conduct reports (Section 2.8). Microsoft supports the new requirement in section 2.8 of the new gTLD Registry Agreement that requires the Registry Operator to take reasonable steps to investigate and respond to reports of illegal conduct in the TLD. However, ICANN should provide some illustration of what constitutes “reasonable steps.” Lack of clarity of this requirement will undermine its effectiveness. Microsoft (15 May 2011).

The new language creates “an undefined obligation to ‘investigate and respond to any reports . . . of illegal conduct in connection with the use of the TLD.’ The language as drafted can be interpreted to require a Registry Operator to investigate and take some form of affirmative action in response to “any” complaint raised, either from a government agency or a private party. Additionally, what constitutes “illegal conduct” can vary from country to country and may include activities such as dissenting speech that would be legally protected forms of conduct in other countries. Registry Operators should not be mandated to comply with or take some form of affirmative action in response to any such request, particularly where such requests are in contravention of the Registry Operator’s internal policies or the laws of the country in which the Registry Operator is located. Registry Operators should not be required to respond in any fashion to an inquiry from a private party. The use of the term “governmental and quasi-governmental agencies” is overbroad. The RySG suggests revising the provision as provided in its comments. RySG (15 May 2011).
The scope of the obligation to investigate and respond ought to be better defined as well as the associated notion of illegal conduct. AFNIC (15 May 2011).

Cooperation with Economic Studies (Section 2.15). Microsoft supports the new section 2.15 requiring registry operators to cooperate with any ICANN initiated or commissioned economic study of the impact or functioning of new gTLDs on the Internet. Microsoft (15 May 2011).

As drafted, this provision would grant ICANN unfettered access to confidential and proprietary information, including internal reports and analyses, maintained by the Registry Operator. Therefore, the data that is required to be provided should be limited to raw operational data maintained by the Registry Operator, which should be sufficient for any economic studies being performed. Additionally, the provision should require ICANN to seek written consent from a Registry Operator before it provides, as a result of legal process (i.e., subpoena, civil discovery request, etc.) or otherwise, any data collected from a Registry Operator to a private party or a government agency. RySG (15 May 2011).

Regarding 2.15 and Specification 4, the scope of the data to be requested of the registry operator, including “confidential data,” should be better defined. Provisions on the use, storage, and destruction of such data by ICANN or its designee should also be discussed. Under French law, entities based in France which seek to transfer personal data to a non-EU-based entity must comply with requirements that strictly regulate such transfer and require adequate protection of this data. As a consequence, under French law this provision of the registry agreement may not be sufficient to ensure full disclosure of data to ICANN. Additional guarantees and contractual arrangements may be required. AFNIC (15 May 2011).

Analysis of Comments

The requirement for Registry Operator to take reasonable steps to investigate and respond to reports of illegal conduct was inserted in response to the GAC Scorecard. This provision has been revised in the new draft Registry Agreement in response to community comment in order to limit its scope. For example, Registry Operator will only be required to take reasonable steps with respect to reports from governments and governmental agencies. The provision is designed to require cooperation with legitimate government concerns regarding conduct within the TLD. Registry Operator is required to take reasonable steps to investigate and respond to reports regarding such conduct but the appropriate actions will be dependent on the facts and circumstances of each report. As such, it would not be appropriate to provide for detailed required actions or to define what may be considered illegal conduct. ICANN acknowledges that certain non-governmental organizations play an important role in combating malicious conduct in the DNS, and those organizations could work with ICANN and law enforcement to explore ways to facilitate cooperation between such organizations and governments in order to ensure that such reports receive all due attention. The provision has been further revised to clarify that Registry Operator will not be required to take any action in contravention of applicable law.

The obligation of Registry Operator to provide data for economic studies has been further revised in response to community comment to clarify that disclosure of internal analyses and work product of Registry Operator is not required. ICANN’s obligation under this provision to aggregate and make anonymous such information is intended to function as a documented assurance of this treatment. A new provision has been added to the draft Registry Agreement obligating Registry Operator to notify all registrars of the intended uses of personal data that is
transferred to ICANN by Registry Operator pursuant to the Registry Agreement and to require registrars to obtain the consent of registrants to such uses.

**ICANN Covenants**

**Key Points**

- ICANN will not be responsible for possible censorship of some TLDs by governments or other entities.

**Summary of Comments**

**ICANN Obligations with respect to the Authoritative Root Database.** The new proviso is not appropriate as it would allow ICANN to disclaim all responsibility of blocking or restricting access to a TLD regardless of whether or not they may have contributed to the event or could have taken steps to prevent such event (including where it failed to exercise or enforce a contractual right). We recommend that the new language be deleted. RySG (15 May 2011).

**Analysis of Comments**

ICANN will not and cannot directly block access to a TLD by itself, and ICANN is not party to contracts whereby it can prevent government entities, ISPs or other entities from blocking or restricting access to certain TLDs. In the event that such blocking or restriction takes place, it would not be appropriate to hold ICANN liable, and Registry Operator should seek redress directly against the entity responsible for the blocking.

**Renewal**

**Key Points**

- Presumptive renewal provisions benefit the Internet community.

**Summary of Comments**

**Presumption of renewal (Article 4).** The presumption of renewal is a policy item on which the community has not yet reached agreement. This issue should be discussed by the community and should not be made policy by being enshrined in a contract. At the very least a clause should be added that, should a Policy Development Process (PDP) be held on the topic of presumption of renewal, the consensus view of such a PDP would be applicable to future considerations of renewal for the contract. A. Doria (15 May 2011).

**Analysis of Comments**

Presumptive renewal provisions are included in all other current ICANN gTLD registry agreements. These renewal provisions encourage long-term investment in robust gTLD operations, and this has benefitted the community in the form of reliable operation of the registry infrastructure. Including a provision stating that ICANN could unilaterally re-write the renewal provision would discourage investment in top-level domains, since any money invested in marketing and operating the TLD might end up “wasted” if ICANN were to take away the TLD
and hand it over to another operator. Specification 1 to the Registry Agreement specifically excepts registry agreement renewal modifications from the category of matters that can be modified by Consensus Policies, which is also consistent with ICANN’s current gTLD registry agreements.

Termination

Key Points

- Previous revisions to the termination provisions regarding bankruptcy related actions in response to community comment have provided adequate flexibility.

Summary of Comments

Termination by ICANN based on Bankruptcy Related Actions. Although this timing is better than the original 30 days, the new version continues the exception for proceedings that are not dismissed in 60 days. An extension of this period to 120 days might make it more meaningful. In addition, adding the term “imminent” before “material” would be helpful. RySG (15 May 2011).

Termination by ICANN based on Certain Criminal Acts. Microsoft supports the additions to section 4.3(f) that allow ICANN to terminate the new gTLD Registry Agreement if the registry operator does not terminate employees or board members convicted of certain crimes, found by a court to have engaged in fraud or violated fiduciary duty, and substantive equivalents thereto. Microsoft (15 May 2011)

Analysis of Comments

The provision relating to ICANN’s termination right in connection with certain bankruptcy related actions was revised in the April 2011 discussion draft Registry Agreement to give Registry Operator additional time to secure dismissals of certain actions. This change was made in connection with community comments and provides adequate flexibility. Any material threat to the viability of the registry for the TLD in this context, regardless of whether or not it could be argued to be imminent, will trigger this provision.

Transition Following Termination

Key Points

- The criteria that must be met and demonstrated to ICANN in order for Registry Operator to have a consent right in the event of a re-delegation of the TLD has been conformed to similar criteria provided in the Code of Conduct.

- Some potential TLDs meeting the specified criteria might not be associated with established or widely recognized trademarks. Future delegation of certain of these TLDs without the consent of the previous registry operator might be appropriate, but any future delegation of a previous TLD would be subject to “Legal Rights” objections.

Summary of Comments
Redelegation of dot brand gTLDs. ICANN still has not satisfactorily addressed concerns raised by numerous commenters about its plan to reserve to itself the sole discretion to redelegate a dot brand TLD if the trademark owner registry operator chooses to no longer operate the TLD. The revisions to section 4.5 are unclear and insufficient—are “sub-domains” second-level domains? ICANN must not transition a dot brand TLD to a successor registry without the written consent of the registry operator, which can be withheld, conditioned, or delayed. The potential for consumer confusion and fraud if a dot brand TLD is operated by entity not affiliated with or authorized by the brand owner is both tremendous and troubling. Microsoft (15 May 2011).

INTA appreciates the recent changes to Section 4.5 of the Registry Agreement but believes that further clarification is needed to specify the circumstances under which a brand owner can reasonably withhold consent to redelegate a TLD reflecting its brand name. In addition, the exception should not be limited to registries where the domains are registered to the registry operator or its affiliates but should include where registrants are licensees of the pre-existing trademark incorporated in the dot brand top-level string. Many dot brand operators such as franchisors may wish that domains for which independent licensees are responsible be registered to the licensee. These provisions should apply to all uses of dot brand registries. If ICANN does not address these issues, the potential loss of control over the mark that could result from redelegation of a dot brand registry over the brand owner’s objection could present a fundamental obstacle to brand owners applying to run new gTLD registries. INTA (14 May 2011).

Section 4.5 helps to remove one barrier to companies considering dot brand applications—the risk that the company will lose control of the TLD string corresponding to its brand or company name if it chooses to discontinue operation of the TLD. COA (15 May 2011).

Single-registrant TLD Definition. The exception in Section 4.5 should reference a common definition for single-registrant TLD instead of defining it separately (i.e., “Provided however, that for Single-registrant TLDs, ICANN may not transition operation of the TLD…”). In circumstances where ICANN transitions a single-registrant TLD to a new operator, IP rights of the original operator should not be conveyed to the new operator or to ICANN, as transferring registry data may reveal trade secrets to a third party, including customer lists. BC (15 May 2011).

The following definition should be added to the guidebook and registry agreement: “Single registrant TLD: a TLD where the Registry Operator is the registrant of record for all domain names in the TLD.” BC (15 May 2011).

Analysis of Comments

The revisions to Section 4.5 in the April 2011 discussion draft Registry Agreement were intended to respond to multiple community comments regarding the ability of ICANN to redelegate certain TLDs. The criteria that must be met (and demonstrated to ICANN) in order for Registry Operator to have a consent right over re-delegation in the event of a termination or expiration of the Registry Agreement has been conformed to the related criteria in the Code of Conduct located in Specification 9 to the new draft Registry Agreement (which has been revised in response to community comments). However, because this criteria (as well as the significantly broader criteria suggested in the community comments) could result in TLDs meeting the criteria that have a TLD string that is not an established or widely recognized trademark, the provision has been revised to clarify that such TLDs will not be transitioned upon
expiration or termination of the Registry Agreement without Registry Operator Consent, but the TLD strings associated with such TLDs could be available for future delegation, subject to established “Legal Rights” objections available at the time of such future delegation. This approach will allow both trademark and non-trademark based TLDs that fall within the specified criteria, while providing for a mechanism for trademark-based TLDs to prevent future delegation of an abandoned TLD if such delegation would infringe legal rights as recognized under “Legal Rights” objection processes.

The criteria in this provision and in the Code of Conduct is intended to describe TLDs in which the Registry Operator maintains use of all registrations in the TLD for itself or its affiliates. Expanding the criteria to cover TLDs that permit use of registrations by unaffiliated third parties could result in the operation of TLDs that avoid the Code of Conduct obligations of other TLDs while utilizing a similar business model.

Dispute Resolution

Key Points

- Community comments have not articulated what potential conflict of interest is created by the use of the ICC for more than one area of dispute resolution.

Summary of Comments

Arbitration forum. The ICC International Court of Arbitration should not be the exclusive forum for arbitration of disputes arising under the Registry Agreement; the ICC will be under contract with ICANN as the dispute resolution provider for the Limited Public Interest and Community objection procedures, thus creating a potential conflict. IPC (15 May 2011).

Analysis of Comments

The ICC International Court of Arbitration provides a set of rules and procedures for the adjudication of disputes. Community comments have not articulated what potential conflict of interest is created by the use of those rules and procedures for more than one area of dispute resolution. Individual arbitrators will be subject to conflict of interest rules and properly excluded if they have a preexisting relationship with a party to the arbitration.

Change in Control of Registry Operator and Assignment

Key Points

- The current provision regarding assignment and subcontracting gives ICANN the ability to evaluate any assignee or successor to Registry Operator based on the then-current criteria.

- An initial time-based complete bar on such transactions is unnecessary.

- Assignees of the Registry Agreement will be subject to all obligations of Registry Operator.
Summary of Comments

Assignment Restrictions. The possibility of an active secondary market in gTLDs raises significant concerns. ICANN should take action to minimize the likelihood that such a secondary market will come to fruition and to the extent it does that participants do not successfully evade the examination and objection processes. Four measures are immediately identifiable:

1. ICANN should revise section 7.5 of the Registry Agreement to prohibit assignments within a defined period (12-18 months) after delegation, which would decrease "gTLD flipping";
2. ICANN should ensure that post-delegation dispute resolution procedures apply to assignees of the Registry Agreement, which would mitigate considerably the risk that the gTLD assignee itself or its intended use of the gTLD would essentially elude the objections that could have been levied had the gTLD assignee been the original applicant.
3. ICANN should develop "Assignment Guidelines" that set forth the conditions and criteria that a proposed gTLD Assignee must satisfy to obtain ICANN's approval of the proposed assignment. These conditions and criteria at a minimum must be the equivalent of the full range of evaluation criteria for new gTLD applicants.
4. The guidelines comparable if not identical to the Assignment Guidelines should be developed to ensure that a change in control is not used as a mechanism to evade substantive evaluation of the new controlling entity or person. Microsoft (15 May 2011).

Analysis of Comments

Section 7.5 of the Registry Agreement provides that Registry Operator must give certain notices and obtain ICANN's written consent in connection with an assignment or change of control transaction. Further, ICANN shall be deemed to have reasonably withheld its consent to any such transaction in the event that ICANN reasonably determines that the person or entity acquiring control of Registry Operator or entering into such subcontracting arrangement (or the ultimate parent entity of such acquiring or subcontracting entity) does not meet the ICANN-adopted registry operator criteria or qualifications then in effect. Currently, such criteria and qualifications would include the evaluation criteria for new gTLD applicants. These criteria and qualifications may be revised from time to time and ICANN must maintain flexibility regarding the criteria it will apply to any specific transaction based on the facts and circumstances (including community objections) relating to such transaction. There is no compelling reason, given ICANN's ability to evaluate and approve assignment transactions, to impose an initial time-based complete bar on such transactions.

If ICANN consents to an assignment of the Registry Agreement, all obligations of Registry Operator will be binding on the assignee, including all post-delegation dispute mechanisms and other rights protection mechanisms.

Whois-Specification 4

Key Points

- ICANN is committed to enforcing the thick Whois requirements of the new gTLD program.
• Whois “verification” is addressed by the Registrar Accreditation Agreement, and any changes should be discussed through the GNSO.

• Searchable Whois will continue to be an optional service.

• Handling of Whois data must be done in compliance with privacy laws.

Summary of Comments

Compliance improvement. While we recognize that ICANN is working toward improving Whois, the system, particularly enforcement of the agreements, is not yet adequate in the current DNS. ICANN needs to clearly address how it plans to provide adequate compliance and enforcement as enforcement will become even more difficult with the introduction of new gTLDs. News Corporation (13 May 2011).

Purpose of TLD or its business model. The defined Whois output described in Specification 4 of the Registry Agreement does not account for the purpose of the TLD or its business model. ICANN should consider giving applicants the ability to propose relevant Whois output. AusRegistry (16 May 2011).

Whois accuracy—mandate verification and monitoring. Although Time Warner is pleased that ICANN has recognized the importance of accurate Whois by offering new gTLD applicants an extra point in the evaluation process if they verify and monitor Whois, we see no reason why this should not be made mandatory. Such a requirement, if vigorously enforced, could help prevent a wide range of abuses. Time Warner (14 May 2011).

Mechanisms to promote Whois quality should be incorporated into the minimum requirements for the “abuse prevention and mitigation” criterion so that applicants failing to commit to them will receive a failing score of zero on this criterion. COA (15 May 2011). SIIA (15 May 2011). IPC (15 May 2011).

In addition to specifying and mandating accurate Whois efforts as part of the required minimum requirements, ICANN should, after the first round of applications is received and reviewed, revise the minimum requirements for any abuse policies and procedures to incorporate best practices contained in the various applications. Otherwise, different registries may employ drastically different standards, which will lead to greater abuses for the gTLDs with the laxest standards. NCTA (Module 2, 13 May 2011).

ICANN has taken a step backwards by not requiring all the new gTLDs in this round to take on all of the expanded Whois data quality and accessibility obligations agreed to by three of the gTLDs in the previous round (.asia, .mobi, .post). These eminently reasonable and practical requirements represent the current best practice for gTLD registry agreements, and ICANN has never adequately explained why all new gTLD registries should not be required to meet them. COA (15 May 2011); SIIA (15 May 2011); IPC (15 May 2011).

Searchable Whois should be mandatory. Awarding of an additional point to applicants that will provide it is positive but insufficient. Access to searchable Whois is extremely valuable to entities that combat online fraud, abuse and infringement, and the search specifications in Specification 4 will be very useful in combating online fraud and abuse. It is regrettable that ICANN allowed a committee of its Board to make the arbitrary determination that searchable Whois would not be required. Microsoft (15 May 2011).
Standardize Searchable Whois. Searchable Whois, described in Evaluation Criteria Question 26 and in Specification 4 of the Registry Agreement, requires further technical definition. The way it is currently described will create multiple, potentially incompatible implementations which will give end users inconsistent results and leave them confused. Searchable Whois should be standardized prior to opening the Application Period. If Searchable Whois is not standardized prior to the Application Period opening, then the “exceed requirements” for Evaluation Criteria Question 26 should be removed. *AusRegistry (16 May 2011).*

The Whois improvements in the April 2011 discussion draft do not go far enough. Also, regarding evaluation criterion 26, ICANN has never explained why a fully searchable Whois presents greater risks of abuse than the current model offered by registrars in the thin Whois environment. Under ICANN’s stewardship, Whois service has been allowed to degrade to its current feature-poor level. *COA (15 May 2011).*

Zone File Access Requests. The RySG recommends that ICANN re-insert language requiring the submission of IP address and host name from all parties requesting zone file access. This information is critical to enable the registry operator to prevent abuse. *RySG (15 May 2011).*

Clarification. The information required under the “Bulk Registration Data Access” provision in Specification 4, Section 3 of the Registry Agreement does not match the minimum information required in the Data Escrow Specification 2 of the Registry Agreement and is in fact a subset of such data. It would be helpful to understand how providing Bulk Registration Data Access to ICANN ensures operational stability of Registry Services, or facilitates compliance checks on accredited registrars as requiring a subset of the Data Escrow data requires the Registry Operator to develop and support what is seemingly an additional unnecessary process. *AusRegistry (16 May 2011).*

National privacy laws. Sections 1.4, 1.5 and 1.6 of Specification 4 require the Registry Operator to provide specific elements of output for the Registration Data Directory Service. However, in some countries publication of some elements listed in these sections violates national privacy laws. *AusRegistry* suggests a provision be added which requires the provision of Whois as stated in Specification 4, unless the Registry Operator’s national privacy laws prohibit some elements from being displayed. If those laws do so prohibit display, the Registry Operator must document this in the Application to ICANN and describe what elements of Whois can be provided under national privacy laws. For elements which will remain undisclosed as part of the Registry Operator’s legal obligations, key/value pairs must still be present and the value of the undisclosed field must still comply with the format requirements in section 1.7 of Specification 4. *AusRegistry (16 May 2011).*

Analysis of Comments

ICANN is committed to enforcing the thick Whois requirements of the new gTLD program. Accurate and high-quality Whois data will be an important component of new gTLDs and applicants offering robust Whois services will receive extra credit in their applications for such efforts. However, the benefits of additional mandated Whois requirements must be weighed against countervailing technical and privacy concerns, the increased costs of providing such services and ICANN’s enforcement resources. After considering community comments, the Whois requirements in the new draft Registry Agreement are considered to be appropriate minimum obligations for each registry. Registry Operator may require additional Whois outputs consistent with its business model, subject to applicable laws. Any departures from these
baseline/status quo Whois requirements should be discussed in ICANN’s GNSO. “Maintenance of and access to accurate and up-to-date information concerning domain name registrations” is specified as being within the “picket fence” of topics on which ICANN may establish new Consensus Policies.

Whois “verification” is the subject of Registrar Accreditation Agreement section 3.7.8, which provides that registrars will comply with any Consensus Policies established by ICANN “requiring reasonable and commercially practicable (a) verification, at the time of registration, of contact information associated with a Registered Name sponsored by Registrar or (b) periodic re-verification of such information.” Any new Whois verification requirements for gTLDs should be discussed and approved through the GNSO.

The issue of searchable Whois was referred by ICANN to the ICANN Board Data Consumer Protection Working Group <http://www.icann.org/en/committees/consumer-protection/>. The DCP-WG’s final report noted "The DCP-WG advises the Board that making searchable Whois mandatory is a policy matter that would have to be referred to the GNSO, but we accept it being optional as proposed in current version of the Applicant Guidebook. We flag that there are consumer and data protection issues that could be raised through a searchable Whois system." <http://www.icann.org/en/committees/consumer-protection/report-on-recommendations-07dec10-en.htm>.

At its meeting in Cartagena, the ICANN Board adopted this recommendation and therefore searchable Whois will continue to be offered at the option of each registry rather than as a mandate applicable to all new registries. This is consistent with the current gTLD agreements, a few of which do mention that searchable Whois will be offered. The provisions governing the searchable Whois requirements in each of the current registry agreements that provide for it were inserted voluntarily by the applicable registry as part of the negotiation process and were not required by ICANN. Those provisions all mention that the service would be offered “subject to applicable privacy policies,” and therefore the guidebook’s approach of taking into account privacy considerations is not inconsistent with current practice.

The community has yet to develop a standardized specification for searchable Whois that could be incorporated into Specification 4. Because of the lack of consensus on such a specification, Specification 4 provides only high-level guidelines on the requirements for searchable Whois in those registries that chose to provide it.

The information required under the “Bulk Registration Data Access” provision in Specification 4, Section 3 of the Registry Agreement does not match the minimum information required in the Data Escrow Specification 2 of the Registry Agreement because ICANN does not require full escrow data for the purposes of compliance checks and verification of registrar utilization.

ICANN has previously established a procedure for handling Whois conflicts with privacy laws available at http://www.icann.org/en/processes/icann-procedure-17jan08.htm. Since the inception of this procedure, no submissions have been received. A new provision (utilizing language from provisions in existing ICANN registry agreements) has been added to the new draft Registry Agreement requiring compliance with applicable privacy laws that will be applicable to all handling of personal data, including Whois data.

Reserved Names-Specification 5
Key Points

- The ICANN Board is considering criteria that must be met for a limited class of established global organizations to qualify to have their marks reserved from registration. However, this process is ongoing and no decisions have been reached regarding implementing this criteria into the new gTLD program.

- Pursuant to GAC advice, geographic names appearing on predetermined lists and country codes will be initially reserved at the second level, regardless of the type of TLD. Those names may be released in connection with the consent of the applicable government or pursuant to procedures approved by the GAC (e.g. the .INFO procedures).

Summary of Comments

Reserved names list—Olympic and Olympiad. The terms Olympic and Olympiad should be added to the Reserved Names list, which would be consistent with the laws of the U.S. and numerous other countries around the globe, and allow the U.S. Olympic Committee to focus its limited resources on its primary mission, rather than on defensive registrations and a cumbersome process of filing formal objections against infringing gTLD applications. The RPMs in the guidebook are insufficient to protect the Olympic movement. Both the USOC and the International Olympic Committee (IOC) have repeatedly advocated that reserving the words Olympic and Olympiad in the top and second levels of all new gTLDs serves the public interests of the international community and comports with accepted principles of law. As explained in detail in past comments submitted to ICANN, more than thirty nations have enacted sui generis legislation reserving exclusive use of the words Olympic and Olympiad to the IOC and the National Olympic Committees. More than sixty countries have signed the Nairobi Treaty on the Protection of the Olympic Symbol, establishing special protection for the Olympic Movement as an internationally accepted principle of law. The GAC has advised the ICANN Board to approve the request to add Olympic and Olympiad to the Reserved Names list. USOC (13 May 2011). IOC (15 May 2011).

Reserved names—remove ICANN mark. Equity and fairness dictate that the ICANN Mark should be removed from the reserved names list. ICANN should bear the same burden and expense of protecting its mark against cyber squatters as other brand owners must. Microsoft (15 May 2011).

Two-character labels. The newly added reservation of “two-character labels” should be deleted from the applicant guidebook; it may cause problems and lacks a rationale. Confusion with the “two-letter codes” of ccTLDs or technical reasons are by all means not evident. Reservation of two-character labels has never been a publicly discussed point and putting it into the guidebook rules without a community discussion is outside the policy development process. Its timing is odd because at least a dozen gTLD and ccTLD registries have released “two-character labels” just recently or are planning to release them in the near future, with ICANN’s approval in the case of gTLDs. Reservation of two-character labels will create legal challenges in many new gTLDs (e.g. in Germany DENIC, the operator of the .de ccTLD was in 2010 forced by competition and trademark laws to release all “two-character labels”). dotBERLIN (11 May 2011). DOTZON (15 May 2011).

Protect all geographical names. Non-capital city names should be protected to the same degree as capital city names. All geographical names (regardless of existence in the ISO 3166 list)
which the national government specified per the right of the national government should be protected to the same degree as capital city names. These protected names would be listed by each government and pre-registered with ICANN. *Tokyo Metropolitan Government (13 May 2011).*

**Protect variations of capital city names.** Variations of capital city names (in any language) should be protected by requesting documentation of support from the relevant governments (e.g., “Tokyo” and “Tokyo-to” both represent the capital city of Japan). *Tokyo Metropolitan Government (13 May 2011).*

**Country codes at the second level.**

ICANN’s proposed prohibition of country codes at the second level is unrealistic and anti-commercial and will be hard to police. It would prohibit a dot brand applicant from registering a country name at the second level for a perfectly logical and legitimate reason (e.g. us.budweiser). As there is no prohibition on the creation of folders (e.g. www.budweiser/uk) this is an artificial restriction that should be lifted. *Valideus (13 May 2011)*. *MARQUES/ECTA (15 May 2011).*

**Use of Geographic Names at Second and Other Levels—Dot Brand Applicants.** The importance of protecting geographic names is understandable but we ask ICANN to recognize the special nature of potential dot brand applicants and either relieve them of this requirement (question 22, DAG) or provide (or grant permission to independently develop and employ) a universal solution which will allow dot brand applicants to release the reserved geographic names (as well as two-label country codes) for their exclusive internal use all at once. GAC could implement a universal solution whereby a centrally maintained list of countries and ccTLD operators who have agreed to their country names/country codes being registered under dot brand TLDs (without the need for special procedures) is made available. As a result, any Registry who wishes to use such names will simply enter into an agreement with GAC or another relevant body, rather than having to consult with over 200 different governments individually. If introducing such a mechanism is not viable, dot brand applicants would benefit greatly from being exempt from the requirement to create reservation and release mechanisms for geographic names. Alternatively, GAC could provide a list of contact points for the government representatives associated with each second level string. Moreover, governments could be obliged to respond to a request from the registry within a set period of time. Internet users will benefit greatly from being able to find and access their preferred brands according to the geographic locations. This may be delayed unnecessarily if the release procedures for geographic names are overcomplicated. *Bright Consulting (14 May 2011).*

Subject to approval from relevant national governments, a single-registrant TLD should be allowed to register both two-letter abbreviations and full country and regional names at the second level (add this language to Section 2.6 “and except for single-registrant TLDs with respect to geographical names at the second level”). Single-registrant TLDs will reasonably want to create second level domains for their operating units or chapters in each country or region (e.g. Canada.canon). *BC (15 May 2011).*

Brand TLDs may require the use of e.g. “jp” or “Japan” at the second level. According to Specification 5 of the draft Agreement, registries must first initially reserve names on the ISO 3166-1 list. Though it is specified that the applicant may propose a release of these reservations, the process for releasing these names should be outlined in the final applicant guidebook. *UrbanBrain (16 May 2011).*
Specification 5.5 notes that country and territory names contained in the ISO 3166 list shall be reserved at the second level and specifically points toward only the short form English equivalent of the country or territory name. There is no mention of alpha-3 names. Given the purpose behind the reservation of country and territory names, this leaves some with the question if second level names such as “JPN.TLD” can be registered. ICANN should clarify this in the upcoming version of the guidebook. UrbanBrain (16 May 2011).

Evaluation Question 22 implies a registry operator can formulate a plan to release geographic names, but Specification 5, Section 2 of the Registry Agreement states that a registry operator can release two-character country codes but not geographic names. AusRegistry requests that Specification 5 be modified to match language in Question 22 and therefore allow the registration of geographic names under the TLD. AusRegistry (16 May 2011).

Analysis of Comments

The ICANN Board is considering criteria that must be met for a limited class of established global organizations to qualify to have their marks reserved from registration. However, this process is ongoing and no decisions has been reached regarding implementing this criteria into the new gTLD program.

In accordance with GAC advice, all country names appearing on the ISO 3166-1 list, as well as all two-letter country codes will generally be reserved from registration at the second level in new gTLDs. Specification 5 provides that ICANN may authorize exceptions to this requirement. Specification 5 has been revised to clarify that these names may be released with the consent of the applicable governments or pursuant to procedures approved by the GAC. The applicant will be responsible for describing whether it will seek to release such second-level strings and if so what procedures would be used. Such plans will be subject to GAC and community review prior to ICANN authorizing any exceptions. Any such exceptions might be granted on an individual basis, or on a blanket basis as long as each registry agrees to certain procedures. For example the GAC has previously indicated a preference for the procedure utilized for the release of country names in the .INFO TLD. Further work might be done on developing ICANN processes and guidelines regarding this issue between now and when new gTLDs begin to be delegated under the program.

Protecting all city names would not be feasible given the number of names potentially included in such categories. Also, names that happen to relate to some city, town, village, or hamlet somewhere might also have other legitimate uses that are not related to that city, town, village, or hamlet. This reasoning is described in detail under the geographical names section of this summary and analysis and in prior comment analyses.

Continuing Operations Instrument-Specification 8

Key Points

- All registry operators, including government entities, will be required to maintain a continuing operations instrument.
- Proposed alternatives to the continuing operations instrument may not provide the necessary resources to ensure stable registry functions.
Summary of Comments

Local governments—different treatment. The continued operations instrument requirement in Specification 8 would be particularly onerous for local governments in light of their budgeting processes. ICANN has elsewhere recognized in the draft Registry Agreement that TLDs operated by government entities should be treated somewhat differently than other TLDs—e.g., Article 4, section 4.5 alternative language for intergovernmental or governmental entities regarding transition of registry upon termination of agreement makes no reference to a continuing operations instrument. This is the correct approach since governmental entities are not subject to disappearing after registry launch and work under particular statutory requirements inconsistent with a continued operations instrument requirement. In addition, GAAP accounting principles do not permit the City of New York to carry balances between fiscal years, so maintenance of a continuing operations instrument over a 5-year period would violate annual accounting requirements intended to ensure compliance with state and local law as well as GAAP. The City of New York has sufficient assets to maintain registry operations at a level that should provide the requisite assurances ICANN seeks to address through a continuing operations instrument. City of New York (13 May 2011).

Objection to Continued Operations Instrument and proposed alternative. The description of the continued operations instrument in the current guidebook is not sufficiently clear. The continued operations instrument requirement has been a significant impediment to new applicants in their ability to raise funds or engage in appropriate business planning. RySG proposes a replacement to the continued operations instrument: the creation of a pseudo-insurance fund paid for by each of the new gTLD Registry Operators for the first 5 years following launch of the new gTLD (e.g. requiring each registry operator to pay an additional $5,000 in Registry Fees per year to ICANN or its designee) for the specific purpose of funding two or three Emergency Back End Registry Operators should be sufficient; see text of RySG comments for additional details). The function of the continued operations instrument also could take the form of an insurance policy written by a highly rated reputable insurer. If private insurance is not available, then the captive insurance fund described in RySG comments could be created. The $5,000 per registry per year figure should be viewed as a straw man until proper underwriting of the risk is done to determine an appropriate contribution. ICANN could hire the appropriate expert to calculate the appropriate contribution and pool size, and the cost of the expert could be reimbursed from the pool. RySG (15 May 2011).

Analysis of Comments

Exempting government or quasi-governmental applicants from the requirement to maintain a continuing operations instrument could jeopardize registrants in the event that such applicants/operators either decide or are unable to maintain the operation of the TLD for any reason. Because of this risk, the continuing operations instrument is required of all applicants, including governmental entities, in order to ensure stable registry operations and protection of registrants in the TLD. If ICANN were to exempt all government or quasi-governmental applicants from this obligation it could lead to abuses and cases where entities walk away from their TLD. Governments might abandon TLDs when governments change or during budget cuts.

The alternatives to the continued operations instrument described in the community comments have been considered by ICANN and determined to not be feasible. A registry funded emergency fund may not provide adequate resources to ensure stable registry function. Should a large number of registry operators fail within a short period following the launch of new gTLDs,
there would be insufficient participants in the such a fund to provide adequate funding to maintain emergence operations in the failed registries.

**Code of Conduct-Specification 9**

**Key Points**

- Registry Operators that are able to demonstrate to ICANN that they meet certain criteria described in Section 6 of the Code of Conduct may qualify for an exemption from the Code of Conduct but will still be required to comply with the other non-discrimination provisions of the Registry Agreement.

- The reservation of names that pose a threat to the security and stability of the DNS is permitted by Section 2.6 of the Registry Agreement.

- ICANN will make reports regarding compliance with the Code of Conduct public consistent with its accountability and transparency obligations.

**Summary of Comments**

**Input on Abuses and Compliance.** Before or during the application process ICANN should seek community input on potential abuses (including lists developed by the VI and RAP working groups), detection data, the data needed to detect, and protection mechanisms and compliance methods. Community input should also be sought on punitive measures to ensure compliance. *BC (15 May 2011)*.

**Dot Brand Applicants.** We are pleased to note that provisions which take into account the situation of potential dot brand applicants have now been included in the Registry Code of Conduct. *Bright Consulting (14 May 2011)*. The definition of unaffiliated third party needs to be clarified in this context – Need to limit use with respect to customers, subscribers, employees? Etc. *RySG (15 May 2011)*.

Exempting certain dot brand registries from the strictures of the Registry Operator Code of Conduct and in particular from the non-discrimination requirement among accredited registrars is a step in the right direction. ICANN should take the next logical step and allow the registry operator in this situation to dispense with the use of accredited registrars altogether. *COA (15 May 2011)*.

ICANN should clarify how the dot brand exceptions in Specification 9 and in Section 4.5 of the draft registry agreement operate before finalizing the applicant guidebook. Each exception applies only under stated conditions which differ from one another. It is not clear whether this distinction is intended or inadvertent and it may be unclear to potential dot brand applicants how they should structure themselves in order to benefit from either one or the other of these exceptions. *COA (15 May 2011)*. *IPC (15 May 2011)*.

The language “otherwise make available” in the exception provision for the dot brand/single registrant TLDs is too broad and should be replaced with “transfer control of the registration.” The phrase “otherwise make available” might be interpreted to include instances where a single-
registrant operator allows non-affiliated parties to post content to websites where the registration is still entirely controlled by the operator. BC (15 May 2011).

**Treatment of Registrars (Section 1(a)).** The provision should only oblige Registry Operator to provide an equal level of operation access to the registry’s systems and support services. The current language would appear to prohibit a broad array of arrangements that would be common practice between affiliated companies. For example, it would appear to prohibit a registry from providing an initial capital contribution to an affiliated registrar, or from providing shared services or facilities to such a registrar. Prohibiting a registry from providing these kinds of assistance to an affiliated registrar would render it impracticable for a registry to establish such a registrar, which would be inconsistent with the Board's directive to permit such arrangements. It could also put the registrar at a competitive disadvantage with other registrars that may enjoy such support from their affiliated companies. In addition, as only registrars have access to a registry's systems and support services, we do not believe it is necessary to prohibit registries from providing a preference or special consideration to resellers. RySG (15 May 2011).

**Registration of Names by Registry Operator (Section 1(b)).** This Section does not provide a carve-out for registration of names in order to preserve security and stability of the DNS (i.e.; conficker). This omission could negatively impact the capability of registries to operationally protect the security and stability of TLDs. RySG (15 May 2011)

Clarifications needed. Key terms such as “other related entity” have not been defined. All second level names which the registry intends to register in its own right as “necessary for the management, operations…” should be publicly specified either as reserved names in the registry operator’s application or as “additional registry services” through the RSTEP process. Otherwise, the exception in 1(b) of the Code of Conduct provides too wide a loophole and invites abuse by the registry operator over a wide range of second level domains. IPC (15 May 2011).

Proposed revision to Section 1(e), Specification 9. RySG recommends these changes (underlined): “Fail to adopt, implement and enforce policies and procedures reasonably designed to prevent the disclosure of confidential registry data or…except (i) as necessary for the management and operations of the TLD, and (ii) to the extent [delete “unless”] all unrelated third parties…” RySG (15 May 2011).

Internal Compliance Reviews. The RySG notes that publication of the results may deter discussion of confidential matters, which may be an unwanted result. RySG (15 May 2011).

Internal compliance review--checklist. The internal compliance reviews required by item 3 should be specified in more detail (e.g. a checklist of items to be included). IPC (15 May 2011).

**Analysis of Comments**

Through the previous two public postings of the draft Code of Conduct, ICANN has sought community input on the types of practices that should be prohibited or required in connection with the introduction of vertical integration. ICANN will continue to work with the community to mitigate any potential harms from vertical integration through appropriate revisions to the Code of Conduct.
The criteria that Registry Operator must meet and demonstrate to ICANN in order to qualify for a possible exemption from the Code of Conduct is intended to describe TLDs where all registrations are maintained by Registry Operator for its own use or the use of its affiliates. See the Analysis of Comments under “Transition Following Termination” for further discussion on the appropriate criteria. It is important to note that, consistent with GNSO Principals on the new gTLD program, Section 2.9 of the Registry Agreement, which mandates non-discrimination among ICANN-accredited registrars continues to be applicable to all types of TLDs.

Paragraph 1(a) has been revised in the new draft Registry Agreement in response to community comment to clarify that the non-discrimination restrictions apply to availability and use of registry services and not to other typical business arrangements between affiliates. Further, the reference to resellers has been removed as inapplicable.

A carve-out to Paragraph 1(b) allowing for the registration of names by Registry Operator in connection with the preservation of the security and stability of the DNS is not necessary as Registry Operator is permitted to reserve such names from registration in its discretion pursuant to Section 2.6 of the Registry Agreement. Registry Operator will not be required to list any names that it registers pursuant to Paragraph 1(b) but Registry Operator will be required to demonstrate how such names are necessary for the operation and management of the TLD if requested by ICANN. Should the registration of any such names violate a third party’s legal rights, the PDDRP will be available to resolve disputes arising from such violation.

The adoption of policies and procedures designed to avoid disclosure of confidential registry data is not sufficient. Registry Operator must covenant not to make such disclosures. As such, the proposed revisions to Paragraph 1(e) have not been adopted.

The results of internal reviews of compliance with the Code of Conduct will be made public consistent with ICANN’s accountability and transparency obligations to the community. ICANN may develop a required format to be used in connection with such reports following further study of the implementation of the Code of Conduct and reporting practices.

**Registry Performance Specification – Specification 10**

**Key Points**

- Registry response times will be subject to publication.
- All relevant ICANN contact information will be made available to registries.

**Summary of Comments**

**Monitoring Results.** ICANN is proposing a system by which ICANN will monitor registry response times over the Internet. The RySG has pointed out to ICANN that this monitoring method will yield variable results depending upon Internet traffic and transit issues beyond every registry operator’s control. The RySG would like confirmation that ICANN does not plan on publishing the monitoring results, which might for example be prejudicial to registry operators in certain parts of the world. *RySG (15 May 2011).*
ICANN Contacts (Sections 7.1 through 7.3). There should be an obligation for ICANN to publish to all Registry Operators the e-mail address and phone number for ICANN’s emergency operations department. RySG (15 May 2011).

Analysis of Comments

In connection with its accountability and transparency obligations, ICANN does intend to publish monitoring results. Information regarding response times may be important to registrants and other members of the community regardless of whether or not Registry Operator has full control over such response times.

ICANN will make all necessary contact information needed for “Emergency Escalation” available to Registry Operators as needed and appropriate.

New gTLDs have been in the forefront of ICANN’s agenda since its creation. The new gTLD program will open up the top level of the Internet’s namespace to foster diversity, encourage competition, and enhance the utility of the DNS.

Currently the namespace consists of 22 gTLDs and over 250 ccTLDs operating on various models. Each of the gTLDs has a designated “registry operator” and, in most cases, a Registry Agreement between the operator (or sponsor) and ICANN. The registry operator is responsible for the technical operation of the TLD, including all of the names registered in that TLD. The gTLDs are served by over 900 registrars, who interact with registrants to perform domain name registration and other related services. The new gTLD program will create a means for prospective registry operators to apply for new gTLDs, and create new options for consumers in the market. When the program launches its first application round, ICANN expects a diverse set of applications for new gTLDs, including IDNs, creating significant potential for new uses and benefit to Internet users across the globe.

The program has its origins in carefully deliberated policy development work by the ICANN community. In October 2007, the Generic Names Supporting Organization (GNSO)—one of the groups that coordinate global Internet policy at ICANN—formally completed its policy development work on new gTLDs and approved a set of 19 policy recommendations. Representatives from a wide variety of stakeholder groups—governments, individuals, civil society, business and intellectual property constituencies, and the technology community—were engaged in discussions for more than 18 months on such questions as the demand, benefits and risks of new gTLDs, the selection criteria that should be applied, how gTLDs should be allocated, and the contractual conditions that should be required for new gTLD registries going forward. The culmination of this policy development process was a decision by the ICANN Board of Directors to adopt the community-developed policy in June 2008. A thorough brief to the policy process and outcomes can be found at http://gnso.icann.org/issues/new-gtlds.

ICANN’s work next focused on implementation: creating an application and evaluation process for new gTLDs that is aligned with the policy recommendations and provides a clear roadmap for applicants to reach delegation, including Board approval. This implementation work is reflected in the drafts of the applicant guidebook that were released for public comment, and in the explanatory papers giving insight into rationale behind some of the conclusions reached on specific topics. Meaningful community input has led to revisions of the draft applicant guidebook. In parallel, ICANN has established the resources needed to successfully launch and operate the program. This process concluded with the decision by the ICANN Board of Directors in June 2011 to launch the New gTLD Program.

For current information, timelines and activities related to the New gTLD Program, please go to http://www.icann.org/en/topics/new-gtld-program.htm.
Module 1
Introduction to the gTLD Application Process

This module gives applicants an overview of the process for applying for a new generic top-level domain, and includes instructions on how to complete and submit an application, the supporting documentation an applicant must submit with an application, the fees required, and when and how to submit them.

This module also describes the conditions associated with particular types of applications, and the stages of the application life cycle.

Prospective applicants are encouraged to read and become familiar with the contents of this entire module, as well as the others, before starting the application process to make sure they understand what is required of them and what they can expect at each stage of the application evaluation process.

For the complete set of the supporting documentation and more about the origins, history and details of the policy development background to the New gTLD Program, please see http://gnso.icann.org/issues/new-gtlds/.

This Applicant Guidebook is the implementation of Board-approved consensus policy concerning the introduction of new gTLDs, and has been revised extensively via public comment and consultation over a two-year period.

1.1 Application Life Cycle and Timelines

This section provides a description of the stages that an application passes through once it is submitted. Some stages will occur for all applications submitted; others will only occur in specific circumstances. Applicants should be aware of the stages and steps involved in processing applications received.

1.1.1 Application Submission Dates

The user registration and application submission periods open at 00:01 UTC 12 January 2012.

The user registration period closes at 23:59 UTC 29 March 2012. New users to TAS will not be accepted beyond this
time. Users already registered will be able to complete the application submission process.

Applicants should be aware that, due to required processing steps (i.e., online user registration, application submission, fee submission, and fee reconciliation) and security measures built into the online application system, it might take substantial time to perform all of the necessary steps to submit a complete application. Accordingly, applicants are encouraged to submit their completed applications and fees as soon as practicable after the Application Submission Period opens. Waiting until the end of this period to begin the process may not provide sufficient time to submit a complete application before the period closes. Accordingly, new user registrations will not be accepted after the date indicated above.

The application submission period closes at 23:59 UTC 12 April 2012.

To receive consideration, all applications must be submitted electronically through the online application system by the close of the application submission period.

An application will not be considered, in the absence of exceptional circumstances, if:

- It is received after the close of the application submission period.
- The application form is incomplete (either the questions have not been fully answered or required supporting documents are missing). Applicants will not ordinarily be permitted to supplement their applications after submission.
- The evaluation fee has not been paid by the deadline. Refer to Section 1.5 for fee information.

ICANN has gone to significant lengths to ensure that the online application system will be available for the duration of the application submission period. In the event that the system is not available, ICANN will provide alternative instructions for submitting applications on its website.

1.1.2 Application Processing Stages

This subsection provides an overview of the stages involved in processing an application submitted to ICANN. Figure 1-1 provides a simplified depiction of the process. The shortest and most straightforward path is marked with bold lines, while certain stages that may or may not be
applicable in any given case are also shown. A brief description of each stage follows.

![Diagram of gTLD Application Process]

Figure 1-1 – Once submitted to ICANN, applications will pass through multiple stages of processing.

1.1.2.1 Application Submission Period

At the time the application submission period opens, those wishing to submit new gTLD applications can become registered users of the TLD Application System (TAS).

After completing the user registration, applicants will supply a deposit for each requested application slot (see section 1.4), after which they will receive access to the full application form. To complete the application, users will answer a series of questions to provide general information, demonstrate financial capability, and demonstrate technical and operational capability. The supporting documents listed in subsection 1.2.2 of this module must also be submitted through the online application system as instructed in the relevant questions.

Applicants must also submit their evaluation fees during this period. Refer to Section 1.5 of this module for additional information about fees and payments.

Each application slot is for one gTLD. An applicant may submit as many applications as desired; however, there is no means to apply for more than one gTLD in a single application.
Following the close of the application submission period, ICANN will provide applicants with periodic status updates on the progress of their applications.

1.1.2.2 Administrative Completeness Check

Immediately following the close of the application submission period, ICANN will begin checking all applications for completeness. This check ensures that:

- All mandatory questions are answered;
- Required supporting documents are provided in the proper format(s); and
- The evaluation fees have been received.

ICANN will post the public portions of all applications considered complete and ready for evaluation within two weeks of the close of the application submission period. Certain questions relate to internal processes or information: applicant responses to these questions will not be posted. Each question is labeled in the application form as to whether the information will be posted. See posting designations for the full set of questions in the attachment to Module 2.

The administrative completeness check is expected to be completed for all applications in a period of approximately 8 weeks, subject to extension depending on volume. In the event that all applications cannot be processed within this period, ICANN will post updated process information and an estimated timeline.

1.1.2.3 Comment Period

Public comment mechanisms are part of ICANN’s policy development, implementation, and operational processes. As a private-public partnership, ICANN is dedicated to: preserving the operational security and stability of the Internet, promoting competition, achieving broad representation of global Internet communities, and developing policy appropriate to its mission through bottom-up, consensus-based processes. This necessarily involves the participation of many stakeholder groups in a public discussion.

ICANN will open a comment period (the Application Comment period) at the time applications are publicly posted on ICANN’s website (refer to subsection 1.1.2.2). This period will allow time for the community to review and submit comments on posted application materials.
The comment forum will require commenters to associate comments with specific applications and the relevant panel. Application comments received within a 60-day period from the posting of the application materials will be available to the evaluation panels performing the Initial Evaluation reviews. This period is subject to extension, should the volume of applications or other circumstances require. To be considered by evaluators, comments must be received in the designated comment forum within the stated time period.

Evaluators will perform due diligence on the application comments (i.e., determine their relevance to the evaluation, verify the accuracy of claims, analyze meaningfulness of references cited) and take the information provided in these comments into consideration. In cases where consideration of the comments has impacted the scoring of the application, the evaluators will seek clarification from the applicant. Statements concerning consideration of application comments that have impacted the evaluation decision will be reflected in the evaluators’ summary reports, which will be published at the end of Extended Evaluation.

Comments received after the 60-day period will be stored and available (along with comments received during the comment period) for other considerations, such as the dispute resolution process, as described below.

In the new gTLD application process, all applicants should be aware that comment fora are a mechanism for the public to bring relevant information and issues to the attention of those charged with handling new gTLD applications. Anyone may submit a comment in a public comment forum.

Comments and the Formal Objection Process: A distinction should be made between application comments, which may be relevant to ICANN’s task of determining whether applications meet the established criteria, and formal objections that concern matters outside those evaluation criteria. The formal objection process was created to allow a full and fair consideration of objections based on certain limited grounds outside ICANN’s evaluation of applications on their merits (see subsection 3.2).

Public comments will not be considered as formal objections. Comments on matters associated with formal objections will not be considered by panels during Initial Evaluation. These comments will be available to and may
be subsequently considered by an expert panel during a dispute resolution proceeding (see subsection 1.1.2.9). However, in general, application comments have a very limited role in the dispute resolution process.

**String Contention:** Comments designated for the Community Priority Panel, as relevant to the criteria in Module 4, may be taken into account during a Community Priority Evaluation.

**Government Notifications:** Governments may provide a notification using the application comment forum to communicate concerns relating to national laws. However, a government’s notification of concern will not in itself be deemed to be a formal objection. A notification by a government does not constitute grounds for rejection of a gTLD application. A government may elect to use this comment mechanism to provide such a notification, in addition to or as an alternative to the GAC Early Warning procedure described in subsection 1.1.2.4 below.

Governments may also communicate directly to applicants using the contact information posted in the application, e.g., to send a notification that an applied-for gTLD string might be contrary to a national law, and to try to address any concerns with the applicant.

**General Comments:** A general public comment forum will remain open through all stages of the evaluation process, to provide a means for the public to bring forward any other relevant information or issues.

### 1.1.2.4 GAC Early Warning

Concurrent with the 60-day comment period, ICANN’s Governmental Advisory Committee (GAC) may issue a GAC Early Warning notice concerning an application. This provides the applicant with an indication that the application is seen as potentially sensitive or problematic by one or more governments.

The GAC Early Warning is a notice only. It is not a formal objection, nor does it directly lead to a process that can result in rejection of the application. However, a GAC Early Warning should be taken seriously as it raises the likelihood that the application could be the subject of GAC Advice on New gTLDs (see subsection 1.1.2.7) or of a formal objection (see subsection 1.1.2.6) at a later stage in the process.
A GAC Early Warning typically results from a notice to the GAC by one or more governments that an application might be problematic, e.g., potentially violate national law or raise sensitivities. A GAC Early Warning may be issued for any reason.\(^1\) The GAC may then send that notice to the Board – constituting the GAC Early Warning. ICANN will notify applicants of GAC Early Warnings as soon as practicable after receipt from the GAC. The GAC Early Warning notice may include a nominated point of contact for further information.

GAC consensus is not required for a GAC Early Warning to be issued. Minimally, the GAC Early Warning must be provided in writing to the ICANN Board, and be clearly labeled as a GAC Early Warning. This may take the form of an email from the GAC Chair to the ICANN Board. For GAC Early Warnings to be most effective, they should include the reason for the warning and identify the objecting countries.

Upon receipt of a GAC Early Warning, the applicant may elect to withdraw the application for a partial refund (see subsection 1.5.1), or may elect to continue with the application (this may include meeting with representatives from the relevant government(s) to try to address the concern). To qualify for the refund described in subsection 1.5.1, the applicant must provide notification to ICANN of its election to withdraw the application within 21 calendar days of the date of GAC Early Warning delivery to the applicant.

To reduce the possibility of a GAC Early Warning, all applicants are encouraged to identify potential sensitivities in advance of application submission, and to work with the relevant parties (including governments) beforehand to mitigate concerns related to the application.

1.1.2.5 Initial Evaluation

Initial Evaluation will begin immediately after the administrative completeness check concludes. All complete applications will be reviewed during Initial Evaluation. At the beginning of this period, background screening on the applying entity and the individuals named in the application will be conducted. Applications

\(^1\) While definitive guidance has not been issued, the GAC has indicated that strings that could raise sensitivities include those that "purport to represent or that embody a particular group of people or interests based on historical, cultural, or social components of identity, such as nationality, race or ethnicity, religion, belief, culture or particular social origin or group, political opinion, membership of a national minority, disability, age, and/or a language or linguistic group (non-exhaustive)" and "those strings that refer to particular sectors, such as those subject to national regulation (such as .bank, .pharmacy) or those that describe or are targeted to a population or industry that is vulnerable to online fraud or abuse."
must pass this step in conjunction with the Initial Evaluation reviews.

There are two main elements of the Initial Evaluation:

1. **String reviews (concerning the applied-for gTLD string).** String reviews include a determination that the applied-for gTLD string is not likely to cause security or stability problems in the DNS, including problems caused by similarity to existing TLDs or reserved names.

2. **Applicant reviews (concerning the entity applying for the gTLD and its proposed registry services).** Applicant reviews include a determination of whether the applicant has the requisite technical, operational, and financial capabilities to operate a registry.

By the conclusion of the Initial Evaluation period, ICANN will post notice of all Initial Evaluation results. Depending on the volume of applications received, such notices may be posted in batches over the course of the Initial Evaluation period.

The Initial Evaluation is expected to be completed for all applications in a period of approximately 5 months. If the volume of applications received significantly exceeds 500, applications will be processed in batches and the 5-month timeline will not be met. The first batch will be limited to 500 applications and subsequent batches will be limited to 400 to account for capacity limitations due to managing extended evaluation, string contention, and other processes associated with each previous batch.

If batching is required, a secondary time-stamp process will be employed to establish the batches. (Batching priority will not be given to an application based on the time at which the application was submitted to ICANN, nor will batching priority be established based on a random selection method.)

The secondary time-stamp process will require applicants to obtain a time-stamp through a designated process which will occur after the close of the application submission period. The secondary time stamp process will occur, if required, according to the details to be published on ICANN’s website. (Upon the Board’s approval of a final designation of the operational details of the “secondary timestamp” batching process, the final plan will be added as a process within the Applicant Guidebook.)
If batching is required, the String Similarity review will be completed on all applications prior to the establishment of evaluation priority batches. For applications identified as part of a contention set, the entire contention set will be kept together in the same batch.

If batches are established, ICANN will post updated process information and an estimated timeline.

Note that the processing constraints will limit delegation rates to a steady state even in the event of an extremely high volume of applications. The annual delegation rate will not exceed 1,000 per year in any case, no matter how many applications are received.²

1.1.2.6 Objection Filing

Formal objections to applications can be filed on any of four enumerated grounds, by parties with standing to object. The objection filing period will open after ICANN posts the list of complete applications as described in subsection 1.1.2.2, and will last for approximately 7 months.

Objectors must file such formal objections directly with dispute resolution service providers (DRSPs), not with ICANN. The objection filing period will close following the end of the Initial Evaluation period (refer to subsection 1.1.2.5), with a two-week window of time between the posting of the Initial Evaluation results and the close of the objection filing period. Objections that have been filed during the objection filing period will be addressed in the dispute resolution stage, which is outlined in subsection 1.1.2.9 and discussed in detail in Module 3.

All applicants should be aware that third parties have the opportunity to file objections to any application during the objection filing period. Applicants whose applications are the subject of a formal objection will have an opportunity to file a response according to the dispute resolution service provider’s rules and procedures. An applicant wishing to file a formal objection to another application that has been submitted would do so within the objection filing period, following the objection filing procedures in Module 3.

Applicants are encouraged to identify possible regional, cultural, property interests, or other sensitivities regarding TLD strings and their uses before applying and, where

possible, consult with interested parties to mitigate any concerns in advance.

1.1.2.7 Receipt of GAC Advice on New gTLDs

The GAC may provide public policy advice directly to the ICANN Board on any application. The procedure for GAC Advice on New gTLDs described in Module 3 indicates that, to be considered by the Board during the evaluation process, the GAC Advice on New gTLDs must be submitted by the close of the objection filing period. A GAC Early Warning is not a prerequisite to use of the GAC Advice process.

If the Board receives GAC Advice on New gTLDs stating that it is the consensus of the GAC that a particular application should not proceed, this will create a strong presumption for the ICANN Board that the application should not be approved. If the Board does not act in accordance with this type of advice, it must provide rationale for doing so.

See Module 3 for additional detail on the procedures concerning GAC Advice on New gTLDs.

1.1.2.8 Extended Evaluation

Extended Evaluation is available only to certain applicants that do not pass Initial Evaluation.

Applicants failing certain elements of the Initial Evaluation can request an Extended Evaluation. If the applicant does not pass Initial Evaluation and does not expressly request an Extended Evaluation, the application will proceed no further. The Extended Evaluation period allows for an additional exchange of information between the applicant and evaluators to clarify information contained in the application. The reviews performed in Extended Evaluation do not introduce additional evaluation criteria.

An application may be required to enter an Extended Evaluation if one or more proposed registry services raise technical issues that might adversely affect the security or stability of the DNS. The Extended Evaluation period provides a time frame for these issues to be investigated. Applicants will be informed if such a review is required by the end of the Initial Evaluation period.

Evaluators and any applicable experts consulted will communicate the conclusions resulting from the additional review by the end of the Extended Evaluation period.
At the conclusion of the Extended Evaluation period, ICANN will post summary reports, by panel, from the Initial and Extended Evaluation periods.

If an application passes the Extended Evaluation, it can then proceed to the next relevant stage. If the application does not pass the Extended Evaluation, it will proceed no further.

The Extended Evaluation is expected to be completed for all applications in a period of approximately 5 months, though this timeframe could be increased based on volume. In this event, ICANN will post updated process information and an estimated timeline.

1.1.2.9 Dispute Resolution

Dispute resolution applies only to applicants whose applications are the subject of a formal objection.

Where formal objections are filed and filing fees paid during the objection filing period, independent dispute resolution service providers (DRSPs) will initiate and conclude proceedings based on the objections received. The formal objection procedure exists to provide a path for those who wish to object to an application that has been submitted to ICANN. Dispute resolution service providers serve as the fora to adjudicate the proceedings based on the subject matter and the needed expertise. Consolidation of objections filed will occur where appropriate, at the discretion of the DRSP.

As a result of a dispute resolution proceeding, either the applicant will prevail (in which case the application can proceed to the next relevant stage), or the objector will prevail (in which case either the application will proceed no further or the application will be bound to a contention resolution procedure). In the event of multiple objections, an applicant must prevail in all dispute resolution proceedings concerning the application to proceed to the next relevant stage. Applicants will be notified by the DRSP(s) of the results of dispute resolution proceedings.

Dispute resolution proceedings, where applicable, are expected to be completed for all applications within approximately a 5-month time frame. In the event that volume is such that this timeframe cannot be accommodated, ICANN will work with the dispute resolution service providers to create processing procedures and post updated timeline information.
1.1.2.10 String Contention

String contention applies only when there is more than one qualified application for the same or similar gTLD strings.

String contention refers to the scenario in which there is more than one qualified application for the identical gTLD string or for similar gTLD strings. In this Applicant Guidebook, “similar” means strings so similar that they create a probability of user confusion if more than one of the strings is delegated into the root zone.

Applicants are encouraged to resolve string contention cases among themselves prior to the string contention resolution stage. In the absence of resolution by the contending applicants, string contention cases are resolved either through a community priority evaluation (if a community-based applicant elects it) or through an auction.

In the event of contention between applied-for gTLD strings that represent geographic names, the parties may be required to follow a different process to resolve the contention. See subsection 2.2.1.4 of Module 2 for more information.

Groups of applied-for strings that are either identical or similar are called contention sets. All applicants should be aware that if an application is identified as being part of a contention set, string contention resolution procedures will not begin until all applications in the contention set have completed all aspects of evaluation, including dispute resolution, if applicable.

To illustrate, as shown in Figure 1-2, Applicants A, B, and C all apply for .EXAMPLE and are identified as a contention set. Applicants A and C pass Initial Evaluation, but Applicant B does not. Applicant B requests Extended Evaluation. A third party files an objection to Applicant C’s application, and Applicant C enters the dispute resolution process. Applicant A must wait to see whether Applicants B and C successfully complete the Extended Evaluation and dispute resolution phases, respectively, before it can proceed to the string contention resolution stage. In this example, Applicant B passes the Extended Evaluation, but Applicant C does not prevail in the dispute resolution proceeding. String contention resolution then proceeds between Applicants A and B.
Applicants prevailing in a string contention resolution procedure will proceed toward delegation of the applied-for gTLDs.

String contention resolution for a contention set is estimated to take from 2.5 to 6 months to complete. The time required will vary per case because some contention cases may be resolved in either a community priority evaluation or an auction, while others may require both processes.

1.1.2.11 Transition to Delegation

Applicants successfully completing all the relevant stages outlined in this subsection 1.1.2 are required to carry out a series of concluding steps before delegation of the applied-for gTLD into the root zone. These steps include execution of a registry agreement with ICANN and completion of a pre-delegation technical test to validate information provided in the application.

Following execution of a registry agreement, the prospective registry operator must complete technical set-up and show satisfactory performance on a set of technical tests before delegation of the gTLD into the root zone may be initiated. If the pre-delegation testing requirements are not satisfied so that the gTLD can be delegated into the root zone within the time frame specified in the registry agreement, ICANN may in its sole and absolute discretion elect to terminate the registry agreement.
Once all of these steps have been successfully completed, the applicant is eligible for delegation of its applied-for gTLD into the DNS root zone.

It is expected that the transition to delegation steps can be completed in approximately 2 months, though this could take more time depending on the applicant’s level of preparedness for the pre-delegation testing and the volume of applications undergoing these steps concurrently.

1.1.3 Lifecycle Timelines

Based on the estimates for each stage described in this section, the lifecycle for a straightforward application could be approximately 9 months, as follows:

- **Initial Evaluation**: 5 Months
- **Administrative Check**: 2 Months
- **Transition to Delegation**: 2 Months

Figure 1-3 – A straightforward application could have an approximate 9-month lifecycle.

The lifecycle for a highly complex application could be much longer, such as 20 months in the example below:
1.1.4 Posting Periods

The results of application reviews will be made available to the public at various stages in the process, as shown below.

<table>
<thead>
<tr>

### 1.1.5 Sample Application Scenarios

The following scenarios briefly show a variety of ways in which an application may proceed through the evaluation process. The table that follows exemplifies various processes and outcomes. This is not intended to be an exhaustive list of possibilities. There are other possible combinations of paths an application could follow.

Estimated time frames for each scenario are also included, based on current knowledge. Actual time frames may vary depending on several factors, including the total number...
of applications received by ICANN during the application submission period. It should be emphasized that most applications are expected to pass through the process in the shortest period of time, i.e., they will not go through extended evaluation, dispute resolution, or string contention resolution processes. Although most of the scenarios below are for processes extending beyond nine months, it is expected that most applications will complete the process within the nine-month timeframe.

<table>
<thead>
<tr>

</table>

**Scenario 1 - Pass Initial Evaluation, No Objection, No Contention** - In the most straightforward case, the application passes Initial Evaluation and there is no need for an Extended Evaluation. No objections are filed during the objection period, so there is no dispute to resolve. As there is no contention for the applied-for gTLD string, the applicant can enter into a registry agreement and the application can proceed toward delegation of the applied-for gTLD. Most applications are expected to complete the process within this timeframe.

**Scenario 2 - Extended Evaluation, No Objection, No Contention** - In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. As with Scenario 1, no objections are filed.
during the objection period, so there is no dispute to resolve. As there is no contention for the gTLD string, the applicant can enter into a registry agreement and the application can proceed toward delegation of the applied-for gTLD.

Scenario 3 - Pass Initial Evaluation, No Objection, Contention - In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. No objections are filed during the objection period, so there is no dispute to resolve. However, there are other applications for the same or a similar gTLD string, so there is contention. In this case, the application prevails in the contention resolution, so the applicant can enter into a registry agreement and the application can proceed toward delegation of the applied-for gTLD.

Scenario 4 - Pass Initial Evaluation, Win Objection, No Contention - In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. During the objection filing period, an objection is filed on one of the four enumerated grounds by an objector with standing (refer to Module 3, Objection Procedures). The objection is heard by a dispute resolution service provider panel that finds in favor of the applicant. The applicant can enter into a registry agreement and the application can proceed toward delegation of the applied-for gTLD.

Scenario 5 - Pass Initial Evaluation, Lose Objection - In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. During the objection period, multiple objections are filed by one or more objectors with standing for one or more of the four enumerated objection grounds. Each objection is heard by a dispute resolution service provider panel. In this case, the panels find in favor of the applicant for most of the objections, but one finds in favor of the objector. As one of the objections has been upheld, the application does not proceed.

Scenario 6 - Fail Initial Evaluation, Applicant Withdraws - In this case, the application fails one or more aspects of the Initial Evaluation. The applicant decides to withdraw the application rather than continuing with Extended Evaluation. The application does not proceed.

Scenario 7 - Fail Initial Evaluation, Fail Extended Evaluation - In this case, the application fails one or more aspects of the Initial Evaluation. The applicant requests Extended Evaluation for the appropriate elements. However, the
application fails Extended Evaluation also. The application does not proceed.

**Scenario 8 - Extended Evaluation, Win Objection, Pass Contention** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. During the objection filing period, an objection is filed on one of the four enumerated grounds by an objector with standing. The objection is heard by a dispute resolution service provider panel that finds in favor of the applicant. However, there are other applications for the same or a similar gTLD string, so there is contention. In this case, the applicant prevails over other applications in the contention resolution procedure, the applicant can enter into a registry agreement, and the application can proceed toward delegation of the applied-for gTLD.

**Scenario 9 - Extended Evaluation, Objection, Fail Contention** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. During the objection filing period, an objection is filed on one of the four enumerated grounds by an objector with standing. The objection is heard by a dispute resolution service provider that finds in favor of the applicant. However, there are other applications for the same or a similar gTLD string, so there is contention. In this case, another applicant prevails in the contention resolution procedure, and the application does not proceed.

**Transition to Delegation** – After an application has successfully completed Initial Evaluation, and other stages as applicable, the applicant is required to complete a set of steps leading to delegation of the gTLD, including execution of a registry agreement with ICANN, and completion of pre-delegation testing. Refer to Module 5 for a description of the steps required in this stage.

### 1.1.6 Subsequent Application Rounds

ICANN's goal is to launch subsequent gTLD application rounds as quickly as possible. The exact timing will be based on experiences gained and changes required after this round is completed. The goal is for the next application round to begin within one year of the close of the application submission period for the initial round.
ICANN has committed to reviewing the effects of the New gTLD Program on the operations of the root zone system after the first application round, and will defer the delegations in a second application round until it is determined that the delegations resulting from the first round did not jeopardize root zone system security or stability.

It is the policy of ICANN that there be subsequent application rounds, and that a systemized manner of applying for gTLDs be developed in the long term.

1.2 Information for All Applicants

1.2.1 Eligibility

Established corporations, organizations, or institutions in good standing may apply for a new gTLD. Applications from individuals or sole proprietorships will not be considered. Applications from or on behalf of yet-to-be-formed legal entities, or applications presupposing the future formation of a legal entity (for example, a pending Joint Venture) will not be considered.

ICANN has designed the New gTLD Program with multiple stakeholder protection mechanisms. Background screening, features of the gTLD Registry Agreement, data and financial escrow mechanisms are all intended to provide registrant and user protections.

The application form requires applicants to provide information on the legal establishment of the applying entity, as well as the identification of directors, officers, partners, and major shareholders of that entity. The names and positions of individuals included in the application will be published as part of the application; other information collected about the individuals will not be published.

Background screening at both the entity level and the individual level will be conducted for all applications to confirm eligibility. This inquiry is conducted on the basis of the information provided in questions 1-11 of the application form. ICANN may take into account information received from any source if it is relevant to the criteria in this section. If requested by ICANN, all applicants will be required to obtain and deliver to ICANN and ICANN's background screening vendor any consents or agreements of the entities and/or individuals named in questions 1-11 of the application form necessary to conduct background screening activities.
ICANN will perform background screening in only two areas: (1) General business diligence and criminal history; and (2) History of cybersquatting behavior. The criteria used for criminal history are aligned with the “crimes of trust” standard sometimes used in the banking and finance industry.

In the absence of exceptional circumstances, applications from any entity with or including any individual with convictions or decisions of the types listed in (a) - (m) below will be automatically disqualified from the program.

a. within the past ten years, has been convicted of any crime related to financial or corporate governance activities, or has been judged by a court to have committed fraud or breach of fiduciary duty, or has been the subject of a judicial determination that ICANN deems as the substantive equivalent of any of these;

b. within the past ten years, has been disciplined by any government or industry regulatory body for conduct involving dishonesty or misuse of the funds of others;

c. within the past ten years has been convicted of any willful tax-related fraud or willful evasion of tax liabilities;

d. within the past ten years has been convicted of perjury, forswearing, failing to cooperate with a law enforcement investigation, or making false statements to a law enforcement agency or representative;

e. has ever been convicted of any crime involving the use of computers, telephony systems, telecommunications or the Internet to facilitate the commission of crimes;

f. has ever been convicted of any crime involving the use of a weapon, force, or the threat of force;

g. has ever been convicted of any violent or sexual offense victimizing children, the
h. has ever been convicted of the illegal sale, manufacture, or distribution of pharmaceutical drugs, or been convicted or successfully extradited for any offense described in Article 3 of the United Nations Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances of 1988;  

i. has ever been convicted or successfully extradited for any offense described in the United Nations Convention against Transnational Organized Crime (all Protocols);  

j. has been convicted, within the respective timeframes, of aiding, abetting, facilitating, enabling, conspiring to commit, or failing to report any of the listed crimes above (i.e., within the past 10 years for crimes listed in (a) - (d) above, or ever for the crimes listed in (e) - (i) above);  

k. has entered a guilty plea as part of a plea agreement or has a court case in any jurisdiction with a disposition of Adjudicated Guilty or Adjudication Withheld (or regional equivalents), within the respective timeframes listed above for any of the listed crimes (i.e., within the past 10 years for crimes listed in (a) - (d) above, or ever for the crimes listed in (e) - (i) above);  

l. is the subject of a disqualification imposed by ICANN and in effect at the time the application is considered;  

m. has been involved in a pattern of adverse, final decisions indicating that the applicant  

---

5 It is recognized that not all countries have signed on to the UN conventions referenced above. These conventions are being used solely for identification of a list of crimes for which background screening will be performed. It is not necessarily required that an applicant would have been convicted pursuant to the UN convention but merely convicted of a crime listed under these conventions, to trigger these criteria.
or individual named in the application was engaged in cybersquatting as defined in the Uniform Domain Name Dispute Resolution Policy (UDRP), the Anti-Cybersquatting Consumer Protection Act (ACPA), or other equivalent legislation, or was engaged in reverse domain name hijacking under the UDRP or bad faith or reckless disregard under the ACPA or other equivalent legislation. Three or more such decisions with one occurring in the last four years will generally be considered to constitute a pattern.

n. fails to provide ICANN with the identifying information necessary to confirm identity at the time of application or to resolve questions of identity during the background screening process;

o. fails to provide a good faith effort to disclose all relevant information relating to items (a) – (m).

Background screening is in place to protect the public interest in the allocation of critical Internet resources, and ICANN reserves the right to deny an otherwise qualified application based on any information identified during the background screening process. For example, a final and legally binding decision obtained by a national law enforcement or consumer protection authority finding that the applicant was engaged in fraudulent and deceptive commercial practices as defined in the Organization for Economic Co-operation and Development (OECD) Guidelines for Protecting Consumers from Fraudulent and Deceptive Commercial Practices Across Borders6 may cause an application to be rejected. ICANN may also contact the applicant with additional questions based on information obtained in the background screening process.

All applicants are required to provide complete and detailed explanations regarding any of the above events as part of the application. Background screening information will not be made publicly available by ICANN.

Registrar Cross-Ownership -- ICANN-accredited registrars are eligible to apply for a gTLD. However, all gTLD registries

6 http://www.oecd.org/document/56/0,3746,en_2649_34267_2515000_1_1_1_100.html
are required to abide by a Code of Conduct addressing, inter alia, non-discriminatory access for all authorized registrars. ICANN reserves the right to refer any application to the appropriate competition authority relative to any cross-ownership issues.

**Legal Compliance** -- ICANN must comply with all U.S. laws, rules, and regulations. One such set of regulations is the economic and trade sanctions program administered by the Office of Foreign Assets Control (OFAC) of the U.S. Department of the Treasury. These sanctions have been imposed on certain countries, as well as individuals and entities that appear on OFAC's List of Specially Designated Nationals and Blocked Persons (the SDN List). ICANN is prohibited from providing most goods or services to residents of sanctioned countries or their governmental entities or to SDNs without an applicable U.S. government authorization or exemption. ICANN generally will not seek a license to provide goods or services to an individual or entity on the SDN List. In the past, when ICANN has been requested to provide services to individuals or entities that are not SDNs, but are residents of sanctioned countries, ICANN has sought and been granted licenses as required. In any given case, however, OFAC could decide not to issue a requested license.

### 1.2.2 Required Documents

All applicants should be prepared to submit the following documents, which are required to accompany each application:

1. **Proof of legal establishment** - Documentation of the applicant's establishment as a specific type of entity in accordance with the applicable laws of its jurisdiction.

2. **Financial statements** - Applicants must provide audited or independently certified financial statements for the most recently completed fiscal year for the applicant. In some cases, unaudited financial statements may be provided.

As indicated in the relevant questions, supporting documentation should be submitted in the original language. English translations are not required.

All documents must be valid at the time of submission. Refer to the Evaluation Criteria, attached to Module 2, for additional details on the requirements for these documents.
Some types of supporting documentation are required only in certain cases:

1. **Community endorsement** – If an applicant has designated its application as community-based (see section 1.2.3), it will be asked to submit a written endorsement of its application by one or more established institutions representing the community it has named. An applicant may submit written endorsements from multiple institutions. If applicable, this will be submitted in the section of the application concerning the community-based designation.

   At least one such endorsement is required for a complete application. The form and content of the endorsement are at the discretion of the party providing the endorsement; however, the letter must identify the applied-for gTLD string and the applying entity, include an express statement of support for the application, and supply the contact information of the entity providing the endorsement.

   Written endorsements from individuals need not be submitted with the application, but may be submitted in the application comment forum.

2. **Government support or non-objection** – If an applicant has applied for a gTLD string that is a geographic name (as defined in this Guidebook), the applicant is required to submit documentation of support for or non-objection to its application from the relevant governments or public authorities. Refer to subsection 2.2.1.4 for more information on the requirements for geographic names. If applicable, this will be submitted in the geographic names section of the application.

3. **Documentation of third-party funding commitments** – If an applicant lists funding from third parties in its application, it must provide evidence of commitment by the party committing the funds. If applicable, this will be submitted in the financial section of the application.

### 1.2.3 Community-Based Designation

All applicants are required to designate whether their application is community-based.

#### 1.2.3.1 Definitions

For purposes of this Applicant Guidebook, a **community-based gTLD** is a gTLD that is operated for the benefit of a clearly delineated community. Designation or non-
designation of an application as community-based is entirely at the discretion of the applicant. Any applicant may designate its application as community-based; however, each applicant making this designation is asked to substantiate its status as representative of the community it names in the application by submission of written endorsements in support of the application. Additional information may be requested in the event of a community priority evaluation (refer to section 4.2 of Module 4). An applicant for a community-based gTLD is expected to:

1. Demonstrate an ongoing relationship with a clearly delineated community.
2. Have applied for a gTLD string strongly and specifically related to the community named in the application.
3. Have proposed dedicated registration and use policies for registrants in its proposed gTLD, including appropriate security verification procedures, commensurate with the community-based purpose it has named.
4. Have its application endorsed in writing by one or more established institutions representing the community it has named.

For purposes of differentiation, an application that has not been designated as community-based will be referred to hereinafter in this document as a **standard application**. A standard gTLD can be used for any purpose consistent with the requirements of the application and evaluation criteria, and with the registry agreement. A standard applicant may or may not have a formal relationship with an exclusive registrant or user population. It may or may not employ eligibility or use restrictions. Standard simply means here that the applicant has not designated the application as community-based.

### 1.2.3.2 Implications of Application Designation

Applicants should understand how their designation as community-based or standard will affect application processing at particular stages, and, if the application is successful, execution of the registry agreement and subsequent obligations as a gTLD registry operator, as described in the following paragraphs.

**Objection / Dispute Resolution** - All applicants should understand that a formal objection may be filed against any application on community grounds, even if the applicant has not designated itself as community-based or
declared the gTLD to be aimed at a particular community. Refer to Module 3, Objection Procedures.

**String Contention** – Resolution of string contention may include one or more components, depending on the composition of the contention set and the elections made by community-based applicants.

- A *settlement between the parties* can occur at any time after contention is identified. The parties will be encouraged to meet with an objective to settle the contention. Applicants in contention always have the opportunity to resolve the contention voluntarily, resulting in the withdrawal of one or more applications, before reaching the contention resolution stage.

- A *community priority evaluation* will take place only if a community-based applicant in a contention set elects this option. All community-based applicants in a contention set will be offered this option in the event that there is contention remaining after the applications have successfully completed all previous evaluation stages.

- An *auction* will result for cases of contention not resolved by community priority evaluation or agreement between the parties. Auction occurs as a contention resolution means of last resort. If a community priority evaluation occurs but does not produce a clear winner, an auction will take place to resolve the contention.

Refer to Module 4, String Contention Procedures, for detailed discussions of contention resolution procedures.

**Contract Execution and Post-Delegation** – A community-based applicant will be subject to certain post-delegation contractual obligations to operate the gTLD in a manner consistent with the restrictions associated with its community-based designation. Material changes to the contract, including changes to the community-based nature of the gTLD and any associated provisions, may only be made with ICANN’s approval. The determination of whether to approve changes requested by the applicant will be at ICANN’s discretion. Proposed criteria for approving such changes are the subject of policy discussions.

Community-based applications are intended to be a narrow category, for applications where there are
unambiguous associations among the applicant, the community served, and the applied-for gTLD string. Evaluation of an applicant’s designation as community-based will occur only in the event of a contention situation that results in a community priority evaluation. However, any applicant designating its application as community-based will, if the application is approved, be bound by the registry agreement to implement the community-based restrictions it has specified in the application. This is true even if there are no contending applicants.

1.2.3.3 Changes to Application Designation

An applicant may not change its designation as standard or community-based once it has submitted a gTLD application for processing.

1.2.4 Notice concerning Technical Acceptance Issues with New gTLDs

All applicants should be aware that approval of an application and entry into a registry agreement with ICANN do not guarantee that a new gTLD will immediately function throughout the Internet. Past experience indicates that network operators may not immediately fully support new top-level domains, even when these domains have been delegated in the DNS root zone, since third-party software modification may be required and may not happen immediately.

Similarly, software applications sometimes attempt to validate domain names and may not recognize new or unknown top-level domains. ICANN has no authority or ability to require that software accept new top-level domains, although it does prominently publicize which top-level domains are valid and has developed a basic tool to assist application providers in the use of current root-zone data.

ICANN encourages applicants to familiarize themselves with these issues and account for them in their startup and launch plans. Successful applicants may find themselves expending considerable efforts working with providers to achieve acceptance of their new top-level domains.

Applicants should review [http://www.icann.org/en/topics/TLD-acceptance/](http://www.icann.org/en/topics/TLD-acceptance/) for background. IDN applicants should also review the material concerning experiences with IDN test strings in the root zone (see [http://idn.icann.org/](http://idn.icann.org/)).
1.2.5 Notice concerning TLD Delegations

ICANN is only able to create TLDs as delegations in the DNS root zone, expressed using NS records with any corresponding DS records and glue records. There is no policy enabling ICANN to place TLDs as other DNS record types (such as A, MX, or DNAME records) in the root zone.

1.2.6 Terms and Conditions

All applicants must agree to a standard set of Terms and Conditions for the application process. The Terms and Conditions are available in Module 6 of this guidebook.

1.2.7 Notice of Changes to Information

If at any time during the evaluation process information previously submitted by an applicant becomes untrue or inaccurate, the applicant must promptly notify ICANN via submission of the appropriate forms. This includes applicant-specific information such as changes in financial position and changes in ownership or control of the applicant.

ICANN reserves the right to require a re-evaluation of the application in the event of a material change. This could involve additional fees or evaluation in a subsequent application round.

Failure to notify ICANN of any change in circumstances that would render any information provided in the application false or misleading may result in denial of the application.

1.2.8 Voluntary Designation for High Security Zones

The Final Report may be used to inform further work. ICANN will support independent efforts toward developing voluntary high-security TLD designations, which may be available to gTLD applicants wishing to pursue such designations.

1.2.9 Security and Stability

Root Zone Stability: There has been significant study, analysis, and consultation in preparation for launch of the
New gTLD Program, indicating that the addition of gTLDs to the root zone will not negatively impact the security or stability of the DNS.

It is estimated that 200-300 TLDs will be delegated annually, and determined that in no case will more than 1000 new gTLDs be added to the root zone in a year. The delegation rate analysis, consultations with the technical community, and anticipated normal operational upgrade cycles all lead to the conclusion that the new gTLD delegations will have no significant impact on the stability of the root system. Modeling and reporting will continue during, and after, the first application round so that root-scaling discussions can continue and the delegation rates can be managed as the program goes forward.

All applicants should be aware that delegation of any new gTLDs is conditional on the continued absence of significant negative impact on the security or stability of the DNS and the root zone system (including the process for delegating TLDs in the root zone). In the event that there is a reported impact in this regard and processing of applications is delayed, the applicants will be notified in an orderly and timely manner.

1.2.10 Resources for Applicant Assistance

A variety of support resources are available to gTLD applicants. Financial assistance will be available to a limited number of eligible applicants. To request financial assistance, applicants must submit a separate financial assistance application in addition to the gTLD application form.

To be eligible for consideration, all financial assistance applications must be received by 23:59 UTC 12 April 2012. Financial assistance applications will be evaluated and scored against pre-established criteria.

In addition, ICANN maintains a webpage as an informational resource for applicants seeking assistance, and organizations offering support.

See http://newgtlds.icann.org/applicants/candidate-support for details on these resources.

1.2.11 Updates to the Applicant Guidebook

As approved by the ICANN Board of Directors, this Guidebook forms the basis of the New gTLD Program. ICANN reserves the right to make reasonable updates and
changes to the Applicant Guidebook at any time, including as the possible result of new technical standards, reference documents, or policies that might be adopted during the course of the application process. Any such updates or revisions will be posted on ICANN’s website.

1.3 Information for Internationalized Domain Name Applicants

Some applied-for gTLD strings are expected to be Internationalized Domain Names (IDNs). IDNs are domain names including characters used in the local representation of languages not written with the basic Latin alphabet (a - z), European-Arabic digits (0 - 9), and the hyphen (-). As described below, IDNs require the insertion of A-labels into the DNS root zone.

1.3.1 IDN-Specific Requirements

An applicant for an IDN string must provide information indicating compliance with the IDNA protocol and other technical requirements. The IDNA protocol and its documentation can be found at http://icann.org/en/topics/idn/rfcs.htm.

Applicants must provide applied-for gTLD strings in the form of both a U-label (the IDN TLD in local characters) and an A-label.

An A-label is the ASCII form of an IDN label. Every IDN A-label begins with the IDNA ACE prefix, “xn--”, followed by a string that is a valid output of the Punycode algorithm, making a maximum of 63 total ASCII characters in length. The prefix and string together must conform to all requirements for a label that can be stored in the DNS including conformance to the LDH (host name) rule described in RFC 1034, RFC 1123, and elsewhere.

A U-label is the Unicode form of an IDN label, which a user expects to see displayed in applications.

For example, using the current IDN test string in Cyrillic script, the U-label is <испытание> and the A-label is <xn--80akhbyknj4f>. An A-label must be capable of being produced by conversion from a U-label and a U-label must be capable of being produced by conversion from an A-label.

Applicants for IDN gTLDs will also be required to provide the following at the time of the application:
1. Meaning or restatement of string in English. The applicant will provide a short description of what the string would mean or represent in English.

2. Language of label (ISO 639-1). The applicant will specify the language of the applied-for gTLD string, both according to the ISO codes for the representation of names of languages, and in English.

3. Script of label (ISO 15924). The applicant will specify the script of the applied-for gTLD string, both according to the ISO codes for the representation of names of scripts, and in English.

4. Unicode code points. The applicant will list all the code points contained in the U-label according to its Unicode form.

5. Applicants must further demonstrate that they have made reasonable efforts to ensure that the encoded IDN string does not cause any rendering or operational problems. For example, problems have been identified in strings with characters of mixed right-to-left and left-to-right directionality when numerals are adjacent to the path separator (i.e., the dot). If an applicant is applying for a string with known issues, it should document steps that will be taken to mitigate these issues in applications. While it is not possible to ensure that all rendering problems are avoided, it is important that as many as possible are identified early and that the potential registry operator is aware of these issues. Applicants can become familiar with these issues by understanding the IDNA protocol (see http://www.icann.org/en/topics/idn/rfcs.htm), and by active participation in the IDN wiki (see http://idn.icann.org/) where some rendering problems are demonstrated.

6. [Optional] - Representation of label in phonetic alphabet. The applicant may choose to provide its applied-for gTLD string notated according to the International Phonetic Alphabet (http://www.langsci.ucl.ac.uk/ipa/). Note that this information will not be evaluated or scored. The information, if provided, will be used as a guide to ICANN in responding to inquiries or speaking of the application in public presentations.

---

7 See examples at http://stupid.domain.name/node/683
1.3.2 IDN Tables

An IDN table provides the list of characters eligible for registration in domain names according to the registry’s policy. It identifies any multiple characters that are considered equivalent for domain name registration purposes (“variant characters”). Variant characters occur where two or more characters can be used interchangeably.

Examples of IDN tables can be found in the Internet Assigned Numbers Authority (IANA) IDN Repository at http://www.iana.org/procedures/idn-repository.html.

In the case of an application for an IDN gTLD, IDN tables must be submitted for the language or script for the applied-for gTLD string (the “top level tables”). IDN tables must also be submitted for each language or script in which the applicant intends to offer IDN registrations at the second or lower levels.

Each applicant is responsible for developing its IDN Tables, including specification of any variant characters. Tables must comply with ICANN’s IDN Guidelines and any updates thereto, including:

- Complying with IDN technical standards.
- Employing an inclusion-based approach (i.e., code points not explicitly permitted by the registry are prohibited).
- Defining variant characters.
- Excluding code points not permissible under the guidelines, e.g., line-drawing symbols, pictographic dingbats, structural punctuation marks.
- Developing tables and registration policies in collaboration with relevant stakeholders to address common issues.
- Depositing IDN tables with the IANA Repository for IDN Practices (once the TLD is delegated).

An applicant’s IDN tables should help guard against user confusion in the deployment of IDN gTLDs. Applicants are strongly urged to consider specific linguistic and writing system issues that may cause problems when characters are used in domain names, as part of their work of defining variant characters.

---

8 See http://www.icann.org/en/topics/idn/implementation-guidelines.htm
To avoid user confusion due to differing practices across TLD registries, it is recommended that applicants cooperate with TLD operators that offer domain name registration with the same or visually similar characters.

As an example, languages or scripts are often shared across geographic boundaries. In some cases, this can cause confusion among the users of the corresponding language or script communities. Visual confusion can also exist in some instances between different scripts (for example, Greek, Cyrillic and Latin).

Applicants will be asked to describe the process used in developing the IDN tables submitted. ICANN may compare an applicant’s IDN table with IDN tables for the same languages or scripts that already exist in the IANA repository or have been otherwise submitted to ICANN. If there are inconsistencies that have not been explained in the application, ICANN may ask the applicant to detail the rationale for differences. For applicants that wish to conduct and review such comparisons prior to submitting a table to ICANN, a table comparison tool will be available.

ICANN will accept the applicant’s IDN tables based on the factors above.

Once the applied-for string has been delegated as a TLD in the root zone, the applicant is required to submit IDN tables for lodging in the IANA Repository of IDN Practices. For additional information, see existing tables at http://iana.org/domains/idn-tables/, and submission guidelines at http://iana.org/procedures/idn-repository.html.

1.3.3 IDN Variant TLDs

A variant TLD string results from the substitution of one or more characters in the applied-for gTLD string with variant characters based on the applicant’s top level tables.

Each application contains one applied-for gTLD string. The applicant may also declare any variant strings for the TLD in its application. However, no variant gTLD strings will be delegated through the New gTLD Program until variant management solutions are developed and implemented.9 Declaring variant strings is informative only and will not imply any right or claim to the declared variant strings.

---

When a variant delegation process is established, applicants may be required to submit additional information such as implementation details for the variant TLD management mechanism, and may need to participate in a subsequent evaluation process, which could contain additional fees and review steps.

The following scenarios are possible during the gTLD evaluation process:

a. Applicant declares variant strings to the applied-for gTLD string in its application. If the application is successful, the applied-for gTLD string will be delegated to the applicant. The declared variant strings are noted for future reference. These declared variant strings will not be delegated to the applicant along with the applied-for gTLD string, nor will the applicant have any right or claim to the declared variant strings.

Variant strings listed in successful gTLD applications will be tagged to the specific application and added to a “Declared Variants List” that will be available on ICANN’s website. A list of pending (i.e., declared) variant strings from the IDN ccTLD Fast Track is available at http://icann.org/en/topics/idn/fast-track/string-evaluation-completion-en.htm.

ICANN may perform independent analysis on the declared variant strings, and will not necessarily include all strings listed by the applicant on the Declared Variants List.

b. Multiple applicants apply for strings that are identified by ICANN as variants of one another. These applications will be placed in a contention set and will follow the contention resolution procedures in Module 4.

c. Applicant submits an application for a gTLD string and does not indicate variants to the applied-for gTLD string. ICANN will not identify variant strings unless scenario (b) above occurs.

Each variant string declared in the application must also conform to the string requirements in section 2.2.1.3.2.

Variant strings declared in the application will be reviewed for consistency with the top-level tables submitted in the application. Should any declared variant strings not be
based on use of variant characters according to the submitted top-level tables, the applicant will be notified and the declared string will no longer be considered part of the application.

Declaration of variant strings in an application does not provide the applicant any right or reservation to a particular string. Variant strings on the Declared Variants List may be subject to subsequent additional review per a process and criteria to be defined.

It should be noted that while variants for second and lower-level registrations are defined freely by the local communities without any ICANN validation, there may be specific rules and validation criteria specified for variant strings to be allowed at the top level. It is expected that the variant information provided by applicants in the first application round will contribute to a better understanding of the issues and assist in determining appropriate review steps and fee levels going forward.

1.4 Submitting an Application

Applicants may complete the application form and submit supporting documents using ICANN’s TLD Application System (TAS). To access the system, each applicant must first register as a TAS user.

As TAS users, applicants will be able to provide responses in open text boxes and submit required supporting documents as attachments. Restrictions on the size of attachments as well as the file formats are included in the instructions on the TAS site.

Except where expressly provided within the question, all application materials must be submitted in English.

ICANN will not accept application forms or supporting materials submitted through other means than TAS (that is, hard copy, fax, email), unless such submission is in accordance with specific instructions from ICANN to applicants.

1.4.1 Accessing the TLD Application System

The TAS site will be accessible from the New gTLD webpage (http://www.icann.org/en/topics/new-gtld-program.htm), and will be highlighted in communications regarding the opening of the application submission period. Users of TAS will be expected to agree to a standard set of terms of use.
including user rights, obligations, and restrictions in relation to the use of the system.

1.4.1.1 User Registration

TAS user registration (creating a TAS user profile) requires submission of preliminary information, which will be used to validate the identity of the parties involved in the application. An overview of the information collected in the user registration process is below:

<table>
<thead>
<tr>
<th>No.</th>
<th>Questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Full legal name of Applicant</td>
</tr>
<tr>
<td>2</td>
<td>Principal business address</td>
</tr>
<tr>
<td>3</td>
<td>Phone number of Applicant</td>
</tr>
<tr>
<td>4</td>
<td>Fax number of Applicant</td>
</tr>
<tr>
<td>5</td>
<td>Website or URL, if applicable</td>
</tr>
<tr>
<td>6</td>
<td>Primary Contact: Name, Title, Address, Phone, Fax, Email</td>
</tr>
<tr>
<td>7</td>
<td>Secondary Contact: Name, Title, Address, Phone, Fax, Email</td>
</tr>
<tr>
<td>8</td>
<td>Proof of legal establishment</td>
</tr>
<tr>
<td>9</td>
<td>Trading, subsidiary, or joint venture information</td>
</tr>
<tr>
<td>10</td>
<td>Business ID, Tax ID, VAT registration number, or equivalent of Applicant</td>
</tr>
<tr>
<td>11</td>
<td>Applicant background: previous convictions, cybersquatting activities</td>
</tr>
<tr>
<td>12</td>
<td>Deposit payment confirmation and payer information</td>
</tr>
</tbody>
</table>

A subset of identifying information will be collected from the entity performing the user registration, in addition to the applicant information listed above. The registered user could be, for example, an agent, representative, or
employee who would be completing the application on behalf of the applicant.

The registration process will require the user to request the desired number of application slots. For example, a user intending to submit five gTLD applications would complete five application slot requests, and the system would assign the user a unique ID number for each of the five applications.

Users will also be required to submit a deposit of USD 5,000 per application slot. This deposit amount will be credited against the evaluation fee for each application. The deposit requirement is in place to help reduce the risk of frivolous access to the online application system.

After completing the registration, TAS users will receive access enabling them to enter the rest of the application information into the system. Application slots will be populated with the registration information provided by the applicant, which may not ordinarily be changed once slots have been assigned.

No new user registrations will be accepted after 23:59 UTC 29 March 2012.

ICANN will take commercially reasonable steps to protect all applicant data submitted from unauthorized access, but cannot warrant against the malicious acts of third parties who may, through system corruption or other means, gain unauthorized access to such data.

1.4.1.2 Application Form

Having obtained the requested application slots, the applicant will complete the remaining application questions. An overview of the areas and questions contained in the form is shown here:

<table>
<thead>
<tr>

### 1.4.2 Customer Service during the Application Process

Assistance will be available to applicants throughout the application process via the Applicant Service Center (ASC). The ASC will be staffed with customer service agents.
to answer questions relating to the New gTLD Program, the application process, and TAS.

### 1.4.3 Backup Application Process

If the online application system is not available, ICANN will provide alternative instructions for submitting applications.

### 1.5 Fees and Payments

This section describes the fees to be paid by the applicant. Payment instructions are also included here.

#### 1.5.1 gTLD Evaluation Fee

The gTLD evaluation fee is required from all applicants. This fee is in the amount of USD 185,000. The evaluation fee is payable in the form of a 5,000 deposit submitted at the time the user requests an application slot within TAS, and a payment of the remaining 180,000 submitted with the full application. ICANN will not begin its evaluation of an application unless it has received the full gTLD evaluation fee by **23:59 UTC 12 April 2012**.

The gTLD evaluation fee is set to recover costs associated with the new gTLD program. The fee is set to ensure that the program is fully funded and revenue neutral and is not subsidized by existing contributions from ICANN funding sources, including generic TLD registries and registrars, ccTLD contributions and RIR contributions.

The gTLD evaluation fee covers all required reviews in Initial Evaluation and, in most cases, any required reviews in Extended Evaluation. If an extended Registry Services review takes place, an additional fee will be incurred for this review (see section 1.5.2). There is no additional fee to the applicant for Extended Evaluation for geographic names, technical and operational, or financial reviews.

**Refunds** -- In certain cases, refunds of a portion of the evaluation fee may be available for applications that are withdrawn before the evaluation process is complete. An applicant may request a refund at any time until it has executed a registry agreement with ICANN. The amount of the refund will depend on the point in the process at which the withdrawal is requested, as follows:

<table>
<thead>
<tr>
<th>Refund Available to Applicant</th>
<th>Percentage of Evaluation Fee</th>
<th>Amount of Refund</th>
</tr>
</thead>
<tbody>

</table>

Thus, any applicant that has not been successful is eligible for at least a 20% refund of the evaluation fee if it withdraws its application.

An applicant that wishes to withdraw an application must initiate the process through TAS. Withdrawal of an application is final and irrevocable. Refunds will only be issued to the organization that submitted the original payment. All refunds are paid by wire transfer. Any bank transfer or transaction fees incurred by ICANN, or any unpaid evaluation fees, will be deducted from the amount paid. Any refund paid will be in full satisfaction of ICANN’s obligations to the applicant. The applicant will have no entitlement to any additional amounts, including for interest or currency exchange rate changes.

**Note on 2000 proof-of-concept round applicants** --
Participants in ICANN’s proof-of-concept application process in 2000 may be eligible for a credit toward the evaluation fee. The credit is in the amount of USD 86,000 and is subject to:
• submission of documentary proof by the applicant that it is the same entity, a successor in interest to the same entity, or an affiliate of the same entity that applied previously;

• a confirmation that the applicant was not awarded any TLD string pursuant to the 2000 proof-of-concept application round and that the applicant has no legal claims arising from the 2000 proof-of-concept process; and

• submission of an application, which may be modified from the application originally submitted in 2000, for the same TLD string that such entity applied for in the 2000 proof-of-concept application round.

Each participant in the 2000 proof-of-concept application process is eligible for at most one credit. A maximum of one credit may be claimed for any new gTLD application submitted according to the process in this guidebook. Eligibility for this credit is determined by ICANN.

1.5.2 Fees Required in Some Cases

Applicants may be required to pay additional fees in certain cases where specialized process steps are applicable. Those possible additional fees\(^{10}\) include:

- **Registry Services Review Fee** - If applicable, this fee is payable for additional costs incurred in referring an application to the Registry Services Technical Evaluation Panel (RSTEP) for an extended review. Applicants will be notified if such a fee is due. The fee for a three-member RSTEP review team is anticipated to be USD 50,000. In some cases, five-member panels might be required, or there might be increased scrutiny at a greater cost. The amount of the fee will cover the cost of the RSTEP review. In the event that reviews of proposed registry services can be consolidated across multiple applications or applicants, ICANN will apportion the fees in an equitable manner. In every case, the applicant will be advised of the cost before initiation of the review. Refer to subsection 2.2.3 of Module 2 on Registry Services review.

\(^{10}\) The estimated fee amounts provided in this section 1.5.2 will be updated upon engagement of panel service providers and establishment of fees.
- **Dispute Resolution Filing Fee** - This amount must accompany any filing of a formal objection and any response that an applicant files to an objection. This fee is payable directly to the applicable dispute resolution service provider in accordance with the provider's payment instructions. ICANN estimates that filing fees could range from approximately USD 1,000 to USD 5,000 (or more) per party per proceeding. Refer to the appropriate provider for the relevant amount. Refer to Module 3 for dispute resolution procedures.

- **Advance Payment of Costs** - In the event of a formal objection, this amount is payable directly to the applicable dispute resolution service provider in accordance with that provider's procedures and schedule of costs. Ordinarily, both parties in the dispute resolution proceeding will be required to submit an advance payment of costs in an estimated amount to cover the entire cost of the proceeding. This may be either an hourly fee based on the estimated number of hours the panelists will spend on the case (including review of submissions, facilitation of a hearing, if allowed, and preparation of a decision), or a fixed amount. In cases where disputes are consolidated and there are more than two parties involved, the advance payment will occur according to the dispute resolution service provider's rules.

The prevailing party in a dispute resolution proceeding will have its advance payment refunded, while the non-prevailing party will not receive a refund and thus will bear the cost of the proceeding. In cases where disputes are consolidated and there are more than two parties involved, the refund of fees will occur according to the dispute resolution service provider's rules.

ICANN estimates that adjudication fees for a proceeding involving a fixed amount could range from USD 2,000 to USD 8,000 (or more) per proceeding. ICANN further estimates that an hourly rate based proceeding with a one-member panel could range from USD 32,000 to USD 56,000 (or more) and with a three-member panel it could range from USD 70,000 to USD 122,000 (or more). These estimates may be lower if the panel does not call for written submissions beyond the objection and response, and does not allow a hearing. Please
refer to the appropriate provider for the relevant amounts or fee structures.

- **Community Priority Evaluation Fee** - In the event that the applicant participates in a community priority evaluation, this fee is payable as a deposit in an amount to cover the cost of the panel's review of that application (currently estimated at USD 10,000). The deposit is payable to the provider appointed to handle community priority evaluations. Applicants will be notified if such a fee is due. Refer to Section 4.2 of Module 4 for circumstances in which a community priority evaluation may take place. An applicant who scores at or above the threshold for the community priority evaluation will have its deposit refunded.

ICANN will notify the applicants of due dates for payment in respect of additional fees (if applicable). This list does not include fees (annual registry fees) that will be payable to ICANN following execution of a registry agreement.

1.5.3 Payment Methods

Payments to ICANN should be submitted by **wire transfer**. Instructions for making a payment by wire transfer will be available in TAS.\(^\text{11}\)

Payments to Dispute Resolution Service Providers should be submitted in accordance with the provider's instructions.

1.5.4 Requesting a Remittance Form

The TAS interface allows applicants to request issuance of a remittance form for any of the fees payable to ICANN. This service is for the convenience of applicants that require an invoice to process payments.

1.6 Questions about this Applicant Guidebook

For assistance and questions an applicant may have in the process of completing the application form, applicants should use the customer support resources available via the ASC. Applicants who are unsure of the information being sought in a question or the parameters for acceptable documentation are encouraged to communicate these questions through the appropriate

\(^{11}\) Wire transfer is the preferred method of payment as it offers a globally accessible and dependable means for international transfer of funds. This enables ICANN to receive the fee and begin processing applications as quickly as possible.
support channels before the application is submitted. This helps avoid the need for exchanges with evaluators to clarify information, which extends the timeframe associated with processing the application.

Currently, questions may be submitted via <newgtld@icann.org>. To provide all applicants equitable access to information, ICANN will make all questions and answers publicly available.

All requests to ICANN for information about the process or issues surrounding preparation of an application must be submitted to the ASC. ICANN will not grant requests from applicants for personal or telephone consultations regarding the preparation of an application. Applicants that contact ICANN for clarification about aspects of the application will be referred to the ASC.

Answers to inquiries will only provide clarification about the application forms and procedures. ICANN will not provide consulting, financial, or legal advice.
Module 2
Evaluation Procedures

This module describes the evaluation procedures and criteria used to determine whether applied-for gTLDs are approved for delegation. All applicants will undergo an Initial Evaluation and those that do not pass all elements may request Extended Evaluation.

The first, required evaluation is the Initial Evaluation, during which ICANN assesses an applied-for gTLD string, an applicant’s qualifications, and its proposed registry services.

The following assessments are performed in the Initial Evaluation:

- String Reviews
  - String similarity
  - Reserved names
  - DNS stability
  - Geographic names
- Applicant Reviews
  - Demonstration of technical and operational capability
  - Demonstration of financial capability
  - Registry services reviews for DNS stability issues

An application must pass all these reviews to pass the Initial Evaluation. Failure to pass any one of these reviews will result in a failure to pass the Initial Evaluation.

Extended Evaluation may be applicable in cases in which an applicant does not pass the Initial Evaluation. See Section 2.3 below.

2.1 Background Screening

Background screening will be conducted in two areas:

(a) General business diligence and criminal history; and
(b) History of cybersquatting behavior.
The application must pass both background screening areas to be eligible to proceed. Background screening results are evaluated according to the criteria described in section 1.2.1. Due to the potential sensitive nature of the material, applicant background screening reports will not be published.

The following sections describe the process ICANN will use to perform background screening.

2.1.1 General business diligence and criminal history

Applying entities that are publicly traded corporations listed and in good standing on any of the world’s largest 25 stock exchanges (as listed by the World Federation of Exchanges) will be deemed to have passed the general business diligence and criminal history screening. The largest 25 will be based on the domestic market capitalization reported at the end of the most recent calendar year prior to launching each round.¹

Before an entity is listed on an exchange, it must undergo significant due diligence including an investigation by the exchange, regulators, and investment banks. As a publicly listed corporation, an entity is subject to ongoing scrutiny from shareholders, analysts, regulators, and exchanges. All exchanges require monitoring and disclosure of material information about directors, officers, and other key personnel, including criminal behavior. In totality, these requirements meet or exceed the screening ICANN will perform.

For applicants not listed on one of these exchanges, ICANN will submit identifying information for the entity, officers, directors, and major shareholders to an international background screening service. The service provider(s) will use the criteria listed in section 1.2.1 and return results that match these criteria. Only publicly available information will be used in this inquiry.

ICANN is in discussions with INTERPOL to identify ways in which both organizations can collaborate in background screenings of individuals, entities and their identity documents consistent with both organizations’ rules and regulations. Note that the applicant is expected to disclose potential problems in meeting the criteria in the application, and provide any clarification or explanation at the time of application submission. Results returned from

the background screening process will be matched with the disclosures provided by the applicant and those cases will be followed up to resolve issues of discrepancies or potential false positives.

If no hits are returned, the application will generally pass this portion of the background screening.

### 2.1.2 History of cybersquatting

ICANN will screen applicants against UDRP cases and legal databases as financially feasible for data that may indicate a pattern of cybersquatting behavior pursuant to the criteria listed in section 1.2.1.

The applicant is required to make specific declarations regarding these activities in the application. Results returned during the screening process will be matched with the disclosures provided by the applicant and those instances will be followed up to resolve issues of discrepancies or potential false positives.

If no hits are returned, the application will generally pass this portion of the background screening.

### 2.2 Initial Evaluation

The Initial Evaluation consists of two types of review. Each type is composed of several elements.

**String review:** The first review focuses on the applied-for gTLD string to test:

- Whether the applied-for gTLD string is so similar to other strings that it would create a probability of user confusion;
- Whether the applied-for gTLD string might adversely affect DNS security or stability; and
- Whether evidence of requisite government approval is provided in the case of certain geographic names.

**Applicant review:** The second review focuses on the applicant to test:

- Whether the applicant has the requisite technical, operational, and financial capability to operate a registry; and
- Whether the registry services offered by the applicant might adversely affect DNS security or stability.
2.2.1 String Reviews

In the Initial Evaluation, ICANN reviews every applied-for gTLD string. Those reviews are described in greater detail in the following subsections.

2.2.1.1 String Similarity Review

This review involves a preliminary comparison of each applied-for gTLD string against existing TLDs, Reserved Names (see subsection 2.2.1.2), and other applied-for strings. The objective of this review is to prevent user confusion and loss of confidence in the DNS resulting from delegation of many similar strings.

Note: In this Applicant Guidebook, “similar” means strings so similar that they create a probability of user confusion if more than one of the strings is delegated into the root zone.

The visual similarity check that occurs during Initial Evaluation is intended to augment the objection and dispute resolution process (see Module 3, Dispute Resolution Procedures) that addresses all types of similarity.

This similarity review will be conducted by an independent String Similarity Panel.

2.2.1.1.1 Reviews Performed

The String Similarity Panel’s task is to identify visual string similarities that would create a probability of user confusion.

The panel performs this task of assessing similarities that would lead to user confusion in four sets of circumstances, when comparing:

- Applied-for gTLD strings against existing TLDs and reserved names;
- Applied-for gTLD strings against other applied-for gTLD strings;
- Applied-for gTLD strings against strings requested as IDN ccTLDs; and
- Applied-for 2-character IDN gTLD strings against:
  - Every other single character.
  - Any other 2-character ASCII string (to protect possible future ccTLD delegations).
**Similarity to Existing TLDs or Reserved Names** - This review involves cross-checking between each applied-for string and the lists of existing TLD strings and Reserved Names to determine whether two strings are so similar to one another that they create a probability of user confusion.

In the simple case in which an applied-for gTLD string is identical to an existing TLD or reserved name, the online application system will not allow the application to be submitted.

Testing for identical strings also takes into consideration the code point variants listed in any relevant IDN table. For example, protocols treat equivalent labels as alternative forms of the same label, just as “foo” and “Foo” are treated as alternative forms of the same label (RFC 3490).

All TLDs currently in the root zone can be found at [http://iana.org/domains/root/db/](http://iana.org/domains/root/db/).

IDN tables that have been submitted to ICANN are available at [http://www.iana.org/domains/idn-tables/](http://www.iana.org/domains/idn-tables/).

**Similarity to Other Applied-for gTLD Strings (String Contention Sets)** - All applied-for gTLD strings will be reviewed against one another to identify any similar strings. In performing this review, the String Similarity Panel will create contention sets that may be used in later stages of evaluation.

A contention set contains at least two applied-for strings identical or similar to one another. Refer to Module 4, String Contention Procedures, for more information on contention sets and contention resolution.

ICANN will notify applicants who are part of a contention set as soon as the String Similarity review is completed. (This provides a longer period for contending applicants to reach their own resolution before reaching the contention resolution stage.) These contention sets will also be published on ICANN’s website.

**Similarity to TLD strings requested as IDN ccTLDs** -- Applied-for gTLD strings will also be reviewed for similarity to TLD strings requested in the IDN ccTLD Fast Track process (see [http://www.icann.org/en/topics/idn/fast-track/](http://www.icann.org/en/topics/idn/fast-track/)). Should a conflict with a prospective fast-track IDN ccTLD be identified, ICANN will take the following approach to resolving the conflict.
If one of the applications has completed its respective process before the other is lodged, that TLD will be delegated. A gTLD application that has successfully completed all relevant evaluation stages, including dispute resolution and string contention, if applicable, and is eligible for entry into a registry agreement will be considered complete, and therefore would not be disqualified by a newly-filed IDN ccTLD request. Similarly, an IDN ccTLD request that has completed evaluation (i.e., is validated) will be considered complete and therefore would not be disqualified by a newly-filed gTLD application.

In the case where neither application has completed its respective process, where the gTLD application does not have the required approval from the relevant government or public authority, a validated request for an IDN ccTLD will prevail and the gTLD application will not be approved. The term “validated” is defined in the IDN ccTLD Fast Track Process Implementation, which can be found at http://www.icann.org/en/topics/idn.

In the case where a gTLD applicant has obtained the support or non-objection of the relevant government or public authority, but is eliminated due to contention with a string requested in the IDN ccTLD Fast Track process, a full refund of the evaluation fee is available to the applicant if the gTLD application was submitted prior to the publication of the ccTLD request.

**Review of 2-character IDN strings** — In addition to the above reviews, an applied-for gTLD string that is a 2-character IDN string is reviewed by the String Similarity Panel for visual similarity to:

a) Any one-character label (in any script), and

b) Any possible two-character ASCII combination.

An applied-for gTLD string that is found to be too similar to a) or b) above will not pass this review.

**2.2.1.1.2 Review Methodology**

The String Similarity Panel is informed in part by an algorithmic score for the visual similarity between each applied-for string and each of other existing and applied-for TLDs and reserved names. The score will provide one objective measure for consideration by the panel, as part of the process of identifying strings likely to result in user confusion. In general, applicants should expect that a higher visual similarity score suggests a higher probability...
that the application will not pass the String Similarity review. However, it should be noted that the score is only indicative and that the final determination of similarity is entirely up to the Panel’s judgment.

The algorithm, user guidelines, and additional background information are available to applicants for testing and informational purposes. Applicants will have the ability to test their strings and obtain algorithmic results through the application system prior to submission of an application.

The algorithm supports the common characters in Arabic, Chinese, Cyrillic, Devanagari, Greek, Japanese, Korean, and Latin scripts. It can also compare strings in different scripts to each other.

The panel will also take into account variant characters, as defined in any relevant language table, in its determinations. For example, strings that are not visually similar but are determined to be variant TLD strings based on an IDN table would be placed in a contention set. Variant TLD strings that are listed as part of the application will also be subject to the string similarity analysis.

The panel will examine all the algorithm data and perform its own review of similarities between strings and whether they rise to the level of string confusion. In cases of strings in scripts not yet supported by the algorithm, the panel’s assessment process is entirely manual.

The panel will use a common standard to test for whether string confusion exists, as follows:

**Standard for String Confusion** - String confusion exists where a string so nearly resembles another visually that it is likely to deceive or cause confusion. For the likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion.

### 2.2.1.1.3 Outcomes of the String Similarity Review

An application that fails the String Similarity review due to similarity to an existing TLD will not pass the Initial Evaluation,
and no further reviews will be available. Where an application does not pass the String Similarity review, the applicant will be notified as soon as the review is completed.

An application for a string that is found too similar to another applied-for gTLD string will be placed in a contention set.

An application that passes the String Similarity review is still subject to objection by an existing TLD operator or by another gTLD applicant in the current application round. That process requires that a string confusion objection be filed by an objector having the standing to make such an objection. Such category of objection is not limited to visual similarity. Rather, confusion based on any type of similarity (including visual, aural, or similarity of meaning) may be claimed by an objector. Refer to Module 3, Dispute Resolution Procedures, for more information about the objection process.

An applicant may file a formal objection against another gTLD application on string confusion grounds. Such an objection may, if successful, change the configuration of the preliminary contention sets in that the two applied-for gTLD strings will be considered in direct contention with one another (see Module 4, String Contention Procedures). The objection process will not result in removal of an application from a contention set.

2.2.1.2 Reserved Names and Other Unavailable Strings

Certain names are not available as gTLD strings, as detailed in this section.

2.2.1.2.1 Reserved Names

All applied-for gTLD strings are compared with the list of top-level Reserved Names to ensure that the applied-for gTLD string does not appear on that list.

<table>
<thead>
<tr>
<th>Top-Level Reserved Names List</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFRINIC</td>
</tr>
<tr>
<td>ALAC</td>
</tr>
<tr>
<td>APNIC</td>
</tr>
<tr>
<td>ARIN</td>
</tr>
<tr>
<td>ASO</td>
</tr>
<tr>
<td>CCNSO</td>
</tr>
<tr>
<td>EXAMPLE*</td>
</tr>
<tr>
<td>GAC</td>
</tr>
</tbody>
</table>
If an applicant enters a Reserved Name as its applied-for gTLD string, the application system will recognize the Reserved Name and will not allow the application to be submitted.

In addition, applied-for gTLD strings are reviewed during the String Similarity review to determine whether they are similar to a Reserved Name. An application for a gTLD string that is identified as too similar to a Reserved Name will not pass this review.

2.2.1.2.2 Declared Variants

Names appearing on the Declared Variants List (see section 1.3.3) will be posted on ICANN’s website and will be treated essentially the same as Reserved Names, until such time as variant management solutions are developed and variant TLDs are delegated. That is, an application for a gTLD string that is identical or similar to a string on the Declared Variants List will not pass this review.

2.2.1.2.3 Strings Ineligible for Delegation

The following names are prohibited from delegation as gTLDs in the initial application round. Future application rounds may differ according to consideration of further policy advice.

These names are not being placed on the Top-Level Reserved Names List, and thus are not part of the string similarity review conducted for names on that list. Refer to subsection 2.2.1.1: where applied-for gTLD strings are reviewed for similarity to existing TLDs and reserved names, the strings listed in this section are not reserved names and accordingly are not incorporated into this review.

Applications for names appearing on the list included in this section will not be approved.
2.2.1.3 DNS Stability Review

This review determines whether an applied-for gTLD string might cause instability to the DNS. In all cases, this will involve a review for conformance with technical and other requirements for gTLD strings (labels). In some exceptional cases, an extended review may be necessary to investigate possible technical stability problems with the applied-for gTLD string.
Note: All applicants should recognize issues surrounding invalid TLD queries at the root level of the DNS.

Any new TLD registry operator may experience unanticipated queries, and some TLDs may experience a non-trivial load of unanticipated queries. For more information, see the Security and Stability Advisory Committee (SSAC)'s report on this topic at http://www.icann.org/en/committees/security/sac045.pdf. Some publicly available statistics are also available at http://stats.l.root-servers.org/.

ICANN will take steps to alert applicants of the issues raised in SAC045, and encourage the applicant to prepare to minimize the possibility of operational difficulties that would pose a stability or availability problem for its registrants and users. However, this notice is merely an advisory to applicants and is not part of the evaluation, unless the string raises significant security or stability issues as described in the following section.

2.2.1.3.1 DNS Stability: String Review Procedure

New gTLD labels must not adversely affect the security or stability of the DNS. During the Initial Evaluation period, ICANN will conduct a preliminary review on the set of applied-for gTLD strings to:

- ensure that applied-for gTLD strings comply with the requirements provided in section 2.2.1.3.2, and
- determine whether any strings raise significant security or stability issues that may require further review.

There is a very low probability that extended analysis will be necessary for a string that fully complies with the string requirements in subsection 2.2.1.3.2 of this module. However, the string review process provides an additional safeguard if unanticipated security or stability issues arise concerning an applied-for gTLD string.

In such a case, the DNS Stability Panel will perform an extended review of the applied-for gTLD string during the Initial Evaluation period. The panel will determine whether the string fails to comply with relevant standards or creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, and will report on its findings.

If the panel determines that the string complies with relevant standards and does not create the conditions
described above, the application will pass the DNS Stability review.

If the panel determines that the string does not comply with relevant technical standards, or that it creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, the application will not pass the Initial Evaluation, and no further reviews are available. In the case where a string is determined likely to cause security or stability problems in the DNS, the applicant will be notified as soon as the DNS Stability review is completed.

2.2.1.3.2 String Requirements

ICANN will review each applied-for gTLD string to ensure that it complies with the requirements outlined in the following paragraphs.

If an applied-for gTLD string is found to violate any of these rules, the application will not pass the DNS Stability review. No further reviews are available.

Part I -- Technical Requirements for all Labels (Strings) – The technical requirements for top-level domain labels follow.

1.1 The ASCII label (i.e., the label as transmitted on the wire) must be valid as specified in technical standards Domain Names: Implementation and Specification (RFC 1035), and Clarifications to the DNS Specification (RFC 2181) and any updates thereto. This includes the following:

1.1.1 The label must have no more than 63 characters.

1.1.2 Upper and lower case characters are treated as identical.

1.2 The ASCII label must be a valid host name, as specified in the technical standards DOD Internet Host Table Specification (RFC 952), Requirements for Internet Hosts — Application and Support (RFC 1123), and Application Techniques for Checking and Transformation of Names (RFC 3696), Internationalized Domain Names in Applications (IDNA)(RFCs 5890-5894), and any updates thereto. This includes the following:

1.2.1 The ASCII label must consist entirely of letters (alphabetic characters a-z), or
1.2.2 The label must be a valid IDNA A-label (further restricted as described in Part II below).

Part II -- Requirements for Internationalized Domain Names

These requirements apply only to prospective top-level domains that contain non-ASCII characters. Applicants for these internationalized top-level domain labels are expected to be familiar with the Internet Engineering Task Force (IETF) IDNA standards, Unicode standards, and the terminology associated with Internationalized Domain Names.

2.1 The label must be an A-label as defined in IDNA, converted from (and convertible to) a U-label that is consistent with the definition in IDNA, and further restricted by the following, non-exhaustive, list of limitations:

2.1.1 Must be a valid A-label according to IDNA.

2.1.2 The derived property value of all codepoints used in the U-label, as defined by IDNA, must be PVALID or CONTEXT (accompanied by unambiguous contextual rules).\(^4\)

2.1.3 The general category of all codepoints, as defined by IDNA, must be one of (Ll, Lo, Lm, Mn, Mc).

2.1.4 The U-label must be fully compliant with Normalization Form C, as described in Unicode Standard Annex #15: Unicode Normalization Forms. See also examples in [http://unicode.org/faq/normalization.html](http://unicode.org/faq/normalization.html).

2.1.5 The U-label must consist entirely of characters with the same directional property, or fulfill the requirements of the Bidi rule per RFC 5893.

2.2 The label must meet the relevant criteria of the ICANN Guidelines for the Implementation of Internationalised Domain Names. See [http://www.icann.org/en/topics/idn/implementatio](http://www.icann.org/en/topics/idn/implementatio)

---

\(^4\) It is expected that conversion tools for IDNA will be available before the Application Submission period begins, and that labels will be checked for validity under IDNA. In this case, labels valid under the previous version of the protocol (IDNA2003) but not under IDNA will not meet this element of the requirements. Labels that are valid under both versions of the protocol will meet this element of the requirements. Labels valid under IDNA but not under IDNA2003 may meet the requirements; however, applicants are strongly advised to note that the duration of the transition period between the two protocols cannot presently be estimated nor guaranteed in any specific timeframe. The development of support for IDNA in the broader software applications environment will occur gradually. During that time, TLD labels that are valid under IDNA, but not under IDNA2003, will have limited functionality.
n-guidelines.htm. This includes the following, non-exhaustive, list of limitations:

2.2.1 All code points in a single label must be taken from the same script as determined by the Unicode Standard Annex #24: Unicode Script Property (See http://www.unicode.org/reports/tr24/).

2.2.2 Exceptions to 2.2.1 are permissible for languages with established orthographies and conventions that require the commingled use of multiple scripts. However, even with this exception, visually confusable characters from different scripts will not be allowed to co-exist in a single set of permissible code points unless a corresponding policy and character table are clearly defined.

Part III - Policy Requirements for Generic Top-Level Domains – These requirements apply to all prospective top-level domain strings applied for as gTLDs.

3.1 Applied-for gTLD strings in ASCII must be composed of three or more visually distinct characters. Two-character ASCII strings are not permitted, to avoid conflicting with current and future country codes based on the ISO 3166-1 standard.

3.2 Applied-for gTLD strings in IDN scripts must be composed of two or more visually distinct characters in the script, as appropriate. Note, however, that a two-character IDN string will not be approved if:

3.2.1 It is visually similar to any one-character label (in any script); or

3.2.2 It is visually similar to any possible two-character ASCII combination.

See the String Similarity review in subsection 2.2.1.1 for additional information on this requirement.

---

5 Note that the Joint ccNSO-GNSO IDN Working Group (JIG) has made recommendations that this section be revised to allow for single-character IDN gTLD labels. See the JIG Final Report at http://gnso.icann.org/drafts/jig-final-report-30mar11-en.pdf. Implementation models for these recommendations are being developed for community discussion.
2.2.1.4 Geographic Names Review

Applications for gTLD strings must ensure that appropriate consideration is given to the interests of governments or public authorities in geographic names. The requirements and procedure ICANN will follow in the evaluation process are described in the following paragraphs. Applicants should review these requirements even if they do not believe their intended gTLD string is a geographic name. All applied-for gTLD strings will be reviewed according to the requirements in this section, regardless of whether the application indicates it is for a geographic name.

2.2.1.4.1 Treatment of Country or Territory Names

Applications for strings that are country or territory names will not be approved, as they are not available under the New gTLD Program in this application round. A string shall be considered to be a country or territory name if:

i. it is an alpha-3 code listed in the ISO 3166-1 standard.

ii. it is a long-form name listed in the ISO 3166-1 standard, or a translation of the long-form name in any language.

iii. it is a short-form name listed in the ISO 3166-1 standard, or a translation of the short-form name in any language.

iv. it is the short- or long-form name association with a code that has been designated as “exceptionally reserved” by the ISO 3166 Maintenance Agency.

v. it is a separable component of a country name designated on the “Separable Country Names List,” or is a translation of a name appearing on the list, in any language. See the Annex at the end of this module.

vi. it is a permutation or transposition of any of the names included in items (i) through (v). Permutations include removal of spaces, insertion of punctuation, and addition or

---

6 Country and territory names are excluded from the process based on advice from the Governmental Advisory Committee in recent communiqués providing interpretation of Principle 2.2 of the GAC Principles regarding New gTLDs to indicate that strings which are a meaningful representation or abbreviation of a country or territory name should be handled through the forthcoming ccPDP, and other geographic strings could be allowed in the gTLD space if in agreement with the relevant government or public authority.
removal of grammatical articles like “the.” A transposition is considered a change in the sequence of the long or short-form name, for example, “RepublicCzech” or “IslandsCayman.”

vii. it is a name by which a country is commonly known, as demonstrated by evidence that the country is recognized by that name by an intergovernmental or treaty organization.

2.2.1.4.2 Geographic Names Requiring Government Support

The following types of applied-for strings are considered geographic names and must be accompanied by documentation of support or non-objection from the relevant governments or public authorities:

1. An application for any string that is a representation, in any language, of the capital city name of any country or territory listed in the ISO 3166-1 standard.

2. An application for a city name, where the applicant declares that it intends to use the gTLD for purposes associated with the city name.

City names present challenges because city names may also be generic terms or brand names, and in many cases city names are not unique. Unlike other types of geographic names, there are no established lists that can be used as objective references in the evaluation process. Thus, city names are not universally protected. However, the process does provide a means for cities and applicants to work together where desired.

An application for a city name will be subject to the geographic names requirements (i.e., will require documentation of support or non-objection from the relevant governments or public authorities) if:

(a) It is clear from applicant statements within the application that the applicant will use the TLD primarily for purposes associated with the city name; and
(b) The applied-for string is a city name as listed on official city documents.\(^7\)

3. An application for any string that is an exact match of a sub-national place name, such as a county, province, or state, listed in the ISO 3166-2 standard.

4. An application for a string listed as a UNESCO region\(^8\) or appearing on the “Composition of macro geographical (continental) regions, geographical sub-regions, and selected economic and other groupings” list.\(^9\)

In the case of an application for a string appearing on either of the lists above, documentation of support will be required from at least 60% of the respective national governments in the region, and there may be no more than one written statement of objection to the application from relevant governments in the region and/or public authorities associated with the continent or the region.

Where the 60% rule is applied, and there are common regions on both lists, the regional composition contained in the “Composition of macro geographical (continental) regions, geographical sub-regions, and selected economic and other groupings” takes precedence.

An applied-for gTLD string that falls into any of 1 through 4 listed above is considered to represent a geographic name. In the event of any doubt, it is in the applicant’s interest to consult with relevant governments and public authorities and enlist their support or non-objection prior to submission of the application, in order to preclude possible objections and pre-address any ambiguities concerning the string and applicable requirements.

Strings that include but do not match a geographic name (as defined in this section) will not be considered geographic names as defined by section 2.2.1.4.2, and therefore will not require documentation of government support in the evaluation process.

---

\(^7\) City governments with concerns about strings that are duplicates, nicknames or close renderings of a city name should not rely on the evaluation process as the primary means of protecting their interests in a string. Rather, a government may elect to file a formal objection to an application that is opposed by the relevant community, or may submit its own application for the string.

For each application, the Geographic Names Panel will determine which governments are relevant based on the inputs of the applicant, governments, and its own research and analysis. In the event that there is more than one relevant government or public authority for the applied-for gTLD string, the applicant must provide documentation of support or non-objection from all the relevant governments or public authorities. It is anticipated that this may apply to the case of a sub-national place name.

It is the applicant’s responsibility to:

- identify whether its applied-for gTLD string falls into any of the above categories; and
- identify and consult with the relevant governments or public authorities; and
- identify which level of government support is required.

Note: the level of government and which administrative agency is responsible for the filing of letters of support or non-objection is a matter for each national administration to determine. Applicants should consult within the relevant jurisdiction to determine the appropriate level of support.

The requirement to include documentation of support for certain applications does not preclude or exempt applications from being the subject of objections on community grounds (refer to subsection 3.1.1 of Module 3), under which applications may be rejected based on objections showing substantial opposition from the targeted community.

2.2.1.4.3 Documentation Requirements

The documentation of support or non-objection should include a signed letter from the relevant government or public authority. Understanding that this will differ across the respective jurisdictions, the letter could be signed by the minister with the portfolio responsible for domain name administration, ICT, foreign affairs, or the Office of the Prime Minister or President of the relevant jurisdiction; or a senior representative of the agency or department responsible for domain name administration, ICT, foreign affairs, or the Office of the Prime Minister. To assist the applicant in determining who the relevant government or public authority may be for a potential geographic name, the applicant may wish to consult with the relevant
Governmental Advisory Committee (GAC) representative.\(^\text{10}\)

The letter must clearly express the government’s or public authority’s support for or non-objection to the applicant’s application and demonstrate the government’s or public authority’s understanding of the string being requested and its intended use.

The letter should also demonstrate the government’s or public authority’s understanding that the string is being sought through the gTLD application process and that the applicant is willing to accept the conditions under which the string will be available, i.e., entry into a registry agreement with ICANN requiring compliance with consensus policies and payment of fees. (See Module 5 for a discussion of the obligations of a gTLD registry operator.)

A sample letter of support is available as an attachment to this module.

Applicants and governments may conduct discussions concerning government support for an application at any time. Applicants are encouraged to begin such discussions at the earliest possible stage, and enable governments to follow the processes that may be necessary to consider, approve, and generate a letter of support or non-objection.

It is important to note that a government or public authority is under no obligation to provide documentation of support or non-objection in response to a request by an applicant.

It is also possible that a government may withdraw its support for an application at a later time, including after the new gTLD has been delegated, if the registry operator has deviated from the conditions of original support or non-objection. Applicants should be aware that ICANN has committed to governments that, in the event of a dispute between a government (or public authority) and a registry operator that submitted documentation of support from that government or public authority, ICANN will comply with a legally binding order from a court in the jurisdiction of the government or public authority that has given support to an application.

2.2.1.4.4 Review Procedure for Geographic Names

A Geographic Names Panel (GNP) will determine whether each applied-for gTLD string represents a geographic

---

\(^{10}\) See [https://gacweb.icann.org/display/gacweb/GAC+Members](https://gacweb.icann.org/display/gacweb/GAC+Members)
name, and verify the relevance and authenticity of the supporting documentation where necessary.

The GNP will review all applications received, not only those where the applicant has noted its applied-for gTLD string as a geographic name. For any application where the GNP determines that the applied-for gTLD string is a country or territory name (as defined in this module), the application will not pass the Geographic Names review and will be denied. No additional reviews will be available.

For any application where the GNP determines that the applied-for gTLD string is not a geographic name requiring government support (as described in this module), the application will pass the Geographic Names review with no additional steps required.

For any application where the GNP determines that the applied-for gTLD string is a geographic name requiring government support, the GNP will confirm that the applicant has provided the required documentation from the relevant governments or public authorities, and that the communication from the government or public authority is legitimate and contains the required content. ICANN may confirm the authenticity of the communication by consulting with the relevant diplomatic authorities or members of ICANN’s Governmental Advisory Committee for the government or public authority concerned on the competent authority and appropriate point of contact within their administration for communications.

The GNP may communicate with the signing entity of the letter to confirm their intent and their understanding of the terms on which the support for an application is given.

In cases where an applicant has not provided the required documentation, the applicant will be contacted and notified of the requirement, and given a limited time frame to provide the documentation. If the applicant is able to provide the documentation before the close of the Initial Evaluation period, and the documentation is found to meet the requirements, the applicant will pass the Geographic Names review. If not, the applicant will have additional time to obtain the required documentation; however, if the applicant has not produced the required documentation by the required date (at least 90 calendar days from the date of notice), the application will be considered incomplete and will be ineligible for further review. The applicant may reapply in subsequent application rounds, if desired, subject to the fees and requirements of the specific application rounds.
If there is more than one application for a string representing a certain geographic name as described in this section, and the applications have requisite government approvals, the applications will be suspended pending resolution by the applicants. If the applicants have not reached a resolution by either the date of the end of the application round (as announced by ICANN), or the date on which ICANN opens a subsequent application round, whichever comes first, the applications will be rejected and applicable refunds will be available to applicants according to the conditions described in section 1.5.

However, in the event that a contention set is composed of multiple applications with documentation of support from the same government or public authority, the applications will proceed through the contention resolution procedures described in Module 4 when requested by the government or public authority providing the documentation.

If an application for a string representing a geographic name is in a contention set with applications for similar strings that have not been identified as geographical names, the string contention will be resolved using the string contention procedures described in Module 4.

### 2.2.2 Applicant Reviews

Concurrent with the applied-for gTLD string reviews described in subsection 2.2.1, ICANN will review the applicant’s technical and operational capability, its financial capability, and its proposed registry services. Those reviews are described in greater detail in the following subsections.

#### 2.2.2.1 Technical/Operational Review

In its application, the applicant will respond to a set of questions (see questions 24 – 44 in the Application Form) intended to gather information about the applicant’s technical capabilities and its plans for operation of the proposed gTLD.

Applicants are not required to have deployed an actual gTLD registry to pass the Technical/Operational review. It will be necessary, however, for an applicant to demonstrate a clear understanding and accomplishment of some groundwork toward the key technical and operational aspects of a gTLD registry operation. Subsequently, each applicant that passes the technical evaluation and all other steps will be required to complete
a pre-delegation technical test prior to delegation of the new gTLD. Refer to Module 5, Transition to Delegation, for additional information.

2.2.2.2 Financial Review

In its application, the applicant will respond to a set of questions (see questions 45-50 in the Application Form) intended to gather information about the applicant’s financial capabilities for operation of a gTLD registry and its financial planning in preparation for long-term stability of the new gTLD.

Because different registry types and purposes may justify different responses to individual questions, evaluators will pay particular attention to the consistency of an application across all criteria. For example, an applicant’s scaling plans identifying system hardware to ensure its capacity to operate at a particular volume level should be consistent with its financial plans to secure the necessary equipment. That is, the evaluation criteria scale with the applicant’s plans to provide flexibility.

2.2.2.3 Evaluation Methodology

Dedicated technical and financial evaluation panels will conduct the technical/operational and financial reviews, according to the established criteria and scoring mechanism included as an attachment to this module. These reviews are conducted on the basis of the information each applicant makes available to ICANN in its response to the questions in the Application Form.

The evaluators may request clarification or additional information during the Initial Evaluation period. For each application, clarifying questions will be consolidated and sent to the applicant from each of the panels. The applicant will thus have an opportunity to clarify or supplement the application in those areas where a request is made by the evaluators. These communications will occur via TAS. Unless otherwise noted, such communications will include a 2-week deadline for the applicant to respond. Any supplemental information provided by the applicant will become part of the application.

It is the applicant’s responsibility to ensure that the questions have been fully answered and the required documentation is attached. Evaluators are entitled, but not obliged, to request further information or evidence from an applicant, and are not obliged to take into account any information or evidence that is not made
available in the application and submitted by the due date, unless explicitly requested by the evaluators.

2.2.3 **Registry Services Review**

Concurrent with the other reviews that occur during the Initial Evaluation period, ICANN will review the applicant’s proposed registry services for any possible adverse impact on security or stability. The applicant will be required to provide a list of proposed registry services in its application.

2.2.3.1 **Definitions**

*Registry services* are defined as:

1. operations of the registry critical to the following tasks: the receipt of data from registrars concerning registrations of domain names and name servers; provision to registrars of status information relating to the zone servers for the TLD; dissemination of TLD zone files; operation of the registry zone servers; and dissemination of contact and other information concerning domain name server registrations in the TLD as required by the registry agreement;

2. other products or services that the registry operator is required to provide because of the establishment of a consensus policy; and

3. any other products or services that only a registry operator is capable of providing, by reason of its designation as the registry operator.

Proposed registry services will be examined to determine if they might raise significant stability or security issues. Examples of services proposed by existing registries can be found at [http://www.icann.org/en/registries/rsep/](http://www.icann.org/en/registries/rsep/). In most cases, these proposed services successfully pass this inquiry.

Registry services currently provided by gTLD registries can be found in registry agreement appendices. See [http://www.icann.org/en/registries/agreements.htm](http://www.icann.org/en/registries/agreements.htm).

A full definition of registry services can be found at [http://www.icann.org/en/registries/rsep/rsep.html](http://www.icann.org/en/registries/rsep/rsep.html).

For purposes of this review, security and stability are defined as follows:

**Security** – an effect on security by the proposed registry service means (1) the unauthorized disclosure, alteration, insertion or destruction of registry data, or (2) the unauthorized access to or disclosure of information or
resources on the Internet by systems operating in accordance with all applicable standards.

**Stability** - an effect on stability means that the proposed registry service (1) does not comply with applicable relevant standards that are authoritative and published by a well-established, recognized, and authoritative standards body, such as relevant standards-track or best current practice RFCs sponsored by the IETF, or (2) creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, operating in accordance with applicable relevant standards that are authoritative and published by a well-established, recognized and authoritative standards body, such as relevant standards-track or best current practice RFCs and relying on registry operator’s delegation information or provisioning services.

**2.2.3.2 Customary Services**
The following registry services are customary services offered by a registry operator:

- Receipt of data from registrars concerning registration of domain names and name servers
- Dissemination of TLD zone files
- Dissemination of contact or other information concerning domain name registrations (e.g., port-43 WHOIS, Web-based Whois, RESTful Whois)
- DNS Security Extensions

The applicant must describe whether any of these registry services are intended to be offered in a manner unique to the TLD.

Any additional registry services that are unique to the proposed gTLD registry should be described in detail. Directions for describing the registry services are provided at http://www.icann.org/en/registries/rsep/rrs_sample.html.

**2.2.3.3 TLD Zone Contents**
ICANN receives a number of inquiries about use of various record types in a registry zone, as entities contemplate different business and technical models. Permissible zone contents for a TLD zone are:

- Apex SOA record.
- Apex NS records and in-bailiwick glue for the TLD’s DNS servers.
• NS records and in-bailiwick glue for DNS servers of registered names in the TLD.

• DS records for registered names in the TLD.

• Records associated with signing the TLD zone (i.e., RRSIG, DNSKEY, NSEC, and NSEC3).

An applicant wishing to place any other record types into its TLD zone should describe in detail its proposal in the registry services section of the application. This will be evaluated and could result in an extended evaluation to determine whether the service would create a risk of a meaningful adverse impact on security or stability of the DNS. Applicants should be aware that a service based on use of less-common DNS resource records in the TLD zone, even if approved in the registry services review, might not work as intended for all users due to lack of application support.

2.2.3.4 Methodology

Review of the applicant’s proposed registry services will include a preliminary determination of whether any of the proposed registry services could raise significant security or stability issues and require additional consideration.

If the preliminary determination reveals that there may be significant security or stability issues (as defined in subsection 2.2.3.1) surrounding a proposed service, the application will be flagged for an extended review by the Registry Services Technical Evaluation Panel (RSTEP), see http://www.icann.org/en/registries/rsep/rstep.html. This review, if applicable, will occur during the Extended Evaluation period (refer to Section 2.3).

In the event that an application is flagged for extended review of one or more registry services, an additional fee to cover the cost of the extended review will be due from the applicant. Applicants will be advised of any additional fees due, which must be received before the additional review begins.

2.2.4 Applicant’s Withdrawal of an Application

An applicant who does not pass the Initial Evaluation may withdraw its application at this stage and request a partial refund (refer to subsection 1.5 of Module 1).
2.3 *Extended Evaluation*

An applicant may request an Extended Evaluation if the application has failed to pass the Initial Evaluation elements concerning:

- Geographic names (refer to subsection 2.2.1.4). There is no additional fee for an extended evaluation in this instance.

- Demonstration of technical and operational capability (refer to subsection 2.2.2.1). There is no additional fee for an extended evaluation in this instance.

- Demonstration of financial capability (refer to subsection 2.2.2.2). There is no additional fee for an extended evaluation in this instance.

- Registry services (refer to subsection 2.2.3). Note that this investigation incurs an additional fee (the Registry Services Review Fee) if the applicant wishes to proceed. See Section 1.5 of Module 1 for fee and payment information.

An Extended Evaluation does not imply any change of the evaluation criteria. The same criteria used in the Initial Evaluation will be used to review the application in light of clarifications provided by the applicant.

From the time an applicant receives notice of failure to pass the Initial Evaluation, eligible applicants will have 15 calendar days to submit to ICANN the Notice of Request for Extended Evaluation. If the applicant does not explicitly request the Extended Evaluation (and pay an additional fee in the case of a Registry Services inquiry) the application will not proceed.

### 2.3.1 Geographic Names Extended Evaluation

In the case of an application that has been identified as a geographic name requiring government support, but where the applicant has not provided sufficient evidence of support or non-objection from all relevant governments or public authorities by the end of the Initial Evaluation period, the applicant has additional time in the Extended Evaluation period to obtain and submit this documentation.

If the applicant submits the documentation to the Geographic Names Panel by the required date, the GNP will perform its review of the documentation as detailed in
section 2.2.1.4. If the applicant has not provided the
documentation by the required date (at least 90 calendar
days from the date of the notice), the application will not
pass the Extended Evaluation, and no further reviews are
available.

2.3.2 **Technical/Operational or Financial Extended
Evaluation**

The following applies to an Extended Evaluation of an
applicant’s technical and operational capability or
financial capability, as described in subsection 2.2.2.

An applicant who has requested Extended Evaluation will
again access the online application system (TAS) and
clarify its answers to those questions or sections on which it
received a non-passing score (or, in the case of an
application where individual questions were passed but
the total score was insufficient to pass Initial Evaluation,
those questions or sections on which additional points are
possible). The answers should be responsive to the
evaluator report that indicates the reasons for failure, or
provide any amplification that is not a material change to
the application. Applicants may not use the Extended
Evaluation period to substitute portions of new information
for the information submitted in their original applications,
i.e., to materially change the application.

An applicant participating in an Extended Evaluation on
the Technical / Operational or Financial reviews will have
the option to have its application reviewed by the same
evaluation panelists who performed the review during the
Initial Evaluation period, or to have a different set of
panelists perform the review during Extended Evaluation.

The Extended Evaluation allows an additional exchange of
information between the evaluators and the applicant to
further clarify information contained in the application. This
supplemental information will become part of the
application record. Such communications will include a
deadline for the applicant to respond.

ICANN will notify applicants at the end of the Extended
Evaluation period as to whether they have passed. If an
application passes Extended Evaluation, it continues to the
next stage in the process. If an application does not pass
Extended Evaluation, it will proceed no further. No further
reviews are available.
2.3.3 Registry Services Extended Evaluation

This section applies to Extended Evaluation of registry services, as described in subsection 2.2.3.

If a proposed registry service has been referred to the Registry Services Technical Evaluation Panel (RSTEP) for an extended review, the RSTEP will form a review team of members with the appropriate qualifications.

The review team will generally consist of three members, depending on the complexity of the registry service proposed. In a 3-member panel, the review could be conducted within 30 to 45 calendar days. In cases where a 5-member panel is needed, this will be identified before the extended evaluation starts. In a 5-member panel, the review could be conducted in 45 calendar days or fewer.

The cost of an RSTEP review will be covered by the applicant through payment of the Registry Services Review Fee. Refer to payment procedures in section 1.5 of Module 1. The RSTEP review will not commence until payment has been received.

If the RSTEP finds that one or more of the applicant’s proposed registry services may be introduced without risk of a meaningful adverse effect on security or stability, these services will be included in the applicant’s registry agreement with ICANN. If the RSTEP finds that the proposed service would create a risk of a meaningful adverse effect on security or stability, the applicant may elect to proceed with its application without the proposed service, or withdraw its application for the gTLD. In this instance, an applicant has 15 calendar days to notify ICANN of its intent to proceed with the application. If an applicant does not explicitly provide such notice within this time frame, the application will proceed no further.

2.4 Parties Involved in Evaluation

A number of independent experts and groups play a part in performing the various reviews in the evaluation process. A brief description of the various panels, their evaluation roles, and the circumstances under which they work is included in this section.
2.4.1 Panels and Roles

The **String Similarity Panel** will assess whether a proposed gTLD string creates a probability of user confusion due to similarity with any reserved name, any existing TLD, any requested IDN ccTLD, or any new gTLD string applied for in the current application round. This occurs during the String Similarity review in Initial Evaluation. The panel may also review IDN tables submitted by applicants as part of its work.

The **DNS Stability Panel** will determine whether a proposed string might adversely affect the security or stability of the DNS. This occurs during the DNS Stability String review in Initial Evaluation.

The **Geographic Names Panel** will review each application to determine whether the applied-for gTLD represents a geographic name, as defined in this guidebook. In the event that the string is a geographic name requiring government support, the panel will ensure that the required documentation is provided with the application and verify that the documentation is from the relevant governments or public authorities and is authentic.

The **Technical Evaluation Panel** will review the technical components of each application against the criteria in the Applicant Guidebook, along with proposed registry operations, in order to determine whether the applicant is technically and operationally capable of operating a gTLD registry as proposed in the application. This occurs during the Technical/Operational reviews in Initial Evaluation, and may also occur in Extended Evaluation if elected by the applicant.

The **Financial Evaluation Panel** will review each application against the relevant business, financial and organizational criteria contained in the Applicant Guidebook, to determine whether the applicant is financially capable of maintaining a gTLD registry as proposed in the application. This occurs during the Financial review in Initial Evaluation, and may also occur in Extended Evaluation if elected by the applicant.

The **Registry Services Technical Evaluation Panel (RSTEP)** will review proposed registry services in the application to determine if they pose a risk of a meaningful adverse impact on security or stability. This occurs, if applicable, during the Extended Evaluation period.
Members of all panels are required to abide by the established Code of Conduct and Conflict of Interest guidelines included in this module.

2.4.2 Panel Selection Process

ICANN has selected qualified third-party providers to perform the various reviews, based on an extensive selection process. In addition to the specific subject matter expertise required for each panel, specified qualifications are required, including:

- The provider must be able to convene – or have the capacity to convene - globally diverse panels and be able to evaluate applications from all regions of the world, including applications for IDN gTLDs.

- The provider should be familiar with the IETF IDNA standards, Unicode standards, relevant RFCs and the terminology associated with IDNs.

- The provider must be able to scale quickly to meet the demands of the evaluation of an unknown number of applications. At present it is not known how many applications will be received, how complex they will be, and whether they will be predominantly for ASCII or non-ASCII gTLDs.

- The provider must be able to evaluate the applications within the required timeframes of Initial and Extended Evaluation.

2.4.3 Code of Conduct Guidelines for Panelists

The purpose of the New gTLD Program (“Program”) Code of Conduct (“Code”) is to prevent real and apparent conflicts of interest and unethical behavior by any Evaluation Panelist (“Panelist”).

Panelists shall conduct themselves as thoughtful, competent, well prepared, and impartial professionals throughout the application process. Panelists are expected to comply with equity and high ethical standards while assuring the Internet community, its constituents, and the public of objectivity, integrity, confidentiality, and credibility. Unethical actions, or even the appearance of compromise, are not acceptable. Panelists are expected

11 http://newgtlds.icann.org/about/evaluation-panels-selection-process
to be guided by the following principles in carrying out their respective responsibilities. This Code is intended to summarize the principles and nothing in this Code should be considered as limiting duties, obligations or legal requirements with which Panelists must comply.

**Bias** -- Panelists shall:

- not advance personal agendas or non-ICANN approved agendas in the evaluation of applications;

- examine facts as they exist and not be influenced by past reputation, media accounts, or unverified statements about the applications being evaluated;

- exclude themselves from participating in the evaluation of an application if, to their knowledge, there is some predisposing factor that could prejudice them with respect to such evaluation; and

- exclude themselves from evaluation activities if they are philosophically opposed to or are on record as having made generic criticism about a specific type of applicant or application.

**Compensation/Gifts** -- Panelists shall not request or accept any compensation whatsoever or any gifts of substance from the Applicant being reviewed or anyone affiliated with the Applicant. (Gifts of substance would include any gift greater than USD 25 in value).

If the giving of small tokens is important to the Applicant’s culture, Panelists may accept these tokens; however, the total of such tokens must not exceed USD 25 in value. If in doubt, the Panelist should err on the side of caution by declining gifts of any kind.

**Conflicts of Interest** -- Panelists shall act in accordance with the “New gTLD Program Conflicts of Interest Guidelines” (see subsection 2.4.3.1).

**Confidentiality** -- Confidentiality is an integral part of the evaluation process. Panelists must have access to sensitive information in order to conduct evaluations. Panelists must maintain confidentiality of information entrusted to them by ICANN and the Applicant and any other confidential information provided to them from whatever source,
except when disclosure is legally mandated or has been authorized by ICANN. “Confidential information” includes all elements of the Program and information gathered as part of the process – which includes but is not limited to: documents, interviews, discussions, interpretations, and analyses – related to the review of any new gTLD application.

Affirmation -- All Panelists shall read this Code prior to commencing evaluation services and shall certify in writing that they have done so and understand the Code.

2.4.3.1 Conflict of Interest Guidelines for Panelists

It is recognized that third-party providers may have a large number of employees in several countries serving numerous clients. In fact, it is possible that a number of Panelists may be very well known within the registry / registrar community and have provided professional services to a number of potential applicants.

To safeguard against the potential for inappropriate influence and ensure applications are evaluated in an objective and independent manner, ICANN has established detailed Conflict of Interest guidelines and procedures that will be followed by the Evaluation Panelists. To help ensure that the guidelines are appropriately followed ICANN will:

- Require each Evaluation Panelist (provider and individual) to acknowledge and document understanding of the Conflict of Interest guidelines.
- Require each Evaluation Panelist to disclose all business relationships engaged in at any time during the past six months.
- Where possible, identify and secure primary and backup providers for evaluation panels.
- In conjunction with the Evaluation Panelists, develop and implement a process to identify conflicts and re-assign applications as appropriate to secondary or contingent third party providers to perform the reviews.

Compliance Period -- All Evaluation Panelists must comply with the Conflict of Interest guidelines beginning with the opening date of the Application Submission period and ending with the public announcement by ICANN of the
final outcomes of all the applications from the Applicant in question.

Guidelines -- The following guidelines are the minimum standards with which all Evaluation Panelists must comply. It is recognized that it is impossible to foresee and cover all circumstances in which a potential conflict of interest might arise. In these cases the Evaluation Panelist should evaluate whether the existing facts and circumstances would lead a reasonable person to conclude that there is an actual conflict of interest.

Evaluation Panelists and Immediate Family Members:

- Must not be under contract, have or be included in a current proposal to provide Professional Services for or on behalf of the Applicant during the Compliance Period.
- Must not currently hold or be committed to acquire any interest in a privately-held Applicant.
- Must not currently hold or be committed to acquire more than 1% of any publicly listed Applicant's outstanding equity securities or other ownership interests.
- Must not be involved or have an interest in a joint venture, partnership or other business arrangement with the Applicant.
- Must not have been named in a lawsuit with or against the Applicant.
- Must not be a:
  - Director, officer, or employee, or in any capacity equivalent to that of a member of management of the Applicant;
  - Promoter, underwriter, or voting trustee of the Applicant; or
  - Trustee for any pension or profit-sharing trust of the Applicant.

Definitions--

Evaluation Panelist: An Evaluation Panelist is any individual associated with the review of an application. This includes
any primary, secondary, and contingent third party Panelists engaged by ICANN to review new gTLD applications.

Immediate Family Member: Immediate Family Member is a spouse, spousal equivalent, or dependent (whether or not related) of an Evaluation Panelist.

Professional Services: include, but are not limited to legal services, financial audit, financial planning / investment, outsourced services, consulting services such as business / management / internal audit, tax, information technology, registry / registrar services.

2.4.3.2 Code of Conduct Violations

Evaluation panelist breaches of the Code of Conduct, whether intentional or not, shall be reviewed by ICANN, which may make recommendations for corrective action, if deemed necessary. Serious breaches of the Code may be cause for dismissal of the person, persons or provider committing the infraction.

In a case where ICANN determines that a Panelist has failed to comply with the Code of Conduct, the results of that Panelist’s review for all assigned applications will be discarded and the affected applications will undergo a review by new panelists.

Complaints about violations of the Code of Conduct by a Panelist may be brought to the attention of ICANN via the public comment and applicant support mechanisms, throughout the evaluation period. Concerns of applicants regarding panels should be communicated via the defined support channels (see subsection 1.4.2). Concerns of the general public (i.e., non-applicants) can be raised via the public comment forum, as described in Module 1.

2.4.4 Communication Channels

Defined channels for technical support or exchanges of information with ICANN and with evaluation panels are available to applicants during the Initial Evaluation and Extended Evaluation periods. Contacting individual ICANN staff members, Board members, or individuals engaged by ICANN to perform an evaluation role in order to lobby for a particular outcome or to obtain confidential information about applications under review is not appropriate. In the interests of fairness and equivalent treatment for all applicants, any such individual contacts will be referred to the appropriate communication channels.
DRAFT - New gTLD Program – Initial Evaluation and Extended Evaluation

Application is confirmed as complete and ready for evaluation during Administrative Completeness Check

Background Screening
Third-party provider reviews applicant’s background.

Initial Evaluation – String Review

String Similarity
String Similarity Panel reviews applied-for strings to ensure they are not too similar to existing TLDs or Reserved Names.

DNS Stability
All strings reviewed and in extraordinary cases, DNS Stability Panel may perform extended review for possible technical stability issues.

Panel compares all applied-for strings and creates contention sets.

ICANN will seek to publish contention sets prior to publication of full IE results.

Initial Evaluation – Applicant Review

Geographic Names
Geographic Names Panel determines if applied-for string is geographic name requiring government support.

Panel confirms supporting documentation where required.

Technical and Operational Capability
Technical and Operational panel reviews applicant’s answers to questions and supporting documentation.

Financial Capability
Financial panel reviews applicant’s answers to questions and supporting documentation.

Registry Services
Preliminary review of applicant’s registry services and referral to RSTEP for further review during Extended Evaluation where necessary.

Does applicant pass all elements of Initial Evaluation?

Yes

Extended Evaluation process

No

Extended Evaluation can be for any or all of the four elements below:
- Technical and Operational Capability
- Financial Capability
- Geographical Names
- Registry Services

But NOT for String Similarity or DNS Stability

Applicant elects to pursue Extended Evaluation?

Yes

Extended Evaluation process

No

Ineligible for further review

Does applicant pass all elements of Extended Evaluation?

Yes

Applicant continues to subsequent steps

No

Does applicant pass all elements of Extended Evaluation?

No

Ineligible for further review

Yes

No

Does applicant pass all elements of Extended Evaluation?
Annex: Separable Country Names List

gTLD application restrictions on country or territory names are tied to listing in property fields of the ISO 3166-1 standard. Notionally, the ISO 3166-1 standard has an “English short name” field which is the common name for a country and can be used for such protections; however, in some cases this does not represent the common name. This registry seeks to add additional protected elements which are derived from definitions in the ISO 3166-1 standard. An explanation of the various classes is included below.

Separable Country Names List

**Maintenance**

A Separable Country Names Registry will be maintained and published by ICANN Staff.
Each time the ISO 3166-1 standard is updated with a new entry, this registry will be reappraised to identify if the changes to the standard warrant changes to the entries in this registry. Appraisal will be based on the criteria listing in the “Eligibility” section of this document.

Codes reserved by the ISO 3166 Maintenance Agency do not have any implication on this registry, only entries derived from normally assigned codes appearing in ISO 3166-1 are eligible.

If an ISO code is struck off the ISO 3166-1 standard, any entries in this registry deriving from that code must be struck.

Eligibility

Each record in this registry is derived from the following possible properties:

Class A: The ISO 3166-1 English Short Name is comprised of multiple, separable parts whereby the country is comprised of distinct sub-entities. Each of these separable parts is eligible in its own right for consideration as a country name. For example, “Antigua and Barbuda” is comprised of “Antigua” and “Barbuda.”

Class B: The ISO 3166-1 English Short Name (1) or the ISO 3166-1 English Full Name (2) contains additional language as to the type of country the entity is, which is often not used in common usage when referencing the country. For example, one such short name is “The Bolivarian Republic of Venezuela” for a country in common usage referred to as “Venezuela.”

** Macedonia is a separable name in the context of this list; however, due to the ongoing dispute listed in UN documents between the Hellenic Republic (Greece) and the Former Yugoslav Republic of Macedonia over the name, no country will be afforded attribution or rights to the name “Macedonia” until the dispute over the name has been resolved. See [http://daccess-dds-ny.un.org/doc/UNDOC/GEN/N93/240/37/IMG/N9324037.pdf](http://daccess-dds-ny.un.org/doc/UNDOC/GEN/N93/240/37/IMG/N9324037.pdf).

Class C: The ISO 3166-1 Remarks column containing synonyms of the country name, or sub-national entities, as denoted by “often referred to as,” “includes”, “comprises”, “variant” or “principal islands”.

In the first two cases, the registry listing must be directly derivative from the English Short Name by excising words and articles. These registry listings do not include vernacular or other non-official terms used to denote the country.

Eligibility is calculated in class order. For example, if a term can be derived both from Class A and Class C, it is only listed as Class A.
[This letter should be provided on official letterhead]

Marina del Rey, CA 90292

Attention: New gTLD Evaluation Process

Subject: Letter for support for [TLD requested]

This letter is to confirm that [government entity] fully supports the application for [TLD] submitted to ICANN by [applicant] in the New gTLD Program. As the [Minister/Secretary/position] I confirm that I have the authority of the [government/public authority] to be writing to you on this matter. [Explanation of government entity, relevant department, division, office, or agency, and what its functions and responsibilities are]

The gTLD will be used to [explain your understanding of how the name will be used by the applicant. This could include policies developed regarding who can register a name, pricing regime and management structures.] [Government/public authority/department] has worked closely with the applicant in the development of this proposal.

The [government/public authority] supports this application, and in doing so, understands that in the event that the application is successful, [applicant] will be required to enter into a Registry Agreement with ICANN. In doing so, they will be required to pay fees to ICANN and comply with consensus policies developed through the ICANN multi-stakeholder policy processes.

[Government / public authority] further understands that, in the event of a dispute between [government/public authority] and the applicant, ICANN will comply with a legally binding order from a court in the jurisdiction of [government/public authority].

[Optional] This application is being submitted as a community-based application, and as such it is understood that the Registry Agreement will reflect the community restrictions proposed in the application. In the event that we believe the registry is not complying with these restrictions, possible avenues of recourse include the Registry Restrictions Dispute Resolution Procedure.

[Optional] I can advise that in the event that this application is successful [government/public authority] will enter into a separate agreement with the applicant. This agreement will outline the conditions under which we support them in the operation of the TLD, and circumstances under which we would withdraw that support. ICANN will not be a party to this agreement, and enforcement of this agreement lies fully with [government/public authority].
[Government / public authority] understands that the Geographic Names Panel engaged by ICANN will, among other things, conduct due diligence on the authenticity of this documentation. I would request that if additional information is required during this process, that [name and contact details] be contacted in the first instance.

Thank you for the opportunity to support this application.

Yours sincerely

Signature from relevant government/public authority
Since ICANN was founded in 1998 as a not-for-profit, multi-stakeholder organization, one of its key mandates has been to promote competition in the domain name market. ICANN’s mission specifically calls for the corporation to maintain and build on processes that will ensure competition and consumer interests - without compromising Internet security and stability. This includes the consideration and implementation of new gTLDs. It is ICANN’s goal to make the criteria and evaluation as objective as possible.

While new gTLDs are viewed by ICANN as important to fostering choice, innovation and competition in domain registration services, the decision to launch these coming new gTLD application rounds followed a detailed and lengthy consultation process with all constituencies of the global Internet community.

Any public or private sector organization can apply to create and operate a new gTLD. However the process is not like simply registering or buying a second-level domain name. Instead, the application process is to evaluate and select candidates capable of running a registry, a business that manages top level domains such as, for example,.COM or,.INFO. Any successful applicant will need to meet published operational and technical criteria in order to preserve Internet stability and interoperability.

1. Principles of the Technical and Financial New gTLD Evaluation Criteria

- Principles of conservatism. This is the first round of what is to be an ongoing process for the introduction of new TLDs, including Internationalized Domain Names. Therefore, the criteria in this round require applicants to provide a thorough and thoughtful analysis of the technical requirements to operate a registry and the proposed business model.

- The criteria and evaluation should be as objective as possible.
  - With that goal in mind, an important objective of the new TLD process is to diversify the namespace, with different registry business models and target audiences. In some cases, criteria that are objective, but that ignore the differences in business models and target audiences of new registries, will tend to make the process exclusionary. For example, the business model for a registry targeted to a small community need not possess the same robustness in funding and technical infrastructure as a registry intending to compete with large gTLDs. Therefore purely objective criteria such as a requirement for a certain amount of cash on hand will not provide for the flexibility to consider different business models. The process must provide for an objective evaluation framework, but allow for adaptation according to the differing models applicants will present. Within that framework, applicant responses will be evaluated against the criteria in light of the proposed model.

  - Therefore the criteria should be flexible: able to scale with the overall business approach, providing that the planned approach is consistent and coherent, and can withstand highs and lows.
Criteria can be **objective in areas of registrant protection**, for example:

- Providing for funds to continue operations in the event of a registry failure.
- Adherence to data escrow, registry failover, and continuity planning requirements.

The evaluation must strike the correct balance between establishing the business and technical competence of the applicant to operate a registry (to serve the interests of registrants), while not asking for the detailed sort of information or making the judgment that a venture capitalist would. ICANN is not seeking to certify business success but instead seeks to encourage innovation while providing certain safeguards for registrants.

New registries must be added in a way that maintains DNS stability and security. Therefore, ICANN asks several questions so that the applicant can demonstrate an understanding of the technical requirements to operate a registry. ICANN will ask the applicant to demonstrate actual operational technical compliance prior to delegation. This is in line with current prerequisites for the delegation of a TLD.

**Registrant protection** is emphasized in both the criteria and the scoring. Examples of this include asking the applicant to:

- Plan for the occurrence of contingencies and registry failure by putting in place financial resources to fund the ongoing resolution of names while a replacement operator is found or extended notice can be given to registrants.
- Demonstrate a capability to understand and plan for business contingencies to afford some protections through the marketplace.
- Adhere to DNS stability and security requirements as described in the technical section,
- Provide access to the widest variety of services.

**II. Aspects of the Questions Asked in the Application and Evaluation Criteria**

The technical and financial questions are intended to inform and guide the applicant in aspects of registry start-up and operation. The established registry operator should find the questions straightforward while inexperienced applicants should find them a natural part of planning.

Evaluation and scoring (detailed below) will emphasize:

- How thorough are the answers? Are they well thought through and do they provide a sufficient basis for evaluation?

- Demonstration of the ability to operate and fund the registry on an ongoing basis:
  - Funding sources to support technical operations in a manner that ensures stability and security and supports planned expenses,
  - Resilience and sustainability in the face of ups and downs, anticipation of contingencies,
  - Funding to carry on operations in the event of failure.
• Demonstration that the technical plan will likely deliver on best practices for a registry and identification of aspects that might raise DNS stability and security issues.

• Ensures plan integration, consistency and compatibility (responses to questions are not evaluated individually but in comparison to others):
  ▪ Funding adequately covers technical requirements,
  ▪ Funding covers costs,
  ▪ Risks are identified and addressed, in comparison to other aspects of the plan.

III. Scoring

Evaluation

• The questions, criteria, scoring and evaluation methodology are to be conducted in accordance with the principles described earlier in section I. With that in mind, globally diverse evaluation panelists will staff evaluation panels. The diversity of evaluators and access to experts in all regions of the world will ensure application evaluations take into account cultural, technical and business norms in the regions from which applications originate.

• Evaluation teams will consist of two independent panels. One will evaluate the applications against the financial criteria. The other will evaluate the applications against the technical & operational criteria. Given the requirement that technical and financial planning be well integrated, the panels will work together and coordinate information transfer where necessary. Other relevant experts (e.g., technical, audit, legal, insurance, finance) in pertinent regions will provide advice as required.

• Precautions will be taken to ensure that no member of the Evaluation Teams will have any interest or association that may be viewed as a real or potential conflict of interest with an applicant or application. All members must adhere to the Code of Conduct and Conflict of Interest guidelines that are found in Module 2.

• Communications between the evaluation teams and the applicants will be through an online interface. During the evaluation, evaluators may pose a set of clarifying questions to an applicant, to which the applicant may respond through the interface.

Confidentiality: ICANN will post applications after the close of the application submission period. The application form notes which parts of the application will be posted.

Scoring

• Responses will be evaluated against each criterion. A score will be assigned according to the scoring schedule linked to each question or set of questions. In several questions, 1 point is the maximum score that may be awarded. In several other questions, 2 points are awarded for a response that exceeds requirements, 1 point is awarded for a response that meets requirements and 0 points are awarded for a response that fails to meet requirements. Each question must receive at least a score of “1,” making each a “pass/fail” question.

• In the Continuity question in the financial section (see Question #50), up to 3 points are awarded if an applicant provides, at the application stage, a financial instrument that will guarantee ongoing registry operations in the event of a business failure. This extra
point can serve to guarantee passing the financial criteria for applicants who score the minimum passing score for each of the individual criteria. The purpose of this weighting is to reward applicants who make early arrangements for the protection of registrants and to accept relatively riskier business plans where registrants are protected.

- There are 21 Technical & Operational questions. Each question has a criterion and scoring associated with it. The scoring for each is 0, 1, or 2 points as described above. One of the questions (IDN implementation) is optional. Other than the optional questions, all Technical & Operational criteria must be scored a 1 or more or the application will fail the evaluation.

- The total technical score must be equal to or greater than 22 for the application to pass. That means the applicant can pass by:
  - Receiving a 1 on all questions, including the optional question, and a 2 on at least one mandatory question; or
  - Receiving a 1 on all questions, excluding the optional question and a 2 on at least two mandatory questions.

  This scoring methodology requires a minimum passing score for each question and a slightly higher average score than the per question minimum to pass.

- There are six Financial questions and six sets of criteria that are scored by rating the answers to one or more of the questions. For example, the question concerning registry operation costs requires consistency between the technical plans (described in the answers to the Technical & Operational questions) and the costs (described in the answers to the costs question).

- The scoring for each of the Financial criteria is 0, 1 or 2 points as described above with the exception of the Continuity question, for which up to 3 points are possible. All questions must receive at least a 1 or the application will fail the evaluation.

- The total financial score on the six criteria must be 8 or greater for the application to pass. That means the applicant can pass by:
  - Scoring a 3 on the continuity criteria, or
  - Scoring a 2 on any two financial criteria.

- Applications that do not pass Initial Evaluation can enter into an extended evaluation process as described in Module 2. The scoring is the same.

</table>
| Registry Services 23 | Provide name and full description of all the Registry Services to be provided. Descriptions should include both technical and business components of each proposed service, and address any potential security or stability concerns. The following registry services are customary services offered by a registry operator:  
A. Receipt of data from registrars concerning registration of domain names and name servers.  
B. Dissemination of TLD zone files.  
C. Dissemination of contact or other information concerning domain name registrations (e.g., port-43 WHOIS, Web-based Whois, RESTful Whois service).  
D. Internationalized Domain Names, where offered.  
E. DNS Security Extensions (DNSSEC).  
The applicant must describe whether any of these registry services are intended to be offered in a manner unique to the TLD. Additional proposed registry services that are unique to the registry must also be described. | Y | Registry Services are defined as the following: (1) operations of the Registry critical to the following tasks: (i) the receipt of data from registrars concerning registrations of domain names and name servers; (ii) provision to registrars of status information relating to the zone servers for the TLD; (iii) dissemination of TLD zone files; (iv) operation of the Registry zone servers; and (v) dissemination of contact and other information concerning domain name server registrations in the TLD as required by the Registry Agreement; and (2) other products or services that the Registry Operator is required to provide because of the establishment of a Consensus Policy; (3) any other products or services that only a Registry Operator is capable of providing, by reason of its designation as the Registry Operator. A full definition of Registry Services can be found at http://www.icann.org/en/registries/rsep/rsep.html.  
Security: For purposes of this Applicant Guidebook, an effect on security by the proposed Registry Service means (1) the unauthorized disclosure, alteration, insertion or destruction of Registry Data, or (2) the unauthorized access to or disclosure of information or resources on the Internet by systems operating in accordance with applicable standards.  
Stability: For purposes of this Applicant Guidebook, an effect on stability shall mean that the proposed Registry Service (1) is not compliant with applicable relevant standards that are authoritative and published by a well-established, recognized and authoritative standards body, such as relevant Standards-Track or Best Current | Responses are not scored. A preliminary assessment will be made to determine if there are potential security or stability issues with any of the applicant's proposed Registry Services. If any such issues are identified, the application will be referred for an extended review. See the description of the Registry Services review process in Module 2 of the Applicant Guidebook. Any information contained in the application may be considered as part of the Registry Services review. If its application is approved, applicant may engage in only those registry services defined in the application, unless a new request is submitted to ICANN in accordance with the Registry Agreement. |

<td>24</td>
<td><strong>D</strong>emonstration of Technical &amp; Operational Capability (External) <strong>24</strong> Shared Registration System (SRS) Performance: describe</td>
<td>Y</td>
<td>Practice RFCs sponsored by the IETF, or (2) creates a condition that adversely affects the throughput, response time, consistency or coherence of responses to Internet servers or end systems, operating in accordance with applicable relevant standards that are authoritative and published by a well-established, recognized and authoritative standards body, such as relevant Standards-Track or Best Current Practice RFCs and relying on Registry Operator's delegation information or provisioning.</td>
<td>0-1</td>
<td>Complete answer demonstrates: (1) a plan for operating a robust and reliable SRS, one of the five critical registry functions; (2) scalability and performance consistent with the overall business approach, and planned size of the registry; (3) a technical plan that is adequately resourced in the planned costs detailed in the financial section; and (4) evidence of compliance with Specification 6 (section 1.2) to the Registry Agreement.</td>
<td></td>
</tr>
</tbody>
</table>

The questions in this section (24-44) are intended to give applicants an opportunity to demonstrate their technical and operational capabilities to run a registry. In the event that an applicant chooses to outsource one or more parts of its registry operations, the applicant should still provide the full details of the technical arrangements.

Note that the resource plans provided in this section assist in validating the technical and operational plans as well as informing the cost estimates in the Financial section below.

Questions 24-30(a) are designed to provide a description of the applicant's intended technical and operational approach for those registry functions that are outward-facing, i.e., interactions with registrars, registrants, and various DNS users. Responses to these questions will be published to allow review by affected parties.

A complete answer should include, but is not limited to:

- A high-level SRS system description;
- Representative network diagram(s);
- Number of servers;
- Description of interconnectivity with other registry systems;
- Frequency of synchronization between servers; and
- Synchronization scheme (e.g., hot standby, cold standby).

A complete answer is expected to be no more than

0 - fails requirements: Does not meet all the requirements to score 1.
1 - meets requirements: Response includes:
(1) An adequate description of SRS that substantially demonstrates the applicant's capabilities and knowledge required to meet this element;
(2) Details of a well-developed plan to operate a robust and reliable SRS;
(3) SRS plans are sufficient to result in compliance with Specification 6 and Specification 10 to the Registry Agreement;
(4) SRS is consistent with the technical, operational and financial approach described in the application; and
(5) Demonstrates that adequate technical resources are already on hand, or committed or readily available to carry out this function.

27  Registration Life Cycle: provide a detailed description of the proposed registration lifecycle for domain names in the proposed gTLD. The description must:
• explain the various registration states as well as the criteria and procedures that are used to change state;
• describe the typical registration lifecycle of create/update/delete and all intervening steps such as pending, locked, expired, and transferred that may apply;
• clearly explain any time elements that are involved - for instance details of add-grace or redemption grace periods, or notice periods for renewals or transfers; and
• describe resourcing plans for this aspect of the criteria (number and description of personnel roles allocated to this area).

Y  0-1  Complete answer demonstrates:
(1) complete knowledge and understanding of registration lifecycles and states;
(2) consistency with any specific commitments made to registrants as adapted to the overall business approach for the proposed gTLD; and
(3) the ability to comply with relevant RFCs.

1  - meets requirements: Response includes:
(1) An adequate description of the registration lifecycle that substantially demonstrates the applicant's capabilities and knowledge required to meet this element;
(2) Details of a fully developed registration life cycle with definition of various registration states, transition between the states, and trigger points;
(3) A registration lifecycle that is consistent with any commitments to registrants and with technical, operational, and financial plans described in the application; and
(4) Demonstrates an adequate level of resources that are already on hand or committed or readily available to carry out this function.

0  - fails requirements: Does not meet all the requirements to score 1.

A-21
or by registrars via requirements in the Registry-Registrar Agreement (RRA) may include, but are not limited to:
  o Authentication of registrant information as complete and accurate at time of registration. Measures to accomplish this could include performing background checks, verifying all contact information of principals mentioned in registration data, reviewing proof of establishment documentation, and other means.
  o Regular monitoring of registration data for accuracy and completeness, employing authentication methods, and establishing policies and procedures to address domain names with inaccurate or incomplete Whois data; and
  o If relying on registrars to enforce measures, establishing policies and procedures to ensure compliance, which may include audits, financial incentives, penalties, or other means. Note that the requirements of the RAA will continue to apply to all ICANN-accredited registrars.

- A description of policies and procedures that define malicious or abusive behavior, capture metrics, and establish Service Level Requirements for resolution, including service levels for responding to law enforcement requests. This may include rapid takedown or suspension systems and sharing information regarding malicious or abusive behavior with industry partners;
- Adequate controls to ensure proper access to domain functions (can be undertaken by the registry directly or by registrars via requirements in the Registry-Registrar Agreement (RRA)) may include, but are not limited to:
  o Requiring multi-factor authentication (i.e., strong
Rights Protection Mechanisms: Applicants must describe how their registry will comply with policies and practices that minimize abusive registrations and other activities that affect the legal rights of others, such as the Uniform Domain Name Dispute Resolution Policy (UDRP), Uniform Rapid Suspension (URS) system, and Trademark Claims and Sunrise services at startup.

A complete answer should include:

- A description of how the registry operator will implement safeguards against allowing unqualified registrations (e.g., registrations made in violation of the registry’s eligibility restrictions or policies), and reduce opportunities for behaviors such as phishing or pharming. At a minimum, the registry operator must offer a Sunrise period and a Trademark Claims service during the required time periods, and implement decisions rendered under the URS on an ongoing basis; and
- A description of resourcing plans for the initial implementation of, and ongoing maintenance for, this aspect of the criteria (number and description of personnel roles allocated to this area).

To be eligible for a score of 2, answers must also

- Complete answer describes mechanisms designed to:
  - (1) prevent abusive registrations, and
  - (2) identify and address the abusive use of registered names on an ongoing basis.

**0-2**

Complete answer describes mechanisms designed to:

- (1) prevent abusive registrations, and
- (2) identify and address the abusive use of registered names on an ongoing basis.

**2 - exceeds requirements:** Response meets all attributes for a score of 1 and includes:

- (1) Identification of rights protection as a core objective, supported by a well-developed plan for rights protection; and
- (2) Mechanisms for providing effective protections that exceed minimum requirements (e.g., RPMs in addition to those required in the registry agreement).

**1 - meets requirements:** Response includes:

- (1) An adequate description of RPMs that substantially demonstrates the applicant’s capabilities and knowledge required to meet this element;
- (2) A commitment from the applicant to implement of rights protection mechanisms sufficient to comply with minimum requirements in Specification 7;
- (3) Plans that are sufficient to result in compliance with contractual requirements;
- (4) Mechanisms that are consistent with the technical, operational, and financial approach described in the application; and
- (5) Demonstrates an adequate level of resources that are on hand,

### Demonstration of Technical & Operational Capability (Internal)

#### 30 (b) Security Policy: provide the complete security policy and procedures for the proposed registry, including but not limited to:
- system (data, server, application/services) and network access control, ensuring systems are maintained in a secure fashion, including details of how they are monitored, logged and backed up;
- resources to secure integrity of updates between registry systems and nameservers, and between nameservers, if any;
- independent assessment reports demonstrating security capabilities (submitted as attachments), if any;
- provisioning and other measures that mitigate risks posed by denial of service attacks;
- computer and network incident response policies, plans, and processes;
- plans to minimize the risk of unauthorized access to its systems or tampering with registry data;
- intrusion detection mechanisms, a threat analysis for the proposed registry, the defenses that will be deployed against...

| 32 | Architecture: provide documentation for the system and network architecture that will support registry operations for the proposed scale of the registry. System and network architecture documentation must clearly demonstrate the applicant's ability to operate, manage, and monitor registry systems. Documentation should include multiple diagrams or other components including but not limited to:  
- Detailed network diagram(s) showing the full interplay of registry elements, including but not limited to SRS, DNS, Whois, data escrow, and registry database functions;  
- Network and associated systems necessary to support registry operations, including:  
  - Anticipated TCP/IP addressing scheme,  
  - Hardware (i.e., servers, routers, networking components, virtual machines and key characteristics (CPU and RAM, Disk space, internal network connectivity, and make and model)),  
  - Operating system and versions, and  
  - Software and applications (with version information) necessary to support registry operations, management, and monitoring  
- General overview of capacity planning, including bandwidth allocation plans;  
- List of providers/carriers; and  
- Resourcing plans for the initial implementation of, and ongoing maintenance for, this aspect of the criteria (number and description of personnel roles allocated to this area).  
To be eligible for a score of 2, answers must also include evidence of a network architecture design that greatly reduces the risk profile of the proposed registry by providing a level of scalability and adaptability (e.g., protection | N | 0-2 | Complete answer demonstrates:  
(1) detailed and coherent network architecture;  
(2) architecture providing resiliency for registry systems;  
(3) a technical plan scope/scale that is consistent with the overall business approach and planned size of the registry; and  
(4) a technical plan that is adequately resourced in the planned costs detailed in the financial section. | 2 - exceeds requirements: Response meets all attributes for a score of 1 and includes  
(1) Evidence of highly developed and detailed network architecture that is able to scale well above stated projections for high registration volumes, thereby significantly reducing the risk from unexpected volume surges and demonstrates an ability to adapt quickly to support new technologies and services that are not necessarily envisaged for initial registry startup; and  
(2) Evidence of a highly available, robust, and secure infrastructure. | 1 - meets requirements: Response includes  
(1) An adequate description of the architecture that substantially demonstrates the applicant’s capabilities and knowledge required to meet this element;  
(2) Plans for network architecture describe all necessary elements;  
(3) Descriptions demonstrate adequate network architecture providing robustness and security of the registry;  
(4) Bandwidth and SLA are consistent with the technical, operational, and financial approach as described in the application; and  
(5) Demonstrates an adequate level of resources that are on hand, or committed or readily available to carry out this function. | 0 - fails requirements: |
### Question

Database Capabilities: provide details of database capabilities including but not limited to:

- database software;
- storage capacity (both in raw terms [e.g., MB, GB] and in number of registrations / registration transactions);
- maximum transaction throughput (in total and by type of transaction);
- scalability;
- procedures for object creation, editing, and deletion, and user and credential management;
- high availability;
- change management procedures;
- reporting capabilities; and
- resourcing plans for the initial implementation of, and ongoing maintenance for, this aspect of the criteria (number and description of personnel roles allocated to this area).

A registry database data model can be included to provide additional clarity to this response.

Note: Database capabilities described should be in reference to registry services and not necessarily related support functions such as Personnel or Accounting, unless such services are inherently intertwined with the delivery of registry services.

To be eligible for a score of 2, answers must also include evidence of database capabilities that greatly reduce the risk profile of the proposed registry by providing a level of scalability and adaptability that far exceeds the minimum configuration necessary for the expected volume.

A complete answer is expected to be no more than 5 pages.

<td>35</td>
<td>DNS Service: describe the configuration and operation of nameservers, including how the applicant will comply with relevant RFCs. All name servers used for the new gTLD must be operated in compliance with the DNS protocol specifications defined in the relevant RFCs, including but not limited to: 1034, 1035, 1982, 2181, 2182, 2671, 3226, 3596, 3597, 3901, 4343, and 4472. Provide details of the intended DNS Service including, but not limited to: A description of the DNS services to be provided, such as query rates to be supported at initial operation, and reserve capacity of the system. Describe how your nameserver update methods will change at various scales. Describe how DNS performance will change at various scales. RFCs that will be followed – describe how services are compliant with RFCs and if these are dedicated or shared with any other functions (capacity/performance) or DNS zones. The resources used to implement the services - describe complete server hardware and software, including network bandwidth and addressing plans for servers. Also include resourcing plans for the initial implementation of, and ongoing maintenance for, this aspect of the criteria (number and description of personnel roles allocated to this area). Demonstrate how the system will function - describe how the proposed infrastructure will be able to deliver the performance described in Specification 10 (section 2) attached to the Registry Agreement. Examples of evidence include: - Server configuration standard (i.e., planned configuration). - Network addressing and bandwidth for query load and update propagation.</td>
<td>N</td>
<td>Note that the use of DNS wildcard resource records as described in RFC 4592 or any other method or technology for synthesizing DNS resource records or using redirection within the DNS by the registry is prohibited in the Registry Agreement. Also note that name servers for the new gTLD must comply with IANA Technical requirements for authoritative name servers: <a href="http://www.iana.org/procedures/nameserver-requirements.html">http://www.iana.org/procedures/nameserver-requirements.html</a>.</td>
<td>0-1</td>
<td>Complete answer demonstrates: (1) adequate description of configurations of nameservers and compliance with respective DNS protocol-related RFCs; (2) a technical plan scope/scale that is consistent with the overall business approach and planned size of the registry; (3) a technical plan that is adequately resourced in the planned costs detailed in the financial section; (4) evidence of compliance with Specification 6 to the Registry Agreement; and (5) evidence of complete knowledge and understanding of requirements for DNS service, one of the five critical registry functions.</td>
<td>1</td>
<td>meets requirements: Response includes: (1) Adequate description of DNS service that substantially demonstrates the applicant’s capability and knowledge required to meet this element; (2) Plans are sufficient to result in compliance with DNS protocols (Specification 6, section 1.1) and required performance specifications Specification 10, Service Level Matrix; (3) Plans are consistent with technical, operational, and financial approach as described in the application; and (4) Demonstrates an adequate level of resources that are on hand, or committed or readily available to carry out this function. 0 - fails requirements: Does not meet all the requirements to score 1.</td>

<td>OPTIONAL. IDNs:</td>
<td>N</td>
<td>IDNs are an optional service at time of launch. Absence of IDN implementation or plans will not detract from an applicant's score. Applicants who respond to this question with plans for implementation of IDNs at time of launch will be scored according to the criteria indicated here. IDN tables should be submitted in a machine-readable format. The model format described in Section 5 of RFC 4290 would be ideal. The format used by RFC 3743 is an acceptable alternative. Variant generation algorithms that are more complex (such as those with contextual rules) and cannot be expressed using these table formats should be specified in a manner that could be re-implemented programmatically by ICANN. Ideally, for any complex table formats, a reference code implementation should be provided in conjunction with a description of the generation rules.</td>
<td>0-1</td>
<td>IDNs are an optional service. Complete answer demonstrates: (1) complete knowledge and understanding of this aspect of registry technical requirements; (2) a technical plan that is adequately resourced in the planned costs detailed in the financial section; (3) consistency with the commitments made to registrants and the technical, operational, and financial approach described in the application; (4) issues regarding use of scripts are settled and IDN tables are complete and publicly available; and (5) ability to comply with relevant RFCs.</td>
<td>1 - meets requirements for this optional element: Response includes (1) Adequate description of IDN implementation that substantially demonstrates the applicant's capability and knowledge required to meet this element; (2) An adequate description of the IDN procedures, including complete IDN tables, compliance with IDNA/IDN guidelines and RFCs, and periodic monitoring of IDN operations; (3) Evidence of ability to resolve rendering and known IDN issues or spoofing attacks; (4) IDN plans are consistent with the technical, operational, and financial approach as described in the application; and (5) Demonstrates an adequate level of resources that are on hand, committed readily available to carry out this function. 0 - fails requirements: Does not meet all the requirements to score a 1.</td>

</table>
(5) Maintenance of a properly signed zone in accordance with DNSSEC requirements.

Applicants should consider ranges of volume of daily DNS queries (e.g., 0-100M, 100M-1B, 1B+), the incremental costs associated with increasing levels of such queries, and the ability to meet SLA performance metrics.

List the estimated annual cost for each of these functions (specify currency used).

A complete answer is expected to be no more than 10 pages.

(b) Applicants must provide evidence as to how the funds required for performing these critical registry functions will be available and guaranteed to fund registry operations (for the protection of registrants in the new gTLD) for a minimum of three years following the termination of the Registry Agreement. ICANN has identified two methods to fulfill this requirement:

1. Irrevocable standby letter of credit (LOC) issued by a reputable financial institution.
   - The amount of the LOC must be equal to or greater than the amount required to fund the registry operations specified above for at least three years. In the event of a draw upon the letter of credit, the actual payout would be tied to the cost of running those functions.
   - The LOC must name ICANN or its designee as the beneficiary. Any funds paid out would be provided to the designee who is operating the required registry functions.
   - The LOC must have a term of at least five years from the delegation of the TLD. The LOC may be structured with an annual expiration date if it contains an evergreen provision providing for annual extensions, without amendment, for an indefinite number of periods until the issuing bank informs the beneficiary of its final expiration or until the beneficiary releases the LOC as evidenced in writing. If the expiration date

|   | occurs prior to the fifth anniversary of the delegation of the TLD, applicant will be required to obtain a replacement instrument. |                            | • The LOC must be issued by a reputable financial institution insured at the highest level in its jurisdiction. Documentation should indicate by whom the issuing institution is insured (i.e., as opposed to by whom the institution is rated).  
• The LOC will provide that ICANN or its designee shall be unconditionally entitled to a release of funds (full or partial) thereunder upon delivery of written notice by ICANN or its designee.  
• Applicant should attach an original copy of the executed letter of credit or a draft of the letter of credit containing the full terms and conditions. If not yet executed, the Applicant will be required to provide ICANN with an original copy of the executed LOC prior to or concurrent with the execution of the Registry Agreement.  
• The LOC must contain at least the following required elements:  
  o Issuing bank and date of issue.  
  o Beneficiary: ICANN / 4676 Admiralty Way, Suite 330 / Marina del Rey, CA 90292 / US, or its designated.  
  o Applicant's complete name and address.  
  o LOC identifying number.  
  o Exact amount in USD.  
  o Expiry date.  
  o Address, procedure, and required forms whereby presentation for payment is to be made.  
  o Conditions:  
    • Partial drawings from the letter of credit may be made provided that such payment shall reduce the amount under the standby letter of credit.  
    • All payments must be marked with the issuing bank name and the bank's standby letter of credit number.  
    • LOC may not be modified, amended, or amplified by reference to any other document, agreement, or instrument.  
    • The LOC is subject to the International Standby Practices (ISP 98) International Chamber of Commerce (Publication No. 590), or to an alternative standard that has been demonstrated to be reasonably equivalent.  
|   |                                                                           |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |               |          |         |
|   | If an applicant cannot access any such financial institutions, the instrument may be issued by the highest-rated financial institution in the national jurisdiction of the applying entity, if accepted by ICANN.  
Execution by ICANN: For any financial instruments that contemplate ICANN being a party, upon the written request of the applicant, ICANN may (but is not obligated to) execute such agreement prior to submission of the applicant's application if the agreement is on terms acceptable to ICANN. ICANN encourages applicants to deliver a written copy of any such agreement (only if it requires ICANN's signature) to ICANN as soon as possible to facilitate ICANN's review. If the financial instrument requires ICANN's signature, then the applicant will receive 3 points for question 50 (for the instrument being "secured and in place") only if ICANN executes the agreement prior to submission of the application. ICANN will determine, in its sole discretion, whether to execute and become a party to a financial instrument.  
The financial instrument should be submitted in the original language. |               |          |         |
(ii) A deposit into an irrevocable cash escrow account held by a reputable financial institution.  
- The amount of the deposit must be equal to or greater than the amount required to fund registry operations for at least three years.
- Cash is to be held by a third party financial institution which will not allow the funds to be commingled with the Applicant’s operating funds or other funds and may only be accessed by ICANN or its designee if certain conditions are met.
- The account must be held by a reputable financial institution insured at the highest level in its jurisdiction. Documentation should indicate by whom the issuing institution is insured (i.e., as opposed to by whom the institution is rated).
- The escrow agreement relating to the escrow account will provide that ICANN or its designee shall be unconditionally entitled to a release of funds (full or partial) thereunder upon delivery of written notice by ICANN or its designee.
- The escrow agreement must have a term of five years from the delegation of the TLD.
- The funds in the deposit escrow account are not considered to be an asset of ICANN.
- Any interest earnings less bank fees are to accrue to the deposit, and will be paid back to the applicant upon liquidation of the account to the extent not used to pay the costs and expenses of maintaining the escrow.
- The deposit plus accrued interest, less any bank fees in respect of the escrow, is to be returned to the applicant if the funds are not used to fund registry functions due to a triggering event or after five years, whichever is greater.
- The Applicant will be required to provide ICANN an explanation as to the amount of the deposit, the institution that will hold the deposit, and the escrow agreement for the account at the time of submitting an application.
- Applicant should attach evidence of deposited funds in the escrow account, or evidence of provisional arrangement for deposit of funds. Evidence of deposited funds and terms of escrow agreement must be provided to ICANN prior to or concurrent with the execution of the Registry Agreement.
Instructions: TLD Applicant – Financial Projections

The application process requires the applicant to submit two cash basis Financial Projections.

The first projection (Template 1) should show the Financial Projections associated with the Most Likely scenario expected. This projection should include the forecasted registration volume, registration fee, and all costs and capital expenditures expected during the start-up period and during the first three years of operations. Template 1 relates to Question 46 (Projections Template) in the application.

We also ask that applicants show as a separate projection (Template 2) the Financial Projections associated with a realistic Worst Case scenario. Template 2 relates to Question 49 (Contingency Planning) in the application.

For each Projection prepared, please include Comments and Notes on the bottom of the projection (in the area provided) to provide those reviewing these projections with information regarding:

1. Assumptions used, significant variances in Operating Cash Flows and Capital Expenditures from year-to-year;
2. How you plan to fund operations;
3. Contingency planning

As you complete Template 1 and Template 2, please reference data points and/or formulas used in your calculations (where appropriate).

Section I – Projected Cash inflows and outflows

Projected Cash Inflows

Lines A and B. Provide the number of forecasted registrations and the registration fee for years 1, 2, and 3. Leave the Start-up column blank. The start-up period is for cash costs and capital expenditures only; there should be no cash projections input to this column.

Line C. Multiply lines A and B to arrive at the Registration Cash Inflow for line C.

Line D. Provide projected cash inflows from any other revenue source for years 1, 2, and 3. For any figures provided on line D, please disclose the source in the Comments/Notes box of Section I. Note, do not include funding in Line D as that is covered in Section VI.

Line E. Add lines C and D to arrive at the total cash inflow.

Projected Operating Cash Outflows

Start up costs - For all line items (F thru L) Please describe the total period of time this start-up cost is expected to cover in the Comments/Notes box.
**Line F.** Provide the projected labor costs for marketing, customer support, and technical support for start-up, year 1, year 2, and year 3. Note, other labor costs should be put in line L (Other Costs) and specify the type of labor and associated projected costs in the Comments/Notes box of this section.

**Line G.** Marketing Costs represent the amount spent on advertising, promotions, and other marketing activities. This amount should not include labor costs included in Marketing Labor (line F).

**Lines H through K.** Provide projected costs for facilities, G&A, interests and taxes, and Outsourcing for start-up as well as for years 1, 2, and 3. Be sure to list the type of activities that are being outsourced. You may combine certain activities from the same provider as long as an appropriate description of the services being combined is listed in the Comments/Notes box.

**Line L.** Provide any other projected operating costs for start-up, year 1, year 2, year 3. Be sure to specify the type of cost in the Comments/Notes box.

**Line M.** Add lines F through L to arrive at the total costs for line M.

**Line N.** Subtract line E from line M to arrive at the projected net operation number for line N.

**Section IIa – Breakout of Fixed and Variable Operating Cash Outflows**

**Line A.** Provide the projected variable operating cash outflows including labor and other costs that are not fixed in nature. Variable operating cash outflows are expenditures that fluctuate in relationship with increases or decreases in production or level of operations.

**Line B.** Provide the projected fixed operating cash outflows. Fixed operating cash outflows are expenditures that do not generally fluctuate in relationship with increases or decreases in production or level of operations. Such costs are generally necessary to be incurred in order to operate the base line operations of the organization or are expected to be incurred based on contractual commitments.

**Line C – Add lines A and B to arrive at total Fixed and Variable Operating Cash Outflows for line C. This must equal Total Operating Cash Outflows from Section I, Line M.**

**Section IIb – Breakout of Critical Registry Function Operating Cash Outflows**

**Lines A – E.** Provide the projected cash outflows for the five critical registry functions. If these functions are outsourced, the component of the outsourcing fee representing these functions must be separately identified and provided. These costs are based on the applicant’s cost to manage these functions and should be calculated separately from the Continued Operations Instrument (COI) for Question 50.

**Line F.** If there are other critical registry functions based on the applicant’s registry business model then the projected cash outflow for this function must be provided with a description added to the Comment/Notes box. This projected cash outflow may also be included in the 3-year reserve.

**Line G.** Add lines A through F to arrive at the Total Critical Registry Function Cash Outflows.
Section III – Projected Capital Expenditures

**Lines A through C.** Provide projected hardware, software, and furniture & equipment capital expenditures for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.

**Line D.** Provide any projected capital expenditures as a result of outsourcing. This should be included for start-up and years 1, 2, and 3. Specify the type of expenditure and describe the total period of time the start-up cost is expected to cover in the Comments/Notes box of Section III.

**Line E** – Please describe “other” capital expenditures in the Comments/Notes box.

**Line F.** Add lines A through E to arrive at the Total Capital Expenditures.

Section IV – Projected Assets & Liabilities

**Lines A through C.** Provide projected cash, account receivables, and other current assets for start-up as well as for years 1, 2, and 3. For Other Current Assets, specify the type of asset and describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.

**Line D.** Add lines A, B, C to arrive at the Total Current Assets.

**Lines E through G.** Provide projected accounts payable, short-term debt, and other current liabilities for start-up as well as for years 1, 2, and 3. For Other Current Liabilities, specify the type of liability and describe the total period of time the start-up up cost is expected to cover in the Comments/Notes box.

**Line H.** Add lines E through G to arrive at the total current liabilities.

**Lines I through K.** Provide the projected fixed assets (PP&E), the 3-year reserve, and long-term assets for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.

**Line L.** Add lines I through K to arrive at the total long-term assets.

**Line M.** Provide the projected long-term debt for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.

Section V – Projected Cash Flow

Cash flow is driven by **Projected Net Operations** (Section I), **Projected Capital Expenditures** (Section III), and **Projected Assets & Liabilities** (Section IV).

**Line A.** Provide the projected net operating cash flows for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.
**Line B.** Provide the projected capital expenditures for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box of Section V.

**Lines C through F.** Provide the projected change in non-cash current assets, total current liabilities, debt adjustments, and other adjustments for start-up as well as for years 1, 2, and 3. Please describe the total period of time the start-up cost is expected to cover in the Comments/Notes box.

**Line G.** Add lines A through F to arrive at the projected net cash flow for line H.

**Section VI – Sources of Funds**

**Lines A & B.** Provide projected funds from debt and equity at start-up. Describe the sources of debt and equity funding as well as the total period of time the start-up is expected to cover in the Comments/Notes box. Please also provide evidence the funding (e.g., letter of commitment).

**Line C.** Add lines A and B to arrive at the total sources of funds for line C.

**General Comments – Regarding Assumptions Used, Significant Variances Between Years, etc.**

Provide explanations for any significant variances between years (or expected in years beyond the timeframe of the template) in any category of costing or funding.

**General Comments – Regarding how the Applicant Plans to Fund Operations**

Provide general comments explaining how you will fund operations. Funding should be explained in detail in response to question 48.

**General Comments – Regarding Contingencies**

Provide general comments to describe your contingency planning. Contingency planning should be explained in detail in response to question 49.

#### Comments

- Costs for support services have a useful life of 5 years.
- Facilities & other equipment have a useful life of 5 years.
- Debt servicing and tax payments have a useful life of 5 years.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.

### Sources of funds

- Internal Sources: In-house cash reserves
- External Sources: Debt/Equity

### General Comments

- Table is based on budget assumptions that were provided by XYZ Co.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**Debt Adjustments**

- Debt Adjustments are for all debt, both interest and principal.
- They are calculated as the difference between the beginning and ending balances of long-term debt.

**Non-Operating Gains/ (Losses)**

- These are gains or losses from non-operating activities.
- They are calculated as the change in other income and expenses.

**Other Cash Inflows**

- These are cash inflows from sources other than operations.
- They are calculated as other revenues and gains.

**Other Cash Outflows**

- These are cash outflows from sources other than operations.
- They are calculated as other expenses and losses.

---

**Financial Projections:**

- The financial projections are based on budget assumptions provided by XYZ Co.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**Notes:**

- Sources of funds are listed in the Application Form.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**General Comments:**

- The financial projections are based on budget assumptions provided by XYZ Co.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**Comments regarding how the Applicant plans to Fund operations:**

- The Applicant plans to fund operations through a combination of internal cash reserves and external debt.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**General Comments regarding Contingencies:**

- The financial projections are based on budget assumptions provided by XYZ Co.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

---

**Comments regarding contingencies:**

- The Applicant plans to fund operations through a combination of internal cash reserves and external debt.
- The $41k in Start-up Costs represents an offset of the management costs for the first year of operation.
- Subsequent years are based on changes in Current Liabilities.

**Comments regarding how the Applicant plans to fund operations:**

**General Comments regarding contingencies:**
Module 3
Objection Procedures

This module describes two types of mechanisms that may affect an application:

I. The procedure by which ICANN’s Governmental Advisory Committee may provide GAC Advice on New gTLDs to the ICANN Board of Directors concerning a specific application. This module describes the purpose of this procedure, and how GAC Advice on New gTLDs is considered by the ICANN Board once received.

II. The dispute resolution procedure triggered by a formal objection to an application by a third party. This module describes the purpose of the objection and dispute resolution mechanisms, the grounds for lodging a formal objection to a gTLD application, the general procedures for filing or responding to an objection, and the manner in which dispute resolution proceedings are conducted.

This module also discusses the guiding principles, or standards, that each dispute resolution panel will apply in reaching its expert determination.

All applicants should be aware of the possibility that a formal objection may be filed against any application, and of the procedures and options available in the event of such an objection.

3.1 GAC Advice on New gTLDs

ICANN’s Governmental Advisory Committee was formed to consider and provide advice on the activities of ICANN as they relate to concerns of governments, particularly matters where there may be an interaction between ICANN’s policies and various laws and international agreements or where they may affect public policy issues.

The process for GAC Advice on New gTLDs is intended to address applications that are identified by governments to be problematic, e.g., that potentially violate national law or raise sensitivities.

GAC members can raise concerns about any application to the GAC. The GAC as a whole will consider concerns
raised by GAC members, and agree on GAC advice to forward to the ICANN Board of Directors.

The GAC can provide advice on any application. For the Board to be able to consider the GAC advice during the evaluation process, the GAC advice would have to be submitted by the close of the Objection Filing Period (see Module 1).

GAC Advice may take one of the following forms:

I. The GAC advises ICANN that it is the consensus of the GAC that a particular application should not proceed. This will create a strong presumption for the ICANN Board that the application should not be approved. The ICANN Board is also expected to provide a rationale for its decision if it does not follow the GAC Advice.

II. The GAC advises ICANN that there are concerns about a particular application “dot-example.” The ICANN Board is expected to enter into dialogue with the GAC to understand the scope of concerns. The ICANN Board is also expected to provide a rationale for its decision.

III. The GAC advises ICANN that an application should not proceed unless remediated. This will raise a strong presumption for the Board that the application should not proceed unless there is a remediation method available in the Guidebook (such as securing the approval of one or more governments), that is implemented by the applicant. If the issue identified by the GAC is not remediated, the ICANN Board is also expected to provide a rationale for its decision if the Board does not follow GAC advice.

Where GAC Advice on New gTLDs is received by the Board concerning an application, ICANN will publish the Advice and endeavor to notify the relevant applicant(s) promptly. The applicant will have a period of 21 calendar days from the publication date in which to submit a response to the ICANN Board.

ICANN will consider the GAC Advice on New gTLDs as soon as practicable. The Board may consult with independent experts, such as those designated to hear objections in the New gTLD Dispute Resolution Procedure, in cases where the issues raised in the GAC advice are pertinent to one of the subject matter areas of the objection procedures. The receipt of GAC advice will not toll the processing of any
application (i.e., an application will not be suspended but will continue through the stages of the application process).

3.2 Public Objection and Dispute Resolution Process

The independent dispute resolution process is designed to protect certain interests and rights. The process provides a path for formal objections during evaluation of the applications. It allows a party with standing to have its objection considered before a panel of qualified experts.

A formal objection can be filed only on four enumerated grounds, as described in this module. A formal objection initiates a dispute resolution proceeding. In filing an application for a gTLD, the applicant agrees to accept the applicability of this gTLD dispute resolution process. Similarly, an objector accepts the applicability of this gTLD dispute resolution process by filing its objection.

As described in section 3.1 above, ICANN’s Governmental Advisory Committee has a designated process for providing advice to the ICANN Board of Directors on matters affecting public policy issues, and these objection procedures would not be applicable in such a case. The GAC may provide advice on any topic and is not limited to the grounds for objection enumerated in the public objection and dispute resolution process.

3.2.1 Grounds for Objection

A formal objection may be filed on any one of the following four grounds:

String Confusion Objection – The applied-for gTLD string is confusingly similar to an existing TLD or to another applied-for gTLD string in the same round of applications.

Legal Rights Objection – The applied-for gTLD string infringes the existing legal rights of the objector.

Limited Public Interest Objection – The applied-for gTLD string is contrary to generally accepted legal norms of morality and public order that are recognized under principles of international law.

Community Objection – There is substantial opposition to the gTLD application from a significant portion of the community to which the gTLD string may be explicitly or implicitly targeted.
The rationales for these objection grounds are discussed in the final report of the ICANN policy development process for new gTLDs. For more information on this process, see http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm.

### 3.2.2 Standing to Object

Objectors must satisfy standing requirements to have their objections considered. As part of the dispute proceedings, all objections will be reviewed by a panel of experts designated by the applicable Dispute Resolution Service Provider (DRSP) to determine whether the objector has standing to object. Standing requirements for the four objection grounds are:

<table>
<thead>
<tr>
<th>Objection ground</th>
<th>Who may object</th>
</tr>
</thead>
<tbody>
<tr>
<td>String confusion</td>
<td>Existing TLD operator or gTLD applicant in current round. In the case where an IDN ccTLD Fast Track request has been submitted before the public posting of gTLD applications received, and the Fast Track requestor wishes to file a string confusion objection to a gTLD application, the Fast Track requestor will be granted standing.</td>
</tr>
<tr>
<td>Legal rights</td>
<td>Rightsholders</td>
</tr>
<tr>
<td>Limited public interest</td>
<td>No limitations on who may file – however, subject to a “quick look” designed for early conclusion of frivolous and/or abusive objections</td>
</tr>
<tr>
<td>Community</td>
<td>Established institution associated with a clearly delineated community</td>
</tr>
</tbody>
</table>

#### 3.2.2.1 String Confusion Objection

Two types of entities have standing to object:

- An existing TLD operator may file a string confusion objection to assert string confusion between an applied-for gTLD and the TLD that it currently operates.

- Any gTLD applicant in this application round may file a string confusion objection to assert string confusion between an applied-for gTLD and the gTLD for which it has applied, where string confusion between the two applicants has not already been found in the Initial Evaluation. That is, an applicant does not have standing to object to another application with which it is already in a contention set as a result of the Initial Evaluation.

In the case where an existing TLD operator successfully asserts string confusion with an applicant, the application will be rejected.
In the case where a gTLD applicant successfully asserts string confusion with another applicant, the only possible outcome is for both applicants to be placed in a contention set and to be referred to a contention resolution procedure (refer to Module 4, String Contention Procedures). If an objection by one gTLD applicant to another gTLD application is unsuccessful, the applicants may both move forward in the process without being considered in direct contention with one another.

3.2.2.2 Legal Rights Objection

A rightsholder has standing to file a legal rights objection. The source and documentation of the existing legal rights the objector is claiming (which may include either registered or unregistered trademarks) are infringed by the applied-for gTLD must be included in the filing.

An intergovernmental organization (IGO) is eligible to file a legal rights objection if it meets the criteria for registration of a .INT domain name¹:

a) An international treaty between or among national governments must have established the organization; and

b) The organization that is established must be widely considered to have independent international legal personality and must be the subject of and governed by international law.

The specialized agencies of the UN and the organizations having observer status at the UN General Assembly are also recognized as meeting the criteria.

3.2.2.3 Limited Public Interest Objection

Anyone may file a Limited Public Interest Objection. Due to the inclusive standing base, however, objectors are subject to a “quick look” procedure designed to identify and eliminate frivolous and/or abusive objections. An objection found to be manifestly unfounded and/or an abuse of the right to object may be dismissed at any time.

A Limited Public Interest objection would be manifestly unfounded if it did not fall within one of the categories that have been defined as the grounds for such an objection (see subsection 3.5.3).

¹ See also http://www.iana.org/domains/int/policy/.
A Limited Public Interest objection that is manifestly unfounded may also be an abuse of the right to object. An objection may be framed to fall within one of the accepted categories for Limited Public Interest objections, but other facts may clearly show that the objection is abusive. For example, multiple objections filed by the same or related parties against a single applicant may constitute harassment of the applicant, rather than a legitimate defense of legal norms that are recognized under general principles of international law. An objection that attacks the applicant, rather than the applied-for string, could be an abuse of the right to object.²

The quick look is the Panel’s first task, after its appointment by the DRSP and is a review on the merits of the objection. The dismissal of an objection that is manifestly unfounded and/or an abuse of the right to object would be an Expert Determination, rendered in accordance with Article 21 of the New gTLD Dispute Resolution Procedure.

In the case where the quick look review does lead to the dismissal of the objection, the proceedings that normally follow the initial submissions (including payment of the full advance on costs) will not take place, and it is currently contemplated that the filing fee paid by the applicant would be refunded, pursuant to Procedure Article 14(e).

### 3.2.2.4 Community Objection

Established institutions associated with clearly delineated communities are eligible to file a community objection. The community named by the objector must be a community strongly associated with the applied-for gTLD string in the application that is the subject of the objection. To qualify

---

² The jurisprudence of the European Court of Human Rights offers specific examples of how the term “manifestly ill-founded” has been interpreted in disputes relating to human rights. Article 35(3) of the European Convention on Human Rights provides: “The Court shall declare inadmissible any individual application submitted under Article 34 which it considers incompatible with the provisions of the Convention or the protocols thereto, manifestly ill-founded, or an abuse of the right of application.” The ECHR renders reasoned decisions on admissibility, pursuant to Article 35 of the Convention. (Its decisions are published on the Court’s website [http://www.echr.coe.int](http://www.echr.coe.int).) In some cases, the Court briefly states the facts and the law and then announces its decision, without discussion or analysis. E.g., Decision as to the Admissibility of Application No. 34328/96 by Egbert Peree against the Netherlands (1998). In other cases, the Court reviews the facts and the relevant legal rules in detail, providing an analysis to support its conclusion on the admissibility of an application. Examples of such decisions regarding applications alleging violations of Article 10 of the Convention (freedom of expression) include: Décision sur la recevabilité de la requête no 65831/01 présentée par Roger Garaudy contre la France (2003); Décision sur la recevabilité de la requête no 65297/01 présentée par Eduardo Fernando Alves Costa contre le Portugal (2004).

The jurisprudence of the European Court of Human Rights also provides examples of the abuse of the right of application being sanctioned, in accordance with ECHR Article 35(3). See, for example, Décision partielle sur la recevabilité de la requête no 61164/00 présentée par Gérard Duringer et autres contre la France et de la requête no 18589/02 contre la France (2003).
for standing for a community objection, the objector must prove both of the following:

**It is an established institution** – Factors that may be considered in making this determination include, but are not limited to:

- Level of global recognition of the institution;
- Length of time the institution has been in existence; and
- Public historical evidence of its existence, such as the presence of a formal charter or national or international registration, or validation by a government, inter-governmental organization, or treaty. The institution must not have been established solely in conjunction with the gTLD application process.

**It has an ongoing relationship with a clearly delineated community** – Factors that may be considered in making this determination include, but are not limited to:

- The presence of mechanisms for participation in activities, membership, and leadership;
- Institutional purpose related to the benefit of the associated community;
- Performance of regular activities that benefit the associated community; and
- The level of formal boundaries around the community.

The panel will perform a balancing of the factors listed above, as well as other relevant information, in making its determination. It is not expected that an objector must demonstrate satisfaction of each and every factor considered in order to satisfy the standing requirements.

### 3.2.3 Dispute Resolution Service Providers

To trigger a dispute resolution proceeding, an objection must be filed by the posted deadline date, directly with the appropriate DRSP for each objection ground.

- The International Centre for Dispute Resolution has agreed to administer disputes brought pursuant to string confusion objections.
The Arbitration and Mediation Center of the World Intellectual Property Organization has agreed to administer disputes brought pursuant to legal rights objections.

The International Center of Expertise of the International Chamber of Commerce has agreed to administer disputes brought pursuant to Limited Public Interest and Community Objections.

ICANN selected DRSPs on the basis of their relevant experience and expertise, as well as their willingness and ability to administer dispute proceedings in the new gTLD Program. The selection process began with a public call for expressions of interest, followed by dialogue with those candidates who responded. The call for expressions of interest specified several criteria for providers, including established services, subject matter expertise, global capacity, and operational capabilities. An important aspect of the selection process was the ability to recruit panelists who will engender the respect of the parties to the dispute.

### 3.2.4 Options in the Event of Objection

Applicants whose applications are the subject of an objection have the following options:

- The applicant can work to reach a settlement with the objector, resulting in withdrawal of the objection or the application;
- The applicant can file a response to the objection and enter the dispute resolution process (refer to Section 3.2); or
- The applicant can withdraw, in which case the objector will prevail by default and the application will not proceed further.

If for any reason the applicant does not file a response to an objection, the objector will prevail by default.

### 3.2.5 Independent Objector

A formal objection to a gTLD application may also be filed by the Independent Objector (IO). The IO does not act on behalf of any particular persons or entities, but acts solely in the best interests of the public who use the global Internet.

---

In light of this public interest goal, the Independent Objector is limited to filing objections on the grounds of Limited Public Interest and Community.

Neither ICANN staff nor the ICANN Board of Directors has authority to direct or require the IO to file or not file any particular objection. If the IO determines that an objection should be filed, he or she will initiate and prosecute the objection in the public interest.

**Mandate and Scope** - The IO may file objections against “highly objectionable” gTLD applications to which no objection has been filed. The IO is limited to filing two types of objections: (1) Limited Public Interest objections and (2) Community objections. The IO is granted standing to file objections on these enumerated grounds, notwithstanding the regular standing requirements for such objections (see subsection 3.1.2).

The IO may file a Limited Public Interest objection against an application even if a Community objection has been filed, and vice versa.

The IO may file an objection against an application, notwithstanding the fact that a String Confusion objection or a Legal Rights objection was filed.

Absent extraordinary circumstances, the IO is not permitted to file an objection to an application where an objection has already been filed on the same ground.

The IO may consider public comment when making an independent assessment whether an objection is warranted. The IO will have access to application comments received during the comment period.

In light of the public interest goal noted above, the IO shall not object to an application unless at least one comment in opposition to the application is made in the public sphere.

**Selection** - The IO will be selected by ICANN, through an open and transparent process, and retained as an independent consultant. The Independent Objector will be an individual with considerable experience and respect in the Internet community, unaffiliated with any gTLD applicant.

Although recommendations for IO candidates from the community are welcomed, the IO must be and remain independent and unaffiliated with any of the gTLD applicants. The various rules of ethics for judges and
international arbitrators provide models for the IO to declare and maintain his/her independence.

The IO’s (renewable) tenure is limited to the time necessary to carry out his/her duties in connection with a single round of gTLD applications.

**Budget and Funding** - The IO’s budget would comprise two principal elements: (a) salaries and operating expenses, and (b) dispute resolution procedure costs – both of which should be funded from the proceeds of new gTLD applications.

As an objector in dispute resolution proceedings, the IO is required to pay filing and administrative fees, as well as advance payment of costs, just as all other objectors are required to do. Those payments will be refunded by the DRSP in cases where the IO is the prevailing party.

In addition, the IO will incur various expenses in presenting objections before DRSP panels that will not be refunded, regardless of the outcome. These expenses include the fees and expenses of outside counsel (if retained) and the costs of legal research or factual investigations.

### 3.3 Filing Procedures

The information included in this section provides a summary of procedures for filing:

- Objections; and
- Responses to objections.

For a comprehensive statement of filing requirements applicable generally, refer to the New gTLD Dispute Resolution Procedure (“Procedure”) included as an attachment to this module. In the event of any discrepancy between the information presented in this module and the Procedure, the Procedure shall prevail.

Note that the rules and procedures of each DRSP specific to each objection ground must also be followed.

- For a String Confusion Objection, the applicable DRSP Rules are the ICDR Supplementary Procedures for ICANN’s New gTLD Program. These rules are available in draft form and have been posted along with this module.

- For a Legal Rights Objection, the applicable DRSP Rules are the WIPO Rules for New gTLD Dispute
Resolution. These rules are available and have been posted along with this module.

- For a Limited Public Interest Objection, the applicable DRSP Rules are the Rules for Expertise of the International Chamber of Commerce (ICC)\(^4\), as supplemented by the ICC as needed.

- For a Community Objection, the applicable DRSP Rules are the Rules for Expertise of the International Chamber of Commerce (ICC)\(^5\), as supplemented by the ICC as needed.

### 3.3.1 Objection Filing Procedures

The procedures outlined in this subsection must be followed by any party wishing to file a formal objection to an application that has been posted by ICANN. Should an applicant wish to file a formal objection to another gTLD application, it would follow these same procedures.

- All objections must be filed electronically with the appropriate DRSP by the posted deadline date. Objections will not be accepted by the DRSPs after this date.

- All objections must be filed in English.

- Each objection must be filed separately. An objector wishing to object to several applications must file a separate objection and pay the accompanying filing fees for each application that is the subject of an objection. If an objector wishes to object to an application on more than one ground, the objector must file separate objections and pay the accompanying filing fees for each objection ground.

Each objection filed by an objector must include:

- The name and contact information of the objector.

- A statement of the objector's basis for standing; that is, why the objector believes it meets the standing requirements to object.

\(^5\) Ibid.
• A description of the basis for the objection, including:
   A statement giving the specific ground upon which the objection is being filed.
   A detailed explanation of the validity of the objection and why it should be upheld.
• Copies of any documents that the objector considers to be a basis for the objection.

Objections are limited to 5000 words or 20 pages, whichever is less, excluding attachments.

An objector must provide copies of all submissions to the DRSP associated with the objection proceedings to the applicant.

The DRSP will publish, and regularly update a list on its website identifying all objections as they are filed. ICANN will post on its website a notice of all objections filed once the objection filing period has closed.

3.3.2 Objection Filing Fees

At the time an objection is filed, the objector is required to pay a filing fee in the amount set and published by the relevant DRSP. If the filing fee is not paid, the DRSP will dismiss the objection without prejudice. See Section 1.5 of Module 1 regarding fees.

Funding from ICANN for objection filing fees, as well as for advance payment of costs (see subsection 3.4.7 below) is available to the At-Large Advisory Committee (ALAC). Funding for ALAC objection filing and dispute resolution fees is contingent on publication by ALAC of its approved process for considering and making objections. At a minimum, the process for objecting to a gTLD application will require: bottom-up development of potential objections, discussion and approval of objections at the Regional At-Large Organization (RALO) level, and a process for consideration and approval of the objection by the At-Large Advisory Committee.

Funding from ICANN for objection filing fees, as well as for advance payment of costs, is available to individual national governments in the amount of USD 50,000 with the guarantee that a minimum of one objection per government will be fully funded by ICANN where requested. ICANN will develop a procedure for application and disbursement of funds.
Funding available from ICANN is to cover costs payable to the dispute resolution service provider and made directly to the dispute resolution service provider; it does not cover other costs such as fees for legal advice.

3.3.3 Response Filing Procedures

Upon notification that ICANN has published the list of all objections filed (refer to subsection 3.3.1), the DRSPs will notify the parties that responses must be filed within 30 calendar days of receipt of that notice. DRSPs will not accept late responses. Any applicant that fails to respond to an objection within the 30-day response period will be in default, which will result in the objector prevailing.

- All responses must be filed in English.
- Each response must be filed separately. That is, an applicant responding to several objections must file a separate response and pay the accompanying filing fee to respond to each objection.
- Responses must be filed electronically.

Each response filed by an applicant must include:

- The name and contact information of the applicant.
- A point-by-point response to the claims made by the objector.
- Any copies of documents that it considers to be a basis for the response.

Responses are limited to 5000 words or 20 pages, whichever is less, excluding attachments.

Each applicant must provide copies of all submissions to the DRSP associated with the objection proceedings to the objector.

3.3.4 Response Filing Fees

At the time an applicant files its response, it is required to pay a filing fee in the amount set and published by the relevant DRSP, which will be the same as the filing fee paid by the objector. If the filing fee is not paid, the response will be disregarded, which will result in the objector prevailing.

3.4 Objection Processing Overview

The information below provides an overview of the process by which DRSPs administer dispute proceedings that have
been initiated. For comprehensive information, please refer to the New gTLD Dispute Resolution Procedure (included as an attachment to this module).

3.4.1 Administrative Review

Each DRSP will conduct an administrative review of each objection for compliance with all procedural rules within 14 calendar days of receiving the objection. Depending on the number of objections received, the DRSP may ask ICANN for a short extension of this deadline.

If the DRSP finds that the objection complies with procedural rules, the objection will be deemed filed, and the proceedings will continue. If the DRSP finds that the objection does not comply with procedural rules, the DRSP will dismiss the objection and close the proceedings without prejudice to the objector's right to submit a new objection that complies with procedural rules. The DRSP's review or rejection of the objection will not interrupt the time limit for filing an objection.

3.4.2 Consolidation of Objections

Once the DRSP receives and processes all objections, at its discretion the DRSP may elect to consolidate certain objections. The DRSP shall endeavor to decide upon consolidation prior to issuing its notice to applicants that the response should be filed and, where appropriate, shall inform the parties of the consolidation in that notice.

An example of a circumstance in which consolidation might occur is multiple objections to the same application based on the same ground.

In assessing whether to consolidate objections, the DRSP will weigh the efficiencies in time, money, effort, and consistency that may be gained by consolidation against the prejudice or inconvenience consolidation may cause. The DRSPs will endeavor to have all objections resolved on a similar timeline. It is intended that no sequencing of objections will be established.

New gTLD applicants and objectors also will be permitted to propose consolidation of objections, but it will be at the DRSP's discretion whether to agree to the proposal.

ICANN continues to strongly encourage all of the DRSPs to consolidate matters whenever practicable.
3.4.3 Mediation

The parties to a dispute resolution proceeding are encouraged—but not required—to participate in mediation aimed at settling the dispute. Each DRSP has experts who can be retained as mediators to facilitate this process, should the parties elect to do so, and the DRSPs will communicate with the parties concerning this option and any associated fees.

If a mediator is appointed, that person may not serve on the panel constituted to issue an expert determination in the related dispute.

There are no automatic extensions of time associated with the conduct of negotiations or mediation. The parties may submit joint requests for extensions of time to the DRSP according to its procedures, and the DRSP or the panel, if appointed, will decide whether to grant the requests, although extensions will be discouraged. Absent exceptional circumstances, the parties must limit their requests for extension to 30 calendar days.

The parties are free to negotiate without mediation at any time, or to engage a mutually acceptable mediator of their own accord.

3.4.4 Selection of Expert Panels

A panel will consist of appropriately qualified experts appointed to each proceeding by the designated DRSP. Experts must be independent of the parties to a dispute resolution proceeding. Each DRSP will follow its adopted procedures for requiring such independence, including procedures for challenging and replacing an expert for lack of independence.

There will be one expert in proceedings involving a string confusion objection.

There will be one expert, or, if all parties agree, three experts with relevant experience in intellectual property rights disputes in proceedings involving an existing legal rights objection.

There will be three experts recognized as eminent jurists of international reputation, with expertise in relevant fields as appropriate, in proceedings involving a Limited Public Interest objection.

There will be one expert in proceedings involving a community objection.
Neither the experts, the DRSP, ICANN, nor their respective employees, directors, or consultants will be liable to any party in any action for damages or injunctive relief for any act or omission in connection with any proceeding under the dispute resolution procedures.

### 3.4.5 Adjudication

The panel may decide whether the parties shall submit any written statements in addition to the filed objection and response, and may specify time limits for such submissions.

In order to achieve the goal of resolving disputes rapidly and at reasonable cost, procedures for the production of documents shall be limited. In exceptional cases, the panel may require a party to produce additional evidence.

Disputes will usually be resolved without an in-person hearing. The panel may decide to hold such a hearing only in extraordinary circumstances.

### 3.4.6 Expert Determination

The DRSPs’ final expert determinations will be in writing and will include:

- A summary of the dispute and findings;
- An identification of the prevailing party; and
- The reasoning upon which the expert determination is based.

Unless the panel decides otherwise, each DRSP will publish all decisions rendered by its panels in full on its website.

The findings of the panel will be considered an expert determination and advice that ICANN will accept within the dispute resolution process.

### 3.4.7 Dispute Resolution Costs

Before acceptance of objections, each DRSP will publish a schedule of costs or statement of how costs will be calculated for the proceedings that it administers under this procedure. These costs cover the fees and expenses of the members of the panel and the DRSP’s administrative costs.

ICANN expects that string confusion and legal rights objection proceedings will involve a fixed amount charged by the panelists while Limited Public Interest and
community objection proceedings will involve hourly rates charged by the panelists.

Within ten (10) calendar days of constituting the panel, the DRSP will estimate the total costs and request advance payment in full of its costs from both the objector and the applicant. Each party must make its advance payment within ten (10) calendar days of receiving the DRSP’s request for payment and submit to the DRSP evidence of such payment. The respective filing fees paid by the parties will be credited against the amounts due for this advance payment of costs.

The DRSP may revise its estimate of the total costs and request additional advance payments from the parties during the resolution proceedings.

Additional fees may be required in specific circumstances; for example, if the DRSP receives supplemental submissions or elects to hold a hearing.

If an objector fails to pay these costs in advance, the DRSP will dismiss its objection and no fees paid by the objector will be refunded.

If an applicant fails to pay these costs in advance, the DRSP will sustain the objection and no fees paid by the applicant will be refunded.

After the hearing has taken place and the panel renders its expert determination, the DRSP will refund the advance payment of costs to the prevailing party.

3.5 Dispute Resolution Principles (Standards)

Each panel will use appropriate general principles (standards) to evaluate the merits of each objection. The principles for adjudication on each type of objection are specified in the paragraphs that follow. The panel may also refer to other relevant rules of international law in connection with the standards.

The objector bears the burden of proof in each case.

The principles outlined below are subject to evolution based on ongoing consultation with DRSPs, legal experts, and the public.
3.5.1 String Confusion Objection

A DRSP panel hearing a string confusion objection will consider whether the applied-for gTLD string is likely to result in string confusion. String confusion exists where a string so nearly resembles another that it is likely to deceive or cause confusion. For a likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion.

3.5.2 Legal Rights Objection

In interpreting and giving meaning to GNSO Recommendation 3 ("Strings must not infringe the existing legal rights of others that are recognized or enforceable under generally accepted and internationally recognized principles of law"), a DRSP panel of experts presiding over a legal rights objection will determine whether the potential use of the applied-for gTLD by the applicant takes unfair advantage of the distinctive character or the reputation of the objector's registered or unregistered trademark or service mark ("mark") or IGO name or acronym (as identified in the treaty establishing the organization), or unjustifiably impairs the distinctive character or the reputation of the objector's mark or IGO name or acronym, or otherwise creates an impermissible likelihood of confusion between the applied-for gTLD and the objector's mark or IGO name or acronym.

In the case where the objection is based on trademark rights, the panel will consider the following non-exclusive factors:

1. Whether the applied-for gTLD is identical or similar, including in appearance, phonetic sound, or meaning, to the objector's existing mark.
2. Whether the objector's acquisition and use of rights in the mark has been bona fide.
3. Whether and to what extent there is recognition in the relevant sector of the public of the sign corresponding to the gTLD, as the mark of the objector, of the applicant or of a third party.
4. Applicant's intent in applying for the gTLD, including whether the applicant, at the time of application for the gTLD, had knowledge of the objector's mark, or could not have reasonably been unaware of that mark, and including whether the applicant has
engaged in a pattern of conduct whereby it applied for or operates TLDs or registrations in TLDs which are identical or confusingly similar to the marks of others.

5. Whether and to what extent the applicant has used, or has made demonstrable preparations to use, the sign corresponding to the gTLD in connection with a bona fide offering of goods or services or a bona fide provision of information in a way that does not interfere with the legitimate exercise by the objector of its mark rights.

6. Whether the applicant has marks or other intellectual property rights in the sign corresponding to the gTLD, and, if so, whether any acquisition of such a right in the sign, and use of the sign, has been bona fide, and whether the purported or likely use of the gTLD by the applicant is consistent with such acquisition or use.

7. Whether and to what extent the applicant has been commonly known by the sign corresponding to the gTLD, and if so, whether any purported or likely use of the gTLD by the applicant is consistent therewith and bona fide.

8. Whether the applicant’s intended use of the gTLD would create a likelihood of confusion with the objector’s mark as to the source, sponsorship, affiliation, or endorsement of the gTLD.

In the case where a legal rights objection has been filed by an IGO, the panel will consider the following non-exclusive factors:

1. Whether the applied-for gTLD is identical or similar, including in appearance, phonetic sound or meaning, to the name or acronym of the objecting IGO;

2. Historical coexistence of the IGO and the applicant’s use of a similar name or acronym. Factors considered may include:
   a. Level of global recognition of both entities;
   b. Length of time the entities have been in existence;
   c. Public historical evidence of their existence, which may include whether the objecting IGO has communicated its name or abbreviation under Article 6ter of the Paris Convention for the Protection of Industrial Property.
3. Whether and to what extent the applicant has used, or has made demonstrable preparations to use, the sign corresponding to the TLD in connection with a bona fide offering of goods or services or a bona fide provision of information in a way that does not interfere with the legitimate exercise of the objecting IGO’s name or acronym;

4. Whether and to what extent the applicant has been commonly known by the sign corresponding to the applied-for gTLD, and if so, whether any purported or likely use of the gTLD by the applicant is consistent therewith and bona fide; and

5. Whether the applicant’s intended use of the applied-for gTLD would create a likelihood of confusion with the objecting IGO’s name or acronym as to the source, sponsorship, affiliation, or endorsement of the TLD.

3.5.3 Limited Public Interest Objection

An expert panel hearing a Limited Public Interest objection will consider whether the applied-for gTLD string is contrary to general principles of international law for morality and public order.

Examples of instruments containing such general principles include:

- The Universal Declaration of Human Rights (UDHR)
- The International Covenant on Civil and Political Rights (ICCPR)
- The Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW)
- The International Convention on the Elimination of All Forms of Racial Discrimination
- Declaration on the Elimination of Violence against Women
- The International Covenant on Economic, Social, and Cultural Rights
- The Convention against Torture and Other Cruel, Inhuman, or Degrading Treatment or Punishment
- The International Convention on the Protection of the Rights of all Migrant Workers and Members of their Families
- Slavery Convention
- Convention on the Prevention and Punishment of the Crime of Genocide
- Convention on the Rights of the Child

Note that these are included to serve as examples, rather than an exhaustive list. It should be noted that these instruments vary in their ratification status. Additionally, states may limit the scope of certain provisions through reservations and declarations indicating how they will interpret and apply certain provisions. National laws not based on principles of international law are not a valid ground for a Limited Public Interest objection.

Under these principles, everyone has the right to freedom of expression, but the exercise of this right carries with it special duties and responsibilities. Accordingly, certain limited restrictions may apply.

The grounds upon which an applied-for gTLD string may be considered contrary to generally accepted legal norms relating to morality and public order that are recognized under principles of international law are:

- Incitement to or promotion of violent lawless action;
- Incitement to or promotion of discrimination based upon race, color, gender, ethnicity, religion or national origin, or other similar types of discrimination that violate generally accepted legal norms recognized under principles of international law;
- Incitement to or promotion of child pornography or other sexual abuse of children; or
- A determination that an applied-for gTLD string would be contrary to specific principles of international law as reflected in relevant international instruments of law.

The panel will conduct its analysis on the basis of the applied-for gTLD string itself. The panel may, if needed, use as additional context the intended purpose of the TLD as stated in the application.

3.5.4 Community Objection

The four tests described here will enable a DRSP panel to determine whether there is substantial opposition from a
significant portion of the community to which the string may be targeted. For an objection to be successful, the objector must prove that:

- The community invoked by the objector is a clearly delineated community; and
- Community opposition to the application is substantial; and
- There is a strong association between the community invoked and the applied-for gTLD string; and
- The application creates a likelihood of material detriment to the rights or legitimate interests of a significant portion of the community to which the string may be explicitly or implicitly targeted. Each of these tests is described in further detail below.

**Community** – The objector must prove that the community expressing opposition can be regarded as a clearly delineated community. A panel could balance a number of factors to determine this, including but not limited to:

- The level of public recognition of the group as a community at a local and/or global level;
- The level of formal boundaries around the community and what persons or entities are considered to form the community;
- The length of time the community has been in existence;
- The global distribution of the community (this may not apply if the community is territorial); and
- The number of people or entities that make up the community.

If opposition by a number of people/entities is found, but the group represented by the objector is not determined to be a clearly delineated community, the objection will fail.

**Substantial Opposition** – The objector must prove substantial opposition within the community it has identified itself as representing. A panel could balance a number of factors to determine whether there is substantial opposition, including but not limited to:

- Number of expressions of opposition relative to the composition of the community;
• The representative nature of entities expressing opposition;
• Level of recognized stature or weight among sources of opposition;
• Distribution or diversity among sources of expressions of opposition, including:
  • Regional
  • Subsectors of community
  • Leadership of community
  • Membership of community
• Historical defense of the community in other contexts; and
• Costs incurred by objector in expressing opposition, including other channels the objector may have used to convey opposition.

If some opposition within the community is determined, but it does not meet the standard of substantial opposition, the objection will fail.

**Targeting** – The objector must prove a strong association between the applied-for gTLD string and the community represented by the objector. Factors that could be balanced by a panel to determine this include but are not limited to:

• Statements contained in application;
• Other public statements by the applicant;
• Associations by the public.

If opposition by a community is determined, but there is no strong association between the community and the applied-for gTLD string, the objection will fail.

**Detriment** – The objector must prove that the application creates a likelihood of material detriment to the rights or legitimate interests of a significant portion of the community to which the string may be explicitly or implicitly targeted. An allegation of detriment that consists only of the applicant being delegated the string instead of the objector will not be sufficient for a finding of material detriment.
Factors that could be used by a panel in making this determination include but are not limited to:

- Nature and extent of damage to the reputation of the community represented by the objector that would result from the applicant’s operation of the applied-for gTLD string;
- Evidence that the applicant is not acting or does not intend to act in accordance with the interests of the community or of users more widely, including evidence that the applicant has not proposed or does not intend to institute effective security protection for user interests;
- Interference with the core activities of the community that would result from the applicant’s operation of the applied-for gTLD string;
- Dependence of the community represented by the objector on the DNS for its core activities;
- Nature and extent of concrete or economic damage to the community represented by the objector that would result from the applicant’s operation of the applied-for gTLD string; and
- Level of certainty that alleged detrimental outcomes would occur.

If opposition by a community is determined, but there is no likelihood of material detriment to the targeted community resulting from the applicant’s operation of the applied-for gTLD, the objection will fail.

The objector must meet all four tests in the standard for the objection to prevail.
DRAFT - New gTLD Program – Objection and Dispute Resolution

Party with standing files objection directly with Dispute Resolution Service Provider (DRSP) for these grounds:
- String Confusion
- Legal Rights
- Limited Public Interest; and/or
- Community
Objector pays filing fee directly to DRSP

Objection filing period opens

No – 7 Days to Correct

Objection filed with correct DRSP?

Advance payment of costs due

45 Days

Expert Determination

DRSP and ICANN update respective websites to reflect determination

 Applicant withdraws

Does applicant clear all objections?

Yes

Applicant proceeds to subsequent stage

No
These Procedures were designed with an eye toward timely and efficient dispute resolution. As part of the New gTLD Program, these Procedures apply to all proceedings administered by each of the dispute resolution service providers (DRSP). Each of the DRSPs has a specific set of rules that will also apply to such proceedings.
NEW gTLD DISPUTE RESOLUTION PROCEDURE

Article 1. ICANN’s New gTLD Program

(a) The Internet Corporation for Assigned Names and Numbers (“ICANN”) has implemented a program for the introduction of new generic Top-Level Domain Names (“gTLDs”) in the internet. There will be a succession of rounds, during which applicants may apply for new gTLDs, in accordance with terms and conditions set by ICANN.

(b) The new gTLD program includes a dispute resolution procedure, pursuant to which disputes between a person or entity who applies for a new gTLD and a person or entity who objects to that gTLD are resolved in accordance with this New gTLD Dispute Resolution Procedure (the “Procedure”).

(c) Dispute resolution proceedings shall be administered by a Dispute Resolution Service Provider (“DRSP”) in accordance with this Procedure and the applicable DRSP Rules that are identified in Article 4(b).

(d) By applying for a new gTLD, an applicant accepts the applicability of this Procedure and the applicable DRSP’s Rules that are identified in Article 4(b); by filing an objection to a new gTLD, an objector accepts the applicability of this Procedure and the applicable DRSP’s Rules that are identified in Article 4(b). The parties cannot derogate from this Procedure without the express approval of ICANN and from the applicable DRSP Rules without the express approval of the relevant DRSP.

Article 2. Definitions

(a) The “Applicant” or “Respondent” is an entity that has applied to ICANN for a new gTLD and that will be the party responding to the Objection.

(b) The “Objector” is one or more persons or entities who have filed an objection against a new gTLD for which an application has been submitted.

(c) The “Panel” is the panel of Experts, comprising one or three “Experts,” that has been constituted by a DRSP in accordance with this Procedure and the applicable DRSP Rules that are identified in Article 4(b).

(d) The “Expert Determination” is the decision upon the merits of the Objection that is rendered by a Panel in a proceeding conducted under this Procedure and the applicable DRSP Rules that are identified in Article 4(b).

(e) The grounds upon which an objection to a new gTLD may be filed are set out in full in Module 3 of the Applicant Guidebook. Such grounds are identified in this Procedure, and are based upon the Final Report on the Introduction of New Generic Top-Level Domains, dated 7 August 2007, issued by the ICANN Generic Names Supporting Organization (GNSO), as follows:

(i) “String Confusion Objection” refers to the objection that the string comprising the potential gTLD is confusingly similar to an existing top-level domain or another string applied for in the same round of applications.

(ii) “Existing Legal Rights Objection” refers to the objection that the string comprising the potential new gTLD infringes the existing legal rights of others.
that are recognized or enforceable under generally accepted and internationally recognized principles of law.

(iii) “Limited Public Interest Objection” refers to the objection that the string comprising the potential new gTLD is contrary to generally accepted legal norms relating to morality and public order that are recognized under principles of international law.

(iv) “Community Objection” refers to the objection that there is substantial opposition to the application from a significant portion of the community to which the string may be explicitly or implicitly targeted.

(f) “DRSP Rules” are the rules of procedure of a particular DRSP that have been identified as being applicable to objection proceedings under this Procedure.

Article 3. Dispute Resolution Service Providers

The various categories of disputes shall be administered by the following DRSPs:

(a) String Confusion Objections shall be administered by the International Centre for Dispute Resolution.

(b) Existing Legal Rights Objections shall be administered by the Arbitration and Mediation Center of the World Intellectual Property Organization.

(c) Limited Public Interest Objections shall be administered by the International Centre for Expertise of the International Chamber of Commerce.

(d) Community Objections shall be administered by the International Centre for Expertise of the International Chamber of Commerce.

Article 4. Applicable Rules

(a) All proceedings before the Panel shall be governed by this Procedure and by the DRSP Rules that apply to a particular category of objection. The outcome of the proceedings shall be deemed an Expert Determination, and the members of the Panel shall act as experts.

(b) The applicable DRSP Rules are the following:

(i) For a String Confusion Objection, the applicable DRSP Rules are the ICDR Supplementary Procedures for ICANN’s New gTLD Program.

(ii) For an Existing Legal Rights Objection, the applicable DRSP Rules are the WIPO Rules for New gTLD Dispute Resolution.

(iii) For a Limited Public Interest Objection, the applicable DRSP Rules are the Rules for Expertise of the International Chamber of Commerce (ICC), as supplemented by the ICC as needed.

(iv) For a Community Objection, the applicable DRSP Rules are the Rules for Expertise of the International Chamber of Commerce (ICC), as supplemented by the ICC as needed.

(c) In the event of any discrepancy between this Procedure and the applicable DRSP Rules, this Procedure shall prevail.
(d) The place of the proceedings, if relevant, shall be the location of the DRSP that is administering the proceedings.

(e) In all cases, the Panel shall ensure that the parties are treated with equality, and that each party is given a reasonable opportunity to present its position.

Article 5. Language

(a) The language of all submissions and proceedings under this Procedure shall be English.

(b) Parties may submit supporting evidence in its original language, provided and subject to the authority of the Panel to determine otherwise, that such evidence is accompanied by a certified or otherwise official English translation of all relevant text.

Article 6. Communications and Time Limits

(a) All communications by the Parties with the DRSPs and Panels must be submitted electronically. A Party that wishes to make a submission that is not available in electronic form (e.g., evidentiary models) shall request leave from the Panel to do so, and the Panel, in its sole discretion, shall determine whether to accept the non-electronic submission.

(b) The DRSP, Panel, Applicant, and Objector shall provide copies to one another of all correspondence (apart from confidential correspondence between the Panel and the DRSP and among the Panel) regarding the proceedings.

(c) For the purpose of determining the date of commencement of a time limit, a notice or other communication shall be deemed to have been received on the day that it is transmitted in accordance with paragraphs (a) and (b) of this Article.

(d) For the purpose of determining compliance with a time limit, a notice or other communication shall be deemed to have been sent, made or transmitted if it is dispatched in accordance with paragraphs (a) and (b) of this Article prior to or on the day of the expiration of the time limit.

(e) For the purpose of calculating a period of time under this Procedure, such period shall begin to run on the day following the day when a notice or other communication is received.

(f) Unless otherwise stated, all time periods provided in the Procedure are calculated on the basis of calendar days.

Article 7. Filing of the Objection

(a) A person wishing to object to a new gTLD for which an application has been submitted may file an objection ("Objection"). Any Objection to a proposed new gTLD must be filed before the published closing date for the Objection Filing period.

(b) The Objection must be filed with the appropriate DRSP, using a model form made available by that DRSP, with copies to ICANN and the Applicant.

(c) The electronic addresses for filing Objections (the specific addresses shall be made available once they are created by providers):

   (i) A String Confusion Objection must be filed at: [●].
(ii) An Existing Legal Rights Objection must be filed at: [●].

(iii) A Limited Public Interest Objection must be filed at: [●].

(iv) A Community Objection must be filed at: [●].

(d) All Objections must be filed separately:

(i) An Objector who wishes to object to an application on more than one ground must file separate objections with the appropriate DRSP(s).

(ii) An Objector who wishes to object to more than one gTLD must file separate objections to each gTLD with the appropriate DRSP(s).

(e) If an Objection is filed with the wrong DRSP, that DRSP shall promptly notify the Objector of the error and that DRSP shall not process the incorrectly filed Objection. The Objector may then cure the error by filing its Objection with the correct DRSP within seven (7) days of receipt of the error notice, failing which the Objection shall be disregarded. If the Objection is filed with the correct DRSP within seven (7) days of receipt of the error notice but after the lapse of the time for submitting an Objection stipulation by Article 7(a) of this Procedure, it shall be deemed to be within this time limit.

Article 8. Content of the Objection

(a) The Objection shall contain, inter alia, the following information:

(i) The names and contact information (address, telephone number, email address, etc.) of the Objector;

(ii) A statement of the Objector's basis for standing; and

(iii) A description of the basis for the Objection, including:

   (aa) A statement of the ground upon which the Objection is being filed, as stated in Article 2(e) of this Procedure;

   (bb) An explanation of the validity of the Objection and why the objection should be upheld.

(b) The substantive portion of the Objection shall be limited to 5,000 words or 20 pages, whichever is less, excluding attachments. The Objector shall also describe and provide copies of any supporting or official documents upon which the Objection is based.

(c) At the same time as the Objection is filed, the Objector shall pay a filing fee in the amount set in accordance with the applicable DRSP Rules and include evidence of such payment in the Objection. In the event that the filing fee is not paid within ten (10) days of the receipt of the Objection by the DRSP, the Objection shall be dismissed without prejudice.

Article 9. Administrative Review of the Objection

(a) The DRSP shall conduct an administrative review of the Objection for the purpose of verifying compliance with Articles 5-8 of this Procedure and the applicable DRSP Rules, and inform the Objector, the Applicant and ICANN of the result of its review within
fourteen (14) days of its receipt of the Objection. The DRSP may extend this time limit for reasons explained in the notification of such extension.

(b) If the DRSP finds that the Objection complies with Articles 5-8 of this Procedure and the applicable DRSP Rules, the DRSP shall confirm that the Objection shall be registered for processing.

(c) If the DRSP finds that the Objection does not comply with Articles 5-8 of this Procedure and the applicable DRSP Rules, the DRSP shall have the discretion to request that any administrative deficiencies in the Objection be corrected within five (5) days. If the deficiencies in the Objection are cured within the specified period but after the lapse of the time limit for submitting an Objection stipulated by Article 7(a) of this Procedure, the Objection shall be deemed to be within this time limit.

(d) If the DRSP finds that the Objection does not comply with Articles 5-8 of this Procedure and the applicable DRSP Rules, and the deficiencies in the Objection are not corrected within the period specified in Article 9(c), the DRSP shall dismiss the Objection and close the proceedings, without prejudice to the Objector's submission of a new Objection that complies with this Procedure, provided that the Objection is filed within the deadline for filing such Objections. The DRSP's review of the Objection shall not interrupt the running of the time limit for submitting an Objection stipulated by Article 7(a) of this Procedure.

(e) Immediately upon registering an Objection for processing, pursuant to Article 9(b), the DRSP shall post the following information about the Objection on its website: (i) the proposed string to which the Objection is directed; (ii) the names of the Objector and the Applicant; (iii) the grounds for the Objection; and (iv) the dates of the DRSP's receipt of the Objection.

Article 10. ICANN's Dispute Announcement

(a) Within thirty (30) days of the deadline for filing Objections in relation to gTLD applications in a given round, ICANN shall publish a document on its website identifying all of the admissible Objections that have been filed (the "Dispute Announcement"). ICANN shall also directly inform each DRSP of the posting of the Dispute Announcement.

(b) ICANN shall monitor the progress of all proceedings under this Procedure and shall take steps, where appropriate, to coordinate with any DRSP in relation to individual applications for which objections are pending before more than one DRSP.

Article 11. Response to the Objection

(a) Upon receipt of the Dispute Announcement, each DRSP shall promptly send a notice to: (i) each Applicant for a new gTLD to which one or more admissible Objections have been filed with that DRSP; and (ii) the respective Objector(s).

(b) The Applicant shall file a response to each Objection (the “Response”). The Response shall be filed within thirty (30) days of the transmission of the notice by the DRSP pursuant to Article 11(a).

(c) The Response must be filed with the appropriate DRSP, using a model form made available by that DRSP, with copies to ICANN and the Objector.
(d) The Response shall contain, inter alia, the following information:

(i) The names and contact information (address, telephone number, email address, etc.) of the Applicant; and

(ii) A point-by-point response to the statements made in the Objection.

(e) The substantive portion of the Response shall be limited to 5,000 words or 20 pages, whichever is less, excluding attachments. The Applicant shall also describe and provide copies of any supporting or official documents upon which the Response is based.

(f) At the same time as the Response is filed, the Applicant shall pay a filing fee in the amount set and published by the relevant DRSP (which shall be the same as the filing fee paid by the Objector) and include evidence of such payment in the Response. In the event that the filing fee is not paid within ten (10) days of the receipt of the Response by the DRSP, the Applicant shall be deemed to be in default, any Response disregarded and the Objection shall be deemed successful.

(g) If the DRSP finds that the Response does not comply with Articles 11(c) and (d)(1) of this Procedure and the applicable DRSP Rules, the DRSP shall have the discretion to request that any administrative deficiencies in the Response be corrected within five (5) days. If the administrative deficiencies in the Response are cured within the specified period but after the lapse of the time limit for submitting a Response pursuant to this Procedure, the Response shall be deemed to be within this time limit.

(g) If the Applicant fails to file a Response to the Objection within the 30-day time limit, the Applicant shall be deemed to be in default and the Objection shall be deemed successful. No fees paid by the Applicant will be refunded in case of default.

Article 12. Consolidation of Objections

(a) The DRSP is encouraged, whenever possible and practicable, and as may be further stipulated in the applicable DRSP Rules, to consolidate Objections, for example, when more than one Objector has filed an Objection to the same gTLD on the same grounds. The DRSP shall endeavor to decide upon consolidation prior to issuing its notice pursuant to Article 11(a) and, where appropriate, shall inform the parties of the consolidation in that notice.

(b) If the DRSP itself has not decided to consolidate two or more Objections, any Applicant or Objector may propose the consolidation of Objections within seven (7) days of the notice given by the DRSP pursuant to Article 11(a). If, following such a proposal, the DRSP decides to consolidate certain Objections, which decision must be made within 14 days of the notice given by the DRSP pursuant to Article 11(a), the deadline for the Applicant's Response in the consolidated proceeding shall be thirty (30) days from the Applicant's receipt of the DRSP's notice of consolidation.

(c) In deciding whether to consolidate Objections, the DRSP shall weigh the benefits (in terms of time, cost, consistency of decisions, etc.) that may result from the consolidation against the possible prejudice or inconvenience that the consolidation may cause. The DRSP’s determination on consolidation shall be final and not subject to appeal.

(d) Objections based upon different grounds, as summarized in Article 2(e), shall not be consolidated.
Article 13. The Panel

(a) The DRSP shall select and appoint the Panel of Expert(s) within thirty (30) days after receiving the Response.

(b) Number and specific qualifications of Expert(s):

(i) There shall be one Expert in proceedings involving a String Confusion Objection.

(ii) There shall be one Expert or, if all of the Parties so agree, three Experts with relevant experience in intellectual property rights disputes in proceedings involving an Existing Legal Rights Objection.

(iii) There shall be three Experts recognized as eminent jurists of international reputation, one of whom shall be designated as the Chair. The Chair shall be of a nationality different from the nationalities of the Applicant and of the Objector, in proceedings involving a Limited Public Interest Objection.

(iv) There shall be one Expert in proceedings involving a Community Objection.

(c) All Experts acting under this Procedure shall be impartial and independent of the parties. The applicable DRSP Rules stipulate the manner by which each Expert shall confirm and maintain their impartiality and independence.

(d) The applicable DRSP Rules stipulate the procedures for challenging an Expert and replacing an Expert.

(e) Unless required by a court of law or authorized in writing by the parties, an Expert shall not act in any capacity whatsoever, in any pending or future proceedings, whether judicial, arbitral or otherwise, relating to the matter referred to expert determination under this Procedure.

Article 14. Costs

(a) Each DRSP shall determine the costs for the proceedings that it administers under this Procedure in accordance with the applicable DRSP Rules. Such costs shall cover the fees and expenses of the members of the Panel, as well as the administrative fees of the DRSP (the “Costs”).

(b) Within ten (10) days of constituting the Panel, the DRSP shall estimate the total Costs and request the Objector and the Applicant/Respondent each to pay in advance the full amount of the Costs to the DRSP. Each party shall make its advance payment of Costs within ten (10) days of receiving the DRSP’s request for payment and submit to the DRSP evidence of such payment. The respective filing fees paid by the Parties shall be credited against the amounts due for this advance payment of Costs.

(c) The DRSP may revise its estimate of the total Costs and request additional advance payments from the parties during the proceedings.

(d) Failure to make an advance payment of Costs:

(i) If the Objector fails to make the advance payment of Costs, its Objection shall be dismissed and no fees that it has paid shall be refunded.
(ii) If the Applicant fails to make the advance payment of Costs, the Objection will be deemed to have been sustained and no fees that the Applicant has paid shall be refunded.

(e) Upon the termination of the proceedings, after the Panel has rendered its Expert Determination, the DRSP shall refund to the prevailing party, as determined by the Panel, its advance payment(s) of Costs.

Article 15. Representation and Assistance

(a) The parties may be represented or assisted by persons of their choice.

(b) Each party or party representative shall communicate the name, contact information and function of such persons to the DRSP and the other party (or parties in case of consolidation).

Article 16. Negotiation and Mediation

(a) The parties are encouraged, but not required, to participate in negotiations and/or mediation at any time throughout the dispute resolution process aimed at settling their dispute amicably.

(b) Each DRSP shall be able to propose, if requested by the parties, a person who could assist the parties as mediator.

(c) A person who acts as mediator for the parties shall not serve as an Expert in a dispute between the parties under this Procedure or any other proceeding under this Procedure involving the same gTLD.

(d) The conduct of negotiations or mediation shall not, ipso facto, be the basis for a suspension of the dispute resolution proceedings or the extension of any deadline under this Procedure. Upon the joint request of the parties, the DRSP or (after it has been constituted) the Panel may grant the extension of a deadline or the suspension of the proceedings. Absent exceptional circumstances, such extension or suspension shall not exceed thirty (30) days and shall not delay the administration of any other Objection.

(e) If, during negotiations and/or mediation, the parties agree on a settlement of the matter referred to the DRSP under this Procedure, the parties shall inform the DRSP, which shall terminate the proceedings, subject to the parties’ payment obligation under this Procedure having been satisfied, and inform ICANN and the parties accordingly.

Article 17. Additional Written Submissions

(a) The Panel may decide whether the parties shall submit any written statements in addition to the Objection and the Response, and it shall fix time limits for such submissions.

(b) The time limits fixed by the Panel for additional written submissions shall not exceed thirty (30) days, unless the Panel, having consulted the DRSP, determines that exceptional circumstances justify a longer time limit.
Article 18. Evidence

In order to achieve the goal of resolving disputes over new gTLDs rapidly and at reasonable cost, procedures for the production of documents shall be limited. In exceptional cases, the Panel may require a party to provide additional evidence.

Article 19. Hearings

(a) Disputes under this Procedure and the applicable DRSP Rules will usually be resolved without a hearing.

(b) The Panel may decide, on its own initiative or at the request of a party, to hold a hearing only in extraordinary circumstances.

(c) In the event that the Panel decides to hold a hearing:
   
   (i) The Panel shall decide how and where the hearing shall be conducted.
   
   (ii) In order to expedite the proceedings and minimize costs, the hearing shall be conducted by videoconference if possible.
   
   (iii) The hearing shall be limited to one day, unless the Panel decides, in exceptional circumstances, that more than one day is required for the hearing.
   
   (iv) The Panel shall decide whether the hearing will be open to the public or conducted in private.

Article 20. Standards

(a) For each category of Objection identified in Article 2(e), the Panel shall apply the standards that have been defined by ICANN.

(b) In addition, the Panel may refer to and base its findings upon the statements and documents submitted and any rules or principles that it determines to be applicable.

(c) The Objector bears the burden of proving that its Objection should be sustained in accordance with the applicable standards.

Article 21. The Expert Determination

(a) The DRSP and the Panel shall make reasonable efforts to ensure that the Expert Determination is rendered within forty-five (45) days of the constitution of the Panel. In specific circumstances such as consolidated cases and in consultation with the DRSP, if significant additional documentation is requested by the Panel, a brief extension may be allowed.

(b) The Panel shall submit its Expert Determination in draft form to the DRSP’s scrutiny as to form before it is signed, unless such scrutiny is specifically excluded by the applicable DRSP Rules. The modifications proposed by the DRSP to the Panel, if any, shall address only the form of the Expert Determination. The signed Expert Determination shall be communicated to the DRSP, which in turn will communicate that Expert Determination to the Parties and ICANN.

(c) When the Panel comprises three Experts, the Expert Determination shall be made by a majority of the Experts.
(d) The Expert Determination shall be in writing, shall identify the prevailing party and shall state the reasons upon which it is based. The remedies available to an Applicant or an Objector pursuant to any proceeding before a Panel shall be limited to the success or dismissal of an Objection and to the refund by the DRSP to the prevailing party, as determined by the Panel in its Expert Determination, of its advance payment(s) of Costs pursuant to Article 14(e) of this Procedure and any relevant provisions of the applicable DRSP Rules.

(e) The Expert Determination shall state the date when it is made, and it shall be signed by the Expert(s). If any Expert fails to sign the Expert Determination, it shall be accompanied by a statement of the reason for the absence of such signature.

(f) In addition to providing electronic copies of its Expert Determination, the Panel shall provide a signed hard copy of the Expert Determination to the DRSP, unless the DRSP Rules provide for otherwise.

(g) Unless the Panel decides otherwise, the Expert Determination shall be published in full on the DRSP’s website.

Article 22. Exclusion of Liability

In addition to any exclusion of liability stipulated by the applicable DRSP Rules, neither the Expert(s), nor the DRSP and its employees, nor ICANN and its Board members, employees and consultants shall be liable to any person for any act or omission in connection with any proceeding conducted under this Procedure.

Article 23. Modification of the Procedure

(a) ICANN may from time to time, in accordance with its Bylaws, modify this Procedure.

(b) The version of this Procedure that is applicable to a dispute resolution proceeding is the version that was in effect on the day when the relevant application for a new gTLD is submitted.
International Centre for Dispute Resolution (ICDR)

Fees & Costs Schedule for String Confusion Objections
(Fee Schedule)

May 20, 2010

Administrative Filing Fees (non-refundable)

- US $2750 Filing Fee; per party; per objection. This amount is due on all objections filed.

- US $1250\(^1\) Case Service Fee; per party; per objection. This additional amount only becomes due if any type of hearing is conducted in accordance with Article 19 of the gTLD Dispute Resolution Procedures.

Neutral Panel Compensation (limited to one arbitrator)

- US $6000\(^2\) per objector/applicant. This is collected for all cases to be heard on documents only and includes all arbitrator expenses.

- US $3000\(^3\) per party. This is billed if any type of hearing is conducted.
  - Same amount billed for each additional day of hearing beyond one day.
  - Includes all travel time of the neutral.
  - Does not include travel expenses which will be billed separately.

\(^1\)See Article 19 of the gTLD Dispute Resolution Procedures.
\(^2\)See Article 14(b) of the gTLD Dispute Resolution Procedures.
\(^3\)See Article 14(c) of the gTLD Dispute Resolution Procedures.
International Centre for Dispute Resolution (ICDR)

Supplementary Procedures for String Confusion Objections (Rules)

10 January 2012

Impartiality and Independence of Experts

Article 1

1. Dispute Resolution Panelists, who shall be referred to as “Experts”, acting under the New gTLD DISPUTE RESOLUTION PROCEDURES and these Rules shall be impartial and independent. Prior to accepting appointment, a prospective Expert shall disclose to the Dispute Resolution Service Provider (DRSP) any circumstance likely to give rise to justifiable doubts as to the Expert’s impartiality or independence. If, at any stage during the proceedings, new circumstances arise that may give rise to such doubts, an Expert shall promptly disclose such circumstances to the parties and to the DRSP. Upon receipt of such information from an Expert or a party, the DRSP shall communicate it to the other parties and to the panel.

2. No party or anyone acting on its behalf shall have any ex parte communication relating to the case with any Expert.

Challenge of Experts

Article 2

1. A party may challenge any Expert whenever circumstances exist that give rise to justifiable doubts as to the Expert’s impartiality or independence. A party wishing to challenge an Expert shall send notice of the challenge to the DRSP within 10 days after being notified of the appointment of the Expert or within 10 days after the circumstances giving rise to the challenge become known to that party.

2. The challenge shall state in writing the reasons for the challenge.

3. Upon receipt of such a challenge, the DRSP shall notify the other parties of the challenge. Upon review of the challenge the DRSP in its sole discretion shall make the decision on the challenge and advise the parties of its decision. The challenged Expert may also withdraw from office upon notice of the challenge.
Replacement of an Expert

Article 3

If an Expert withdraws after a challenge, or the DRSP sustains the challenge, or the DRSP determines that there are sufficient reasons to accept the resignation of an Expert, or an Expert dies, a substitute Expert shall be appointed pursuant to the provisions of Article 13 of the gTLD Dispute Resolution Procedures.

Waiver of Rules

Article 4

A party who knows that any provision of the Rules or requirement under the Rules has not been complied with, but proceeds with the arbitration without promptly stating an objection in writing thereto, shall be deemed to have waived the right to object.

Confidentiality

Article 5

Confidential information disclosed during the proceedings by the parties, counsel, or by witnesses shall not be divulged by an Expert or by the DRSP.

Interpretation of Rules

Article 6

The Expert shall interpret and apply these Rules insofar as they relate to its powers and duties. The DRSP shall interpret and apply all other Rules.

Exclusion of Liability

Article 7

1. Neither the International Centre for Dispute Resolution (ICDR), the American Arbitration Association (AAA), nor any Expert in a proceeding under the New gTLD Dispute Resolution Procedures and/or these Rules is a necessary or proper party in judicial proceedings relating to the Objection proceeding.
2. Parties to an Objection proceeding under the New .gTLD Dispute Resolution Procedures and/or these Rules shall be deemed to have consented that neither the ICDR, the AAA, nor any Expert shall be liable to any party in any action for damages or injunctive relief for any act or omission in connection with any Objection proceeding under the gTLD Dispute Resolution Procedures and/or these Rules.

World Intellectual Property Organization Schedule of Fees and Costs: New gTLD Pre-Delegation Legal Rights Objection Procedure

All Other Scenarios

In all other scenarios, the DRSP shall determine the applicable fees in consultation with the Panel, taking into account the base fees stipulated above and the circumstances of the consolidated objections and applications.

Additional Advance Payments

Depending on the circumstances of the case, additional advance payments may be required to be made. In determining whether additional advance payments shall be required, the DRSP, in consultation with the Panel, may consider the following non-exclusive factors: the number of Applications and/or Objections to the TLD, the number of parties, the complexity of the dispute, the anticipated time required for rendering an Expert Determination, and the possible need for hearings, phone or video conferences, or additional pleading rounds.
World Intellectual Property Organization
Rules for New gTLD Dispute Resolution for Existing Legal Rights Objections
(“WIPO Rules for New gTLD Dispute Resolution”)  
(In effect as of June 20, 2011)

1. Scope of WIPO Rules for New gTLD Dispute Resolution in Relation to Procedure

(a) Set out below are the applicable WIPO Rules for New gTLD Dispute Resolution for Existing Legal Rights Objections as referred to in Article 4 of the New gTLD Dispute Resolution Procedure (“Procedure”) as approved by the Internet Corporation for Assigned Names and Numbers (“ICANN”) on June 20, 2011. The WIPO Rules for New gTLD Dispute Resolution are to be read and used in connection with the Procedure which provides the basic framework for the four categories of objections (as referred to in Articles 2 and 4 of the Procedure) arising from Applications under ICANN’s New gTLD Program.

(b) The version of the WIPO Rules for New gTLD Dispute Resolution applicable to a proceeding conducted under the Procedure is the version in effect on the day when the relevant Application for a new gTLD is submitted (as referred to in Article 23(b) of the Procedure).

2. Definitions

Terms defined in the Procedure shall have the same meaning in the WIPO Rules for New gTLD Dispute Resolution. Words used in the singular shall include the plural and vice versa as the context may require.

3. Communications

(a) Subject to Article 6 of the Procedure, except where otherwise agreed beforehand with the WIPO Arbitration and Mediation Center (“Center”), and subject to the discretion of any appointed Panel, any submission to the Center or to the Panel shall be made by electronic mail (email) using arbiter.mail@wipo.int.

(b) In the event a party wishes to submit a hard copy or other non-electronic submission prior to Panel appointment, it shall first request leave to do so from the Center; the Center shall, in its sole discretion, then determine whether to accept the non-electronic submission. After Panel appointment, parties are referred to Article 6(a) of the Procedure.
4. Submission of Objection and Response

(a) In accordance with Articles 7 and 8 of the Procedure, the Objector shall transmit its Objection using the Objection Model Form set out in Annex A hereto and posted on the Center’s website and shall comply with the Center’s Filing Guidelines set out in Annex B hereto and posted on the Center’s website.

(b) In accordance with Article 11 of the Procedure, the Applicant shall transmit its Response using the Response Model Form set out in Annex C hereto and posted on the Center’s website and shall comply with the Center’s Filing Guidelines set out in Annex B hereto and posted on the Center’s website.

5. Center Review of Objections

(a) In accordance with Article 9 of the Procedure if an Objection is dismissed due to the Objector’s failure to remedy an administrative deficiency, there shall be no refund of any DRSP Fee paid by the Objector pursuant to Article 14 of the Procedure and Paragraph 10 of the WIPO Rules for New gTLD Dispute Resolution.

(b) If an Objector submits a new Objection within ten (10) calendar days of closure of a proceeding as provided in Article 9(d) of the Procedure and Paragraph 5(a) of the WIPO Rules for New gTLD Dispute Resolution to remedy an administratively deficient Objection, such new Objection may be accompanied by a request for a DRSP Fee waiver, in whole or in part, for the Center’s consideration in its sole discretion.

6. Appointment of Case Manager

(a) The Center shall advise the parties of the name and contact details of the Case Manager who shall be responsible for all administrative matters relating to the dispute and communications to the Panel.

(b) The Case Manager may provide administrative assistance to the parties or Panel, but shall have no authority to decide matters of a substantive nature concerning the dispute.

7. Consolidation

(a) In accordance with Article 12 of the Procedure, the Center may, where possible and practicable, and in its sole discretion, decide to consolidate Objections by appointing the same Panel to decide multiple Objections sharing certain commonalities. In the event of consolidation, the Panel shall render individual Expert Determinations for each Objection.

(b) A party may submit a consolidation request pursuant to Article 12(b) of the Procedure, or may oppose any consolidation request submitted. Any such opposition to a consolidation request shall be provided within seven (7) calendar days of the consolidation request. Any consolidation request or opposition thereto shall be limited to 1,500 words in length.

(c) In the case of consolidated Objections, the applicable reduced Panel fees are specified in Annex D hereto and posted on the Center’s website.
(d) Pursuant to Article 12 of the Procedure, in weighing the benefits that may result from consolidation against the possible prejudice or inconvenience that consolidation may cause, the Center in reaching its decision concerning consolidation, may take into account, inter alia, the following non-exclusive factors:

(i) Whether the Objections concern the same or similar TLD(s);

(ii) Whether the same Objector files Objections concerning multiple TLD applications;

(iii) Whether in any consolidation request, or opposition thereto, the Objector or Applicant relies on single or multiple mark(s);

(iv) The scope of evidence relied on by an Objector or Applicant in any Objection or application;

(v) Any other arguments raised in any consolidation request, or opposition thereto;

(vi) Expert availability to accept appointment.

(e) The Center’s decision on any consolidation of multiple Objections for Expert Determination by the same Panel is of an administrative nature and shall be final. The Center shall not be required to state reasons for its decision.

8. Panel Appointment Procedures

(a) The Center will maintain and publish on its website a publicly-available List of Experts.

(b) Pursuant to Article 13(b)(ii) of the Procedure, there shall be a Single-Expert Panel unless all the Parties agree to the appointment of a Three-Expert Panel.

(c) In the event of a Single-Expert Panel, the Center shall in its sole discretion appoint an Expert from its List of Experts.

(d) In the event all the Parties agree to the appointment of a Three-Expert Panel, any such agreement shall be communicated to the Center within five (5) calendar days of the Center’s receipt of the Response filed in accordance with Article 11 of the Procedure and Paragraph 4(b) of the WIPO Rules for New gTLD Dispute Resolution.

(i) If Objections are not consolidated, and if the parties have communicated their agreement on the appointment of a Three-Expert Panel, within five (5) days of such communication each party shall separately submit to the Center (notwithstanding Article 6(b) of the Procedure) the names of three (3) candidates from the Center’s List of Experts, in the order of their respective preference, for appointment by the Center as a Co-Expert. In the event none of a party’s three (3) candidates is available for appointment as a Co-Expert, the Center shall appoint the Co-Expert in its sole discretion.
(ii) In the event of consolidation in accordance with Paragraph 7 of the WIPO Rules for New gTLD Dispute Resolution, the Objectors or Applicants shall, as the case may be, jointly submit the names of the three (3) candidates from the Center’s List of Experts in order of preference (i.e., one list on behalf of all Objector(s) and one list on behalf of all Applicant(s)). If the Objectors or Applicants as the case may be do not jointly agree on and submit the names of three (3) candidates within five (5) calendar days of the parties’ communication to the Center on their agreement to the appointment of a Three-Expert Panel, the Center shall in its sole discretion appoint the Co-Experts.

(iii) The third Expert, who shall be the Presiding Expert, shall absent exceptional circumstances be appointed by the Center from a list of five (5) candidates submitted by the Center to the parties. The Center’s selection of a Presiding Expert shall be made in a manner that seeks to reasonably balance the preferences of each party as communicated to the Center within five (5) calendar days of the Center’s communication of the list of candidates to the parties.

(iv) Where any party fails to indicate its order of preference for the Presiding Expert to the Center, the Center shall nevertheless proceed to appoint the Presiding Expert in its sole discretion, taking into account any preferences of any other party.

9. Expert Impartiality and Independence

(a) In accordance with Article 13(c) of the Procedure, any prospective Expert shall, before accepting appointment, disclose to the Center and parties any circumstance that might give rise to justifiable doubt as to the Expert’s impartiality or independence, or confirm in writing that no such circumstance exist by submitting to the Center a Declaration of Impartiality and Independence using the form set out in Annex E hereto and posted on the Center’s website.

(b) If at any stage during a proceeding conducted under the Procedure, circumstances arise that might give rise to justifiable doubt as to an Expert’s impartiality or independence, the Expert shall promptly disclose such circumstances to the parties and the Center.

(c) A party may challenge an Expert if circumstances exist which give rise to justifiable doubt as to the Expert’s impartiality or independence. A party may challenge an Expert whom it has appointed or in whose appointment it concurred, only for reasons of which it becomes aware after the appointment has been made.

(i) A party challenging an Expert shall send notice to the Center and the other party, stating the reasons for the challenge, within five (5) calendar days after being notified of that Expert’s appointment or becoming aware of circumstances that it considers give rise to justifiable doubt as to that Expert’s impartiality or independence.

(ii) The decision on the challenge shall be made by the Center in its sole discretion. Such a decision is of an administrative nature and shall be final. The Center shall not be required to state reasons for its decision. In the event of an Expert’s removal, the Center shall appoint a new Expert in accordance with the Procedure and these WIPO Rules for New gTLD Dispute Resolution.
10. Fees

(a) The applicable fees for the Procedure for Existing Legal Rights Objections are specified in Annex D hereto and posted on the Center’s website.

(b) After the Expert Determination has been rendered or a proceeding conducted under the Procedure has been terminated, the Center shall provide an accounting to the parties of the payments received and, in consultation with any Panel, return any unexpended balance of the Panel Fee to the parties.

11. Confidentiality

(a) A party invoking the confidentiality of any information it wishes or is required to submit in any Existing Legal Rights Objection proceeding conducted under the Procedure, shall submit the request for confidentiality to the Center for the Panel's consideration, stating the reasons for which it considers the information to be confidential. If the Panel decides that the information is to be treated as confidential, it shall decide under which conditions and to whom the confidential information may in part or in whole be disclosed and shall require any person to whom the confidential information is to be disclosed to sign an appropriate confidentiality undertaking.

(b) Further to Article 6(b) of the Procedure, except in exceptional circumstances as decided by the Panel and in consultation with the parties and the Center, no party or anyone acting on its behalf shall have any ex parte communication with the Panel.

12. Mediation

Further to Article 16 of the Procedure, prior to the Panel rendering its Expert Determination in a proceeding conducted under the Procedure, the parties may inform the Center that they wish to participate in mediation to attempt to resolve the dispute and may request the Center to administer the mediation. In such event, unless both parties agree otherwise, the WIPO Mediation Rules shall apply mutatis mutandis. On request from the parties, and absent exceptional circumstances, the Center’s mediation administration fee shall be waived.

13. Effect of Court Proceedings

(a) The Objector and Applicant shall include in any Objection or Response relevant information regarding any other legal proceedings concerning the TLD. In the event that a party initiates any legal proceedings during the pendency of a proceeding conducted under the Procedure, it shall promptly notify the Center.

(b) In the event of any legal proceedings initiated prior to or during a proceeding conducted under the Procedure, the Panel shall have the discretion to decide whether to suspend or terminate such proceeding under the Procedure, or to proceed to an Expert Determination.
14. Termination

(a) If, before the Panel renders an Expert Determination, it becomes unnecessary or impossible to continue a proceeding conducted under the Procedure for any reason, the Panel may in its discretion terminate the proceeding.

(b) If, prior to Panel appointment, it becomes unnecessary or impossible to continue a proceeding conducted under the Procedure for any reason, the Center in consultation with the parties and ICANN, may in its discretion terminate the proceeding.

15. Amendments

Subject to the Procedure, the Center may amend these WIPO Rules for New gTLD Dispute Resolution in its sole discretion.

16. Exclusion of Liability

Except in respect of deliberate wrongdoing, an Expert, the World Intellectual Property Organization, and the Center shall not be liable to any party or ICANN for any act or omission in connection with any proceeding conducted under the Procedure and the WIPO Rules for New gTLD Dispute Resolution.
Module 4
String Contention Procedures

This module describes situations in which contention over applied-for gTLD strings occurs, and the methods available to applicants for resolving such contention cases.

4.1 String Contention

String contention occurs when either:

1. Two or more applicants for an identical gTLD string successfully complete all previous stages of the evaluation and dispute resolution processes; or

2. Two or more applicants for similar gTLD strings successfully complete all previous stages of the evaluation and dispute resolution processes, and the similarity of the strings is identified as creating a probability of user confusion if more than one of the strings is delegated.

ICANN will not approve applications for proposed gTLD strings that are identical or that would result in user confusion, called contending strings. If either situation above occurs, such applications will proceed to contention resolution through either community priority evaluation, in certain cases, or through an auction. Both processes are described in this module. A group of applications for contending strings is referred to as a contention set.

(In this Applicant Guidebook, “similar” means strings so similar that they create a probability of user confusion if more than one of the strings is delegated into the root zone.)

4.1.1 Identification of Contention Sets

Contention sets are groups of applications containing identical or similar applied-for gTLD strings. Contention sets are identified during Initial Evaluation, following review of all applied-for gTLD strings. ICANN will publish preliminary contention sets once the String Similarity review is completed, and will update the contention sets as necessary during the evaluation and dispute resolution stages.
Applications for identical gTLD strings will be automatically assigned to a contention set. For example, if Applicant A and Applicant B both apply for .TLDSTRING, they will be identified as being in a contention set. Such testing for identical strings also takes into consideration the code point variants listed in any relevant IDN table. That is, two or more applicants whose applied-for strings or designated variants are variant strings according to an IDN table submitted to ICANN would be considered in direct contention with one another. For example, if one applicant applies for string A and another applies for string B, and strings A and B are variant TLD strings as defined in Module 1, then the two applications are in direct contention.

The String Similarity Panel will also review the entire pool of applied-for strings to determine whether the strings proposed in any two or more applications are so similar that they would create a probability of user confusion if allowed to coexist in the DNS. The panel will make such a determination for each pair of applied-for gTLD strings. The outcome of the String Similarity review described in Module 2 is the identification of contention sets among applications that have direct or indirect contention relationships with one another.

Two strings are in direct contention if they are identical or similar to one another. More than two applicants might be represented in a direct contention situation: if four different applicants applied for the same gTLD string, they would all be in direct contention with one another.

Two strings are in indirect contention if they are both in direct contention with a third string, but not with one another. The example that follows explains direct and indirect contention in greater detail.

In Figure 4-1, Strings A and B are an example of direct contention. Strings C and G are an example of indirect contention. C and G both contend with B, but not with one another. The figure as a whole is one contention set. A contention set consists of all applications that are linked by string contention to one another, directly or indirectly.
Figure 4-1 – This diagram represents one contention set, featuring both directly and indirectly contending strings.

While preliminary contention sets are determined during Initial Evaluation, the final configuration of the contention sets can only be established once the evaluation and dispute resolution process stages have concluded. This is because any application excluded through those processes might modify a contention set identified earlier.

A contention set may be augmented, split into two sets, or eliminated altogether as a result of an Extended Evaluation or dispute resolution proceeding. The composition of a contention set may also be modified as some applications may be voluntarily withdrawn throughout the process.

Refer to Figure 4-2: In contention set 1, applications D and G are eliminated. Application A is the only remaining application, so there is no contention left to resolve.

In contention set 2, all applications successfully complete Extended Evaluation and Dispute Resolution, so the original contention set remains to be resolved.

In contention set 3, application F is eliminated. Since application F was in direct contention with E and J, but E and J are not in contention with one another, the original contention set splits into two sets: one containing E and K in direct contention, and one containing I and J.
Figure 4-2 – Resolution of string contention cannot begin until all applicants within a contention set have completed all applicable previous stages.

The remaining contention cases must then be resolved through community priority evaluation or by other means, depending on the circumstances. In the string contention resolution stage, ICANN addresses each contention set to achieve an unambiguous resolution.

As described elsewhere in this guidebook, cases of contention might be resolved by community priority evaluation or an agreement among the parties. Absent that, the last-resort contention resolution mechanism will be an auction.

4.1.2 Impact of String Confusion Dispute Resolution Proceedings on Contention Sets

If an applicant files a string confusion objection against another application (refer to Module 3), and the panel finds that user confusion is probable (that is, finds in favor of the objector), the two applications will be placed in direct contention with each other. Thus, the outcome of a dispute resolution proceeding based on a string confusion objection would be a new contention set structure for the relevant applications, augmenting the original contention set.

If an applicant files a string confusion objection against another application, and the panel finds that string
confusion does not exist (that is, finds in favor of the responding applicant), the two applications will not be considered in direct contention with one another.

A dispute resolution outcome in the case of a string confusion objection filed by another applicant will not result in removal of an application from a previously established contention set.

4.1.3 Self-Resolution of String Contention

Applicants that are identified as being in contention are encouraged to reach a settlement or agreement among themselves that resolves the contention. This may occur at any stage of the process, once ICANN publicly posts the applications received and the preliminary contention sets on its website.

Applicants may resolve string contention in a manner whereby one or more applicants withdraw their applications. An applicant may not resolve string contention by selecting a new string or by replacing itself with a joint venture. It is understood that applicants may seek to establish joint ventures in their efforts to resolve string contention. However, material changes in applications (for example, combinations of applicants to resolve contention) will require re-evaluation. This might require additional fees or evaluation in a subsequent application round. Applicants are encouraged to resolve contention by combining in a way that does not materially affect the remaining application. Accordingly, new joint ventures must take place in a manner that does not materially change the application, to avoid being subject to re-evaluation.

4.1.4 Possible Contention Resolution Outcomes

An application that has successfully completed all previous stages and is no longer part of a contention set due to changes in the composition of the contention set (as described in subsection 4.1.1) or self-resolution by applicants in the contention set (as described in subsection 4.1.3) may proceed to the next stage.

An application that prevails in a contention resolution procedure, either community priority evaluation or auction, may proceed to the next stage.
In some cases, an applicant who is not the outright winner of a string contention resolution process can still proceed. This situation is explained in the following paragraphs.

If the strings within a given contention set are all identical, the applications are in direct contention with each other and there can only be one winner that proceeds to the next step.

However, where there are both direct and indirect contention situations within a set, more than one string may survive the resolution.

For example, consider a case where string A is in contention with B, and B is in contention with C, but C is not in contention with A. If A wins the contention resolution procedure, B is eliminated but C can proceed since C is not in direct contention with the winner and both strings can coexist in the DNS without risk for confusion.

### 4.2 Community Priority Evaluation

Community priority evaluation will only occur if a community-based applicant selects this option. Community priority evaluation can begin once all applications in the contention set have completed all previous stages of the process.

The community priority evaluation is an independent analysis. Scores received in the applicant reviews are not carried forward to the community priority evaluation. Each application participating in the community priority evaluation begins with a score of zero.

#### 4.2.1 Eligibility for Community Priority Evaluation

As described in subsection 1.2.3 of Module 1, all applicants are required to identify whether their application type is:

- Community-based; or
- Standard.

Applicants designating their applications as community-based are also asked to respond to a set of questions in the application form to provide relevant information if a community priority evaluation occurs.

Only community-based applicants are eligible to participate in a community priority evaluation.
At the start of the contention resolution stage, all community-based applicants within remaining contention sets will be notified of the opportunity to opt for a community priority evaluation via submission of a deposit by a specified date. Only those applications for which a deposit has been received by the deadline will be scored in the community priority evaluation. Following the evaluation, the deposit will be refunded to applicants that score 14 or higher.

Before the community priority evaluation begins, the applicants who have elected to participate may be asked to provide additional information relevant to the community priority evaluation.

4.2.2 Community Priority Evaluation Procedure

Community priority evaluations for each eligible contention set will be performed by a community priority panel appointed by ICANN to review these applications. The panel’s role is to determine whether any of the community-based applications fulfills the community priority criteria. Standard applicants within the contention set, if any, will not participate in the community priority evaluation.

If a single community-based application is found to meet the community priority criteria (see subsection 4.2.3 below), that applicant will be declared to prevail in the community priority evaluation and may proceed. If more than one community-based application is found to meet the criteria, the remaining contention between them will be resolved as follows:

- In the case where the applications are in indirect contention with one another (see subsection 4.1.1), they will both be allowed to proceed to the next stage. In this case, applications that are in direct contention with any of these community-based applications will be eliminated.

- In the case where the applications are in direct contention with one another, these applicants will proceed to an auction. If all parties agree and present a joint request, ICANN may postpone the auction for a three-month period while the parties attempt to reach a settlement before proceeding to auction. This is a one-time option; ICANN will grant no more than one such request for each set of contending applications.
If none of the community-based applications are found to meet the criteria, then all of the parties in the contention set (both standard and community-based applicants) will proceed to an auction.

Results of each community priority evaluation will be posted when completed.

Applicants who are eliminated as a result of a community priority evaluation are eligible for a partial refund of the gTLD evaluation fee (see Module 1).

4.2.3 Community Priority Evaluation Criteria

The Community Priority Panel will review and score the one or more community-based applications having elected the community priority evaluation against four criteria as listed below.

The scoring process is conceived to identify qualified community-based applications, while preventing both “false positives” (awarding undue priority to an application that refers to a “community” construed merely to get a sought-after generic word as a gTLD string) and “false negatives” (not awarding priority to a qualified community application). This calls for a holistic approach, taking multiple criteria into account, as reflected in the process. The scoring will be performed by a panel and be based on information provided in the application plus other relevant information available (such as public information regarding the community represented). The panel may also perform independent research, if deemed necessary to reach informed scoring decisions.

It should be noted that a qualified community application eliminates all directly contending standard applications, regardless of how well qualified the latter may be. This is a fundamental reason for very stringent requirements for qualification of a community-based application, as embodied in the criteria below. Accordingly, a finding by the panel that an application does not meet the scoring threshold to prevail in a community priority evaluation is not necessarily an indication the community itself is in some way inadequate or invalid.

The sequence of the criteria reflects the order in which they will be assessed by the panel. The utmost care has been taken to avoid any “double-counting” - any negative aspect found in assessing an application for one criterion
should only be counted there and should not affect the assessment for other criteria.

An application must score at least 14 points to prevail in a community priority evaluation. The outcome will be determined according to the procedure described in subsection 4.2.2.

**Criterion #1: Community Establishment (0-4 points)**

A maximum of 4 points is possible on the Community Establishment criterion:

<table>
<thead>
<tr>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community Establishment</td>
<td>community establishment</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As measured by:

A. **Delineation (2)**

<table>
<thead>
<tr>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clearly delineated, organized, and pre-existing community.</td>
<td>Clearly delineated and pre-existing community, but not fulfilling the requirements for a score of 1.</td>
<td>Insufficient delineation and pre-existence for a score of 2.</td>
</tr>
</tbody>
</table>

B. **Extension (2)**

<table>
<thead>
<tr>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community of considerable size and longevity.</td>
<td>Community of either considerable size or longevity, but not fulfilling the requirements for a score of 2.</td>
<td>Community of neither considerable size nor longevity.</td>
</tr>
</tbody>
</table>

This section relates to the community as explicitly identified and defined according to statements in the application. (The implicit reach of the applied-for string is not
considered here, but taken into account when scoring Criterion #2, “Nexus between Proposed String and Community.”)

**Criterion 1 Definitions**

- **“Community”** - Usage of the expression “community” has evolved considerably from its Latin origin – “communitas” meaning “fellowship” – while still implying more of cohesion than a mere commonality of interest. Notably, as “community” is used throughout the application, there should be:
  1. an awareness and recognition of a community among its members;
  2. some understanding of the community’s existence prior to September 2007 (when the new gTLD policy recommendations were completed); and
  3. extended tenure or longevity—non-transience—into the future.

- **“Delineation”** relates to the membership of a community, where a clear and straightforward membership definition scores high, while an unclear, dispersed or unbound definition scores low.

- **“Pre-existing”** means that a community has been active as such since before the new gTLD policy recommendations were completed in September 2007.

- **“Organized”** implies that there is at least one entity mainly dedicated to the community, with documented evidence of community activities.

- **“Extension”** relates to the dimensions of the community, regarding its number of members, geographical reach, and foreseeable activity lifetime, as further explained in the following.

- **“Size”** relates both to the number of members and the geographical reach of the community, and will be scored depending on the context rather than on absolute numbers - a geographic location community may count millions of members in a limited location, a language community may have a million members with some spread over the globe, a community of service providers may have "only" some hundred members although well spread over the globe, just to mention some examples - all these can be regarded as of "considerable size."
"Longevity" means that the pursuits of a community are of a lasting, non-transient nature.

**Criterion 1 Guidelines**

With respect to “Delineation” and “Extension,” it should be noted that a community can consist of legal entities (for example, an association of suppliers of a particular service), of individuals (for example, a language community) or of a logical alliance of communities (for example, an international federation of national communities of a similar nature). All are viable as such, provided the requisite awareness and recognition of the community is at hand among the members. Otherwise the application would be seen as not relating to a real community and score 0 on both “Delineation” and “Extension.”

With respect to “Delineation,” if an application satisfactorily demonstrates all three relevant parameters (delineation, pre-existing and organized), then it scores a 2.

With respect to “Extension,” if an application satisfactorily demonstrates both community size and longevity, it scores a 2.

**Criterion #2: Nexus between Proposed String and Community (0-4 points)**

A maximum of 4 points is possible on the Nexus criterion:

```
4 3 2 1 0

Nexus between String & Community

High          Low
```

As measured by:

**A. Nexus (3)**

<table>
<thead>
<tr>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>The string matches the name of the community or is a well-known short-form or abbreviation of the community</td>
<td>String identifies the community, but does not quality for a score of 3.</td>
<td>String nexus does not fulfill the requirements for a score of 2.</td>
</tr>
</tbody>
</table>
B. **Uniqueness (1)**

<table>
<thead>
<tr>
<th>Score</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>String has no other significant meaning beyond identifying the community described in the application.</td>
</tr>
<tr>
<td>0</td>
<td>String does not fulfill the requirement for a score of 1.</td>
</tr>
</tbody>
</table>

This section evaluates the relevance of the string to the specific community that it claims to represent.

**Criterion 2 Definitions**

- "Name" of the community means the established name by which the community is commonly known by others. It may be, but does not need to be, the name of an organization dedicated to the community.

- "Identify" means that the applied for string closely describes the community or the community members, without over-reaching substantially beyond the community.

**Criterion 2 Guidelines**

With respect to “Nexus,” for a score of 3, the essential aspect is that the applied-for string is commonly known by others as the identification / name of the community.

With respect to “Nexus,” for a score of 2, the applied-for string should closely describe the community or the community members, without over-reaching substantially beyond the community. As an example, a string could qualify for a score of 2 if it is a noun that the typical community member would naturally be called in the context. If the string appears excessively broad (such as, for example, a globally well-known but local tennis club applying for “.TENNIS”) then it would not qualify for a 2.
With respect to “Uniqueness,” a significant meaning relates to the public in general, with consideration of the community language context added.

"Uniqueness" will be scored both with regard to the community context and from a general point of view. For example, a string for a particular geographic location community may seem unique from a general perspective, but would not score a 1 for uniqueness if it carries another significant meaning in the common language used in the relevant community location. The phrasing "...beyond identifying the community" in the score of 1 for "uniqueness" implies a requirement that the string does identify the community, i.e., scores 2 or 3 for "Nexus," in order to be eligible for a score of 1 for "Uniqueness."

It should be noted that "Uniqueness" is only about the meaning of the string - since the evaluation takes place to resolve contention there will obviously be other applications, community-based and/or standard, with identical or confusingly similar strings in the contention set to resolve, so the string will clearly not be "unique" in the sense of "alone.”

**Criterion #3: Registration Policies (0-4 points)**

A maximum of 4 points is possible on the Registration Policies criterion:

```
<table>
<thead>
<tr>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Registration Policies</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

As measured by:

A. **Eligibility (1)**

```
<table>
<thead>
<tr>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Eligibility restricted to community members.</td>
<td>Largely unrestricted approach to eligibility.</td>
</tr>
</tbody>
</table>
```
This section evaluates the applicant’s registration policies as indicated in the application. Registration policies are the conditions that the future registry will set for prospective registrants, i.e. those desiring to register second-level domain names under the registry.

### B. Name selection (1)

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

- Policies include name selection rules consistent with the articulated community-based purpose of the applied-for gTLD. Policies do not fulfill the requirements for a score of 1.

### C. Content and use (1)

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

- Policies include rules for content and use consistent with the articulated community-based purpose of the applied-for gTLD. Policies do not fulfill the requirements for a score of 1.

### D. Enforcement (1)

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

- Policies include specific enforcement measures (e.g. investigation practices, penalties, takedown procedures) constituting a coherent set with appropriate appeal mechanisms. Policies do not fulfill the requirements for a score of 1.
Criterion 3 Definitions

- "Eligibility" means the qualifications that entities or individuals must have in order to be allowed as registrants by the registry.

- "Name selection" means the conditions that must be fulfilled for any second-level domain name to be deemed acceptable by the registry.

- "Content and use" means the restrictions stipulated by the registry as to the content provided in and the use of any second-level domain name in the registry.

- "Enforcement" means the tools and provisions set out by the registry to prevent and remedy any breaches of the conditions by registrants.

Criterion 3 Guidelines

With respect to "Eligibility," the limitation to community "members" can invoke a formal membership but can also be satisfied in other ways, depending on the structure and orientation of the community at hand. For example, for a geographic location community TLD, a limitation to members of the community can be achieved by requiring that the registrant’s physical address is within the boundaries of the location.

With respect to "Name selection," "Content and use," and "Enforcement," scoring of applications against these sub-criteria will be done from a holistic perspective, with due regard for the particularities of the community explicitly addressed. For example, an application proposing a TLD for a language community may feature strict rules imposing this language for name selection as well as for content and use, scoring 1 on both B and C above. It could nevertheless include forbearance in the enforcement measures for tutorial sites assisting those wishing to learn the language and still score 1 on D. More restrictions do not automatically result in a higher score. The restrictions and corresponding enforcement mechanisms proposed by the applicant should show an alignment with the community-based purpose of the TLD and demonstrate continuing accountability to the community named in the application.
Criterion #4: Community Endorsement (0-4 points)

<table>
<thead>
<tr>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community Endorsement</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As measured by:

A. **Support (2)**

<table>
<thead>
<tr>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicant is, or has documented support from, the recognized community institution(s)/member organization(s) or has otherwise documented authority to represent the community.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Documented support from at least one group with relevance, but insufficient support for a score of 1.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Insufficient proof of support for a score of 1.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

B. **Opposition (2)**

<table>
<thead>
<tr>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>No opposition of relevance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Relevant opposition from one group of non-negligible size.</td>
<td></td>

This section evaluates community support and/or opposition to the application. Support and opposition will be scored in relation to the communities explicitly addressed as stated in the application, with due regard for the communities implicitly addressed by the string.

**Criterion 4 Definitions**

- "Recognized" means the institution(s)/organization(s) that, through membership or otherwise, are clearly recognized by
the community members as representative of the community.

- "Relevance" and "relevant" refer to the communities explicitly and implicitly addressed. This means that opposition from communities not identified in the application but with an association to the applied-for string would be considered relevant.

**Criterion 4 Guidelines**

With respect to "Support," it follows that documented support from, for example, the only national association relevant to a particular community on a national level would score a 2 if the string is clearly oriented to that national level, but only a 1 if the string implicitly addresses similar communities in other nations.

Also with respect to "Support," the plurals in brackets for a score of 2, relate to cases of multiple institutions/organizations. In such cases there must be documented support from institutions/organizations representing a majority of the overall community addressed in order to score 2.

The applicant will score a 1 for "Support" if it does not have support from the majority of the recognized community institutions/member organizations, or does not provide full documentation that it has authority to represent the community with its application. A 0 will be scored on "Support" if the applicant fails to provide documentation showing support from recognized community institutions/community member organizations, or does not provide documentation showing that it has the authority to represent the community. It should be noted, however, that documented support from groups or communities that may be seen as implicitly addressed but have completely different orientations compared to the applicant community will not be required for a score of 2 regarding support.

To be taken into account as relevant support, such documentation must contain a description of the process and rationale used in arriving at the expression of support. Consideration of support is not based merely on the number of comments or expressions of support received.

When scoring "Opposition," previous objections to the application as well as public comments during the same application round will be taken into account and assessed.
in this context. There will be no presumption that such objections or comments would prevent a score of 2 or lead to any particular score for “Opposition.” To be taken into account as relevant opposition, such objections or comments must be of a reasoned nature. Sources of opposition that are clearly spurious, unsubstantiated, made for a purpose incompatible with competition objectives, or filed for the purpose of obstruction will not be considered relevant.

4.3 Auction: Mechanism of Last Resort

It is expected that most cases of contention will be resolved by the community priority evaluation, or through voluntary agreement among the involved applicants. Auction is a tie-breaker method for resolving string contention among the applications within a contention set, if the contention has not been resolved by other means.

An auction will not take place to resolve contention in the case where the contending applications are for geographic names (as defined in Module 2). In this case, the applications will be suspended pending resolution by the applicants.

An auction will take place, where contention has not already been resolved, in the case where an application for a geographic name is in a contention set with applications for similar strings that have not been identified as geographic names.

In practice, ICANN expects that most contention cases will be resolved through other means before reaching the auction stage. However, there is a possibility that significant funding will accrue to ICANN as a result of one or more auctions.¹

¹ The purpose of an auction is to resolve contention in a clear, objective manner. It is planned that costs of the new gTLD program will offset by fees, so any funds coming from a last resort contention resolution mechanism such as auctions would result (after paying for the auction process) in additional funding. Any proceeds from auctions will be reserved and earmarked until the uses of funds are determined. Funds must be used in a manner that supports directly ICANN’s Mission and Core Values and also allows ICANN to maintain its not for profit status.

Possible uses of auction funds include formation of a foundation with a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community, such as grants to support new gTLD applications or registry operators from communities in subsequent gTLD rounds, the creation of an ICANN-administered/community-based fund for specific projects for the benefit of the Internet community, the creation of a registry continuity fund for the protection of registrants (ensuring that funds would be in place to support the operation of a gTLD registry until a successor could be found), or establishment of a security fund to expand use of secure protocols, conduct research, and support standards development organizations in accordance with ICANN’s security and stability mission.
4.3.1 Auction Procedures

An auction of two or more applications within a contention set is conducted as follows. The auctioneer successively increases the prices associated with applications within the contention set, and the respective applicants indicate their willingness to pay these prices. As the prices rise, applicants will successively choose to exit from the auction. When a sufficient number of applications have been eliminated so that no direct contentions remain (i.e., the remaining applications are no longer in contention with one another and all the relevant strings can be delegated as TLDs), the auction will be deemed to conclude. At the auction’s conclusion, the applicants with remaining applications will pay the resulting prices and proceed toward delegation. This procedure is referred to as an “ascending-clock auction.”

This section provides applicants an informal introduction to the practicalities of participation in an ascending-clock auction. It is intended only as a general introduction and is only preliminary. The detailed set of Auction Rules will be available prior to the commencement of any auction proceedings. If any conflict arises between this module and the auction rules, the auction rules will prevail.

For simplicity, this section will describe the situation where a contention set consists of two or more applications for identical strings.

All auctions will be conducted over the Internet, with participants placing their bids remotely using a web-based software system designed especially for auction. The auction software system will be compatible with current versions of most prevalent browsers, and will not require the local installation of any additional software.

Auction participants (“bidders”) will receive instructions for access to the online auction site. Access to the site will be password-protected and bids will be encrypted through SSL. If a bidder temporarily loses connection to the Internet, that bidder may be permitted to submit its bids in a given auction round by fax, according to procedures described.
in the auction rules. The auctions will generally be conducted to conclude quickly, ideally in a single day.

The auction will be carried out in a series of auction rounds, as illustrated in Figure 4-3. The sequence of events is as follows:

1. For each auction round, the auctioneer will announce in advance: (1) the start-of-round price, (2) the end-of-round price, and (3) the starting and ending times of the auction round. In the first auction round, the start-of-round price for all bidders in the auction will be USD 0. In later auction rounds, the start-of-round price will be its end-of-round price from the previous auction round.

2. During each auction round, bidders will be required to submit a bid or bids representing their willingness to pay within the range of intermediate prices between the start-of-round and end-of-round prices. In this way a bidder indicates its willingness to stay in the auction at all prices through and including the end-of-auction round price, or its wish to exit the auction at a price less than the end-of-auction round price, called the exit bid.

3. Exit is irrevocable. If a bidder exited the auction in a previous auction round, the bidder is not permitted to re-enter in the current auction round.
4. Bidders may submit their bid or bids at any time during the auction round.

5. Only bids that comply with all aspects of the auction rules will be considered valid. If more than one valid bid is submitted by a given bidder within the time limit of the auction round, the auctioneer will treat the last valid submitted bid as the actual bid.

6. At the end of each auction round, bids become the bidders' legally-binding offers to secure the relevant gTLD strings at prices up to the respective bid amounts, subject to closure of the auction in accordance with the auction rules. In later auction rounds, bids may be used to exit from the auction at subsequent higher prices.

7. After each auction round, the auctioneer will disclose the aggregate number of bidders remaining in the auction at the end-of-round prices for the auction round, and will announce the prices and times for the next auction round.

   • Each bid should consist of a single price associated with the application, and such price must be greater than or equal to the start-of-round price.

   • If the bid amount is strictly less than the end-of-round price, then the bid is treated as an exit bid at the specified amount, and it signifies the bidder's binding commitment to pay up to the bid amount if its application is approved.

   • If the bid amount is greater than or equal to the end-of-round price, then the bid signifies that the bidder wishes to remain in the auction at all prices in the current auction round, and it signifies the bidder's binding commitment to pay up to the end-of-round price if its application is approved. Following such bid, the application cannot be eliminated within the current auction round.

   • To the extent that the bid amount exceeds the end-of-round price, then the bid is also treated as a proxy bid to be carried forward to the next auction round. The bidder will be permitted to change the proxy bid amount in the next auction round, and the amount of the proxy bid will not constrain the bidder's ability to submit any valid bid amount in the next auction round.
• No bidder is permitted to submit a bid for any application for which an exit bid was received in a prior auction round. That is, once an application has exited the auction, it may not return.

• If no valid bid is submitted within a given auction round for an application that remains in the auction, then the bid amount is taken to be the amount of the proxy bid, if any, carried forward from the previous auction round or, if none, the bid is taken to be an exit bid at the start-of-round price for the current auction round.

8. This process continues, with the auctioneer increasing the price range for each given TLD string in each auction round, until there is one remaining bidder at the end-of-round price. After an auction round in which this condition is satisfied, the auction concludes and the auctioneer determines the clearing price. The last remaining application is deemed the successful application, and the associated bidder is obligated to pay the clearing price.

Figure 4-4 illustrates how an auction for five contending applications might progress.

Figure 4-4 – Example of an auction for five mutually-contending applications.
• Before the first auction round, the auctioneer announces the end-of-round price $P_1$.

• During Auction round 1, a bid is submitted for each application. In Figure 4-4, all five bidders submit bids of at least $P_1$. Since the aggregate demand exceeds one, the auction proceeds to Auction round 2. The auctioneer discloses that five contending applications remained at $P_1$ and announces the end-of-round price $P_2$.

• During Auction round 2, a bid is submitted for each application. In Figure 4-4, all five bidders submit bids of at least $P_2$. The auctioneer discloses that five contending applications remained at $P_2$ and announces the end-of-round price $P_3$.

• During Auction round 3, one of the bidders submits an exit bid at slightly below $P_3$, while the other four bidders submit bids of at least $P_3$. The auctioneer discloses that four contending applications remained at $P_3$ and announces the end-of-round price $P_4$.

• During Auction round 4, one of the bidders submits an exit bid midway between $P_3$ and $P_4$, while the other three remaining bidders submit bids of at least $P_4$. The auctioneer discloses that three contending applications remained at $P_4$ and announces the end-of-auction round price $P_5$.

• During Auction round 5, one of the bidders submits an exit bid at slightly above $P_4$, and one of the bidders submits an exit bid at $P_c$ midway between $P_4$ and $P_5$. The final bidder submits a bid greater than $P_c$. Since the aggregate demand at $P_5$ does not exceed one, the auction concludes in Auction round 5. The application associated with the highest bid in Auction round 5 is deemed the successful application. The clearing price is $P_c$, as this is the lowest price at which aggregate demand can be met.

To the extent possible, auctions to resolve multiple string contention situations will be conducted simultaneously.

4.3.1.1 Currency

For bids to be comparable, all bids in the auction will be submitted in any integer (whole) number of US dollars.
4.3.1.2 Fees

A bidding deposit will be required of applicants participating in the auction, in an amount to be determined. The bidding deposit must be transmitted by wire transfer to a specified bank account specified by ICANN or its auction provider at a major international bank, to be received in advance of the auction date. The amount of the deposit will determine a bidding limit for each bidder: the bidding deposit will equal 10% of the bidding limit; and the bidder will not be permitted to submit any bid in excess of its bidding limit.

In order to avoid the need for bidders to pre-commit to a particular bidding limit, bidders may be given the option of making a specified deposit that will provide them with unlimited bidding authority for a given application. The amount of the deposit required for unlimited bidding authority will depend on the particular contention set and will be based on an assessment of the possible final prices within the auction.

All deposits from non-defaulting losing bidders will be returned following the close of the auction.

4.3.2 Winning Bid Payments

Any applicant that participates in an auction will be required to sign a bidder agreement that acknowledges its rights and responsibilities in the auction, including that its bids are legally binding commitments to pay the amount bid if it wins (i.e., if its application is approved), and to enter into the prescribed registry agreement with ICANN—together with a specified penalty for defaulting on payment of its winning bid or failing to enter into the required registry agreement.

The winning bidder in any auction will be required to pay the full amount of the final price within 20 business days of the end of the auction. Payment is to be made by wire transfer to the same international bank account as the bidding deposit, and the applicant's bidding deposit will be credited toward the final price.

In the event that a bidder anticipates that it would require a longer payment period than 20 business days due to verifiable government-imposed currency restrictions, the bidder may advise ICANN well in advance of the auction and ICANN will consider applying a longer payment period to all bidders within the same contention set.
Any winning bidder for whom the full amount of the final price is not received within 20 business days of the end of an auction is subject to being declared in default. At their sole discretion, ICANN and its auction provider may delay the declaration of default for a brief period, but only if they are convinced that receipt of full payment is imminent.

Any winning bidder for whom the full amount of the final price is received within 20 business days of the end of an auction retains the obligation to execute the required registry agreement within 90 days of the end of auction. Such winning bidder who does not execute the agreement within 90 days of the end of the auction is subject to being declared in default. At their sole discretion, ICANN and its auction provider may delay the declaration of default for a brief period, but only if they are convinced that execution of the registry agreement is imminent.

4.3.3 Post-Default Procedures

Once declared in default, any winning bidder is subject to immediate forfeiture of its position in the auction and assessment of default penalties. After a winning bidder is declared in default, the remaining bidders will receive an offer to have their applications accepted, one at a time, in descending order of their exit bids. In this way, the next bidder would be declared the winner subject to payment of its last bid price. The same default procedures and penalties are in place for any runner-up bidder receiving such an offer.

Each bidder that is offered the relevant gTLD will be given a specified period—typically, four business days—to respond as to whether it wants the gTLD. A bidder who responds in the affirmative will have 20 business days to submit its full payment. A bidder who declines such an offer cannot revert on that statement, has no further obligations in this context and will not be considered in default.

The penalty for defaulting on a winning bid will equal 10% of the defaulting bid. Default penalties will be charged against any defaulting applicant’s bidding deposit before the associated bidding deposit is returned.

---

2 If bidders were given the option of making a specified deposit that provided them with unlimited bidding authority for a given application and if the winning bidder utilized this option, then the penalty for defaulting on a winning bid will be the lesser of the following: (1) 10% of the defaulting bid, or (2) the specified deposit amount that provided the bidder with unlimited bidding authority.
4.4 Contention Resolution and Contract Execution

An applicant that has been declared the winner of a contention resolution process will proceed by entering into the contract execution step. (Refer to section 5.1 of Module 5.)

If a winner of the contention resolution procedure has not executed a contract within 90 calendar days of the decision, ICANN has the right to deny that application and extend an offer to the runner-up applicant, if any, to proceed with its application. For example, in an auction, another applicant who would be considered the runner-up applicant might proceed toward delegation. This offer is at ICANN’s option only. The runner-up applicant in a contention resolution process has no automatic right to an applied-for gTLD string if the first place winner does not execute a contract within a specified time. If the winning applicant can demonstrate that it is working diligently and in good faith toward successful completion of the steps necessary for entry into the registry agreement, ICANN may extend the 90-day period at its discretion. Runner-up applicants have no claim of priority over the winning application, even after what might be an extended period of negotiation.
DRAFT - New gTLD Program - String Contention

Application/ Admin Check:
- Applicant begins application process.
- Applicant elects whether to designate application as community-based.
- Applicant submits application in TLD Application System (TAS).
- ICANN publishes list of all complete applications.

Initial Evaluation (IE) String Review:
- ICANN runs algorithm for all applied-for gTLDs against all other applied-for gTLDs.
- String Similarity Panel performs analysis, using algorithm results, to group similar and identical strings into contention sets.
- ICANN communicates the results of the String Similarity review, including contention sets.

IE + EE + Dispute Res + String Contention:
- IE, Extended Evaluation (EE), and Dispute Resolution continue. Some applications may not pass certain elements of the review process, which may alter the contention sets.

String Contention:
- Is the applied-for gTLD in a contention set?
  - Yes: Have one or more community-based applicant(s) elected community priority?
    - Yes: Community priority evaluation
    - No: Applicants are encouraged to self-resolve string contention anytime prior to the contention resolution process.
  - No: Applicants with contending strings participate in auction. One or more parties proceed to subsequent stage

Transition to Delegation:
- Applicant enters Transition to Delegation phase

Does one clear winner emerge?
- Yes
- No
gTLD Applicant Guidebook
(v. 2012-01-11)
Module 5

11 January 2012
Module 5
Transition to Delegation

This module describes the final steps required of an applicant for completion of the process, including execution of a registry agreement with ICANN and preparing for delegation of the new gTLD into the root zone.

5.1 Registry Agreement

All applicants that have successfully completed the evaluation process—including, if necessary, the dispute resolution and string contention processes—are required to enter into a registry agreement with ICANN before proceeding to delegation.

After the close of each stage in the process, ICANN will send a notification to those successful applicants that are eligible for execution of a registry agreement at that time.

To proceed, applicants will be asked to provide specified information for purposes of executing the registry agreement:

1. Documentation of the applicant’s continued operations instrument (see Specification 8 to the agreement).

2. Confirmation of contact information and signatory to the agreement.

3. Notice of any material changes requested to the terms of the agreement.

4. The applicant must report: (i) any ownership interest it holds in any registrar or reseller of registered names, (ii) if known, any ownership interest that a registrar or reseller of registered names holds in the applicant, and (iii) if the applicant controls, is controlled by, or is under common control with any registrar or reseller of registered names. ICANN retains the right to refer an application to a competition authority prior to entry into the registry agreement if it is determined that the registry-registrar cross-ownership...
arrangements might raise competition issues. For this purpose "control" (including the terms “controlled by” and “under common control with”) means the possession, directly or indirectly, of the power to direct or cause the direction of the management or policies of a person or entity, whether through the ownership of securities, as trustee or executor, by serving as a member of a board of directors or equivalent governing body, by contract, by credit arrangement or otherwise.

To ensure that an applicant continues to be a going concern in good legal standing, ICANN reserves the right to ask the applicant to submit additional updated documentation and information before entering into the registry agreement.

ICANN will begin processing registry agreements one month after the date of the notification to successful applicants. Requests will be handled in the order the complete information is received.

Generally, the process will include formal approval of the agreement without requiring additional Board review, so long as: the application passed all evaluation criteria; there are no material changes in circumstances; and there are no material changes to the base agreement. There may be other cases where the Board requests review of an application.

Eligible applicants are expected to have executed the registry agreement within nine (9) months of the notification date. Failure to do so may result in loss of eligibility, at ICANN’s discretion. An applicant may request an extension of this time period for up to an additional nine (9) months if it can demonstrate, to ICANN’s reasonable satisfaction, that it is working diligently and in good faith toward successfully completing the steps necessary for entry into the registry agreement.

The registry agreement can be reviewed in the attachment to this module. Certain provisions in the agreement are labeled as applicable to governmental and intergovernmental entities only. Private entities, even if supported by a government or IGO, would not ordinarily be eligible for these special provisions.

All successful applicants are expected to enter into the agreement substantially as written. Applicants may request and negotiate terms by exception; however, this extends
the time involved in executing the agreement. In the event that material changes to the agreement are requested, these must first be approved by the ICANN Board of Directors before execution of the agreement.

ICANN’s Board of Directors has ultimate responsibility for the New gTLD Program. The Board reserves the right to individually consider an application for a new gTLD to determine whether approval would be in the best interest of the Internet community. Under exceptional circumstances, the Board may individually consider a gTLD application. For example, the Board might individually consider an application as a result of GAC Advice on New gTLDs or of the use of an ICANN accountability mechanism.

5.2 Pre-Delegation Testing

Each applicant will be required to complete pre-delegation technical testing as a prerequisite to delegation into the root zone. This pre-delegation test must be completed within the time period specified in the registry agreement.

The purpose of the pre-delegation technical test is to verify that the applicant has met its commitment to establish registry operations in accordance with the technical and operational criteria described in Module 2.

The test is also intended to indicate that the applicant can operate the gTLD in a stable and secure manner. All applicants will be tested on a pass/fail basis according to the requirements that follow.

The test elements cover both the DNS server operational infrastructure and registry system operations. In many cases the applicant will perform the test elements as instructed and provide documentation of the results to ICANN to demonstrate satisfactory performance. At ICANN’s discretion, aspects of the applicant’s self-certification documentation can be audited either on-site at the services delivery point of the registry or elsewhere as determined by ICANN.

5.2.1 Testing Procedures

The applicant may initiate the pre-delegation test by submitting to ICANN the Pre-Delegation form and accompanying documents containing all of the following information:
• All name server names and IPv4/IPv6 addresses to be used in serving the new TLD data;

• If using anycast, the list of names and IPv4/IPv6 unicast addresses allowing the identification of each individual server in the anycast sets;

• If IDN is supported, the complete IDN tables used in the registry system;

• A test zone for the new TLD must be signed at test time and the valid key-set to be used at the time of testing must be provided to ICANN in the documentation, as well as the TLD DNSSEC Policy Statement (DPS);

• The executed agreement between the selected escrow agent and the applicant; and

• Self-certification documentation as described below for each test item.

ICANN will review the material submitted and in some cases perform tests in addition to those conducted by the applicant. After testing, ICANN will assemble a report with the outcome of the tests and provide that report to the applicant.

Any clarification request, additional information request, or other request generated in the process will be highlighted and listed in the report sent to the applicant.

ICANN may request the applicant to complete load tests considering an aggregated load where a single entity is performing registry services for multiple TLDs.

Once an applicant has met all of the pre-delegation testing requirements, it is eligible to request delegation of its applied-for gTLD.

If an applicant does not complete the pre-delegation steps within the time period specified in the registry agreement, ICANN reserves the right to terminate the registry agreement.
5.2.2 Test Elements: DNS Infrastructure

The first set of test elements concerns the DNS infrastructure of the new gTLD. In all tests of the DNS infrastructure, all requirements are independent of whether IPv4 or IPv6 is used. All tests shall be done both over IPv4 and IPv6, with reports providing results according to both protocols.

**UDP Support** -- The DNS infrastructure to which these tests apply comprises the complete set of servers and network infrastructure to be used by the chosen providers to deliver DNS service for the new gTLD to the Internet. The documentation provided by the applicant must include the results from a system performance test indicating available network and server capacity and an estimate of expected capacity during normal operation to ensure stable service as well as to adequately address Distributed Denial of Service (DDoS) attacks.

Self-certification documentation shall include data on load capacity, latency and network reachability.

Load capacity shall be reported using a table, and a corresponding graph, showing percentage of queries responded against an increasing number of queries per second generated from local (to the servers) traffic generators. The table shall include at least 20 data points and loads of UDP-based queries that will cause up to 10% query loss against a randomly selected subset of servers within the applicant’s DNS infrastructure. Responses must either contain zone data or be NXDOMAIN or NODATA responses to be considered valid.

Query latency shall be reported in milliseconds as measured by DNS probes located just outside the border routers of the physical network hosting the name servers, from a network topology point of view.

Reachability will be documented by providing information on the transit and peering arrangements for the DNS server locations, listing the AS numbers of the transit providers or peers at each point of presence and available bandwidth at those points of presence.

**TCP support** -- TCP transport service for DNS queries and responses must be enabled and provisioned for expected load. ICANN will review the capacity self-certification documentation provided by the applicant and will perform TCP reachability and transaction capability tests across a
randomly selected subset of the name servers within the applicant's DNS infrastructure. In case of use of anycast, each individual server in each anycast set will be tested.

Self-certification documentation shall include data on load capacity, latency and external network reachability.

Load capacity shall be reported using a table, and a corresponding graph, showing percentage of queries that generated a valid (zone data, NO DATA, or NXDOMAIN) response against an increasing number of queries per second generated from local (to the name servers) traffic generators. The table shall include at least 20 data points and loads that will cause up to 10% query loss (either due to connection timeout or connection reset) against a randomly selected subset of servers within the applicant's DNS infrastructure.

Query latency will be reported in milliseconds as measured by DNS probes located just outside the border routers of the physical network hosting the name servers, from a network topology point of view.

Reachability will be documented by providing records of TCP-based DNS queries from nodes external to the network hosting the servers. These locations may be the same as those used for measuring latency above.

**DNSSEC support** -- Applicant must demonstrate support for EDNS(0) in its server infrastructure, the ability to return correct DNSSEC-related resource records such as DNSKEY, RRSIG, and NSEC/NSEC3 for the signed zone, and the ability to accept and publish DS resource records from second-level domain administrators. In particular, the applicant must demonstrate its ability to support the full life cycle of KSK and ZSK keys. ICANN will review the self-certification materials as well as test the reachability, response sizes, and DNS transaction capacity for DNS queries using the EDNS(0) protocol extension with the "DNSSEC OK" bit set for a randomly selected subset of all name servers within the applicant’s DNS infrastructure. In case of use of anycast, each individual server in each anycast set will be tested.

Load capacity, query latency, and reachability shall be documented as for UDP and TCP above.
5.2.3 Test Elements: Registry Systems

As documented in the registry agreement, registries must provide support for EPP within their Shared Registration System, and provide Whois service both via port 43 and a web interface, in addition to support for the DNS. This section details the requirements for testing these registry systems.

**System performance** -- The registry system must scale to meet the performance requirements described in Specification 10 of the registry agreement and ICANN will require self-certification of compliance. ICANN will review the self-certification documentation provided by the applicant to verify adherence to these minimum requirements.

**Whois support** -- Applicant must provision Whois services for the anticipated load. ICANN will verify that Whois data is accessible over IPv4 and IPv6 via both TCP port 43 and via a web interface and review self-certification documentation regarding Whois transaction capacity. Response format according to Specification 4 of the registry agreement and access to Whois (both port 43 and via web) will be tested by ICANN remotely from various points on the Internet over both IPv4 and IPv6.

Self-certification documents shall describe the maximum number of queries per second successfully handled by both the port 43 servers as well as the web interface, together with an applicant-provided load expectation.

Additionally, a description of deployed control functions to detect and mitigate data mining of the Whois database shall be documented.

**EPP Support** -- As part of a shared registration service, applicant must provision EPP services for the anticipated load. ICANN will verify conformance to appropriate RFCs (including EPP extensions for DNSSEC). ICANN will also review self-certification documentation regarding EPP transaction capacity.

Documentation shall provide a maximum Transaction per Second rate for the EPP interface with 10 data points corresponding to registry database sizes from 0 (empty) to the expected size after one year of operation, as determined by applicant.
Documentation shall also describe measures taken to handle load during initial registry operations, such as a land-rush period.

**IPv6 support** -- The ability of the registry to support registrars adding, changing, and removing IPv6 DNS records supplied by registrants will be tested by ICANN. If the registry supports EPP access via IPv6, this will be tested by ICANN remotely from various points on the Internet.

**DNSSEC support** -- ICANN will review the ability of the registry to support registrars adding, changing, and removing DNSSEC-related resource records as well as the registry’s overall key management procedures. In particular, the applicant must demonstrate its ability to support the full life cycle of key changes for child domains. Inter-operation of the applicant’s secure communication channels with the IANA for trust anchor material exchange will be verified.

The practice and policy document (also known as the DNSSEC Policy Statement or DPS), describing key material storage, access and usage for its own keys is also reviewed as part of this step.

**IDN support** -- ICANN will verify the complete IDN table(s) used in the registry system. The table(s) must comply with the guidelines in [http://iana.org/procedures/idn-repository.html](http://iana.org/procedures/idn-repository.html).

Requirements related to IDN for Whois are being developed. After these requirements are developed, prospective registries will be expected to comply with published IDN-related Whois requirements as part of pre-delegation testing.

**Escrow deposit** -- The applicant-provided samples of data deposit that include both a full and an incremental deposit showing correct type and formatting of content will be reviewed. Special attention will be given to the agreement with the escrow provider to ensure that escrowed data can be released within 24 hours should it be necessary. ICANN may, at its option, ask an independent third party to demonstrate the reconstitutability of the registry from escrowed data. ICANN may elect to test the data release process with the escrow agent.
5.3 Delegation Process

Upon notice of successful completion of the ICANN pre-delegation testing, applicants may initiate the process for delegation of the new gTLD into the root zone database. This will include provision of additional information and completion of additional technical steps required for delegation. Information about the delegation process is available at http://iana.org/domains/root/.

5.4 Ongoing Operations

An applicant that is successfully delegated a gTLD will become a “Registry Operator.” In being delegated the role of operating part of the Internet’s domain name system, the applicant will be assuming a number of significant responsibilities. ICANN will hold all new gTLD operators accountable for the performance of their obligations under the registry agreement, and it is important that all applicants understand these responsibilities.

5.4.1 What is Expected of a Registry Operator

The registry agreement defines the obligations of gTLD registry operators. A breach of the registry operator’s obligations may result in ICANN compliance actions up to and including termination of the registry agreement. Prospective applicants are encouraged to review the following brief description of some of these responsibilities.

Note that this is a non-exhaustive list provided to potential applicants as an introduction to the responsibilities of a registry operator. For the complete and authoritative text, please refer to the registry agreement.

A registry operator is obligated to:

- Operate the TLD in a stable and secure manner. The registry operator is responsible for the entire technical operation of the TLD. As noted in RFC 1591:

  “The designated manager must do a satisfactory job of operating the DNS service for the domain. That is, the actual management of the assigning of domain names, delegating subdomains and operating nameservers must be done with technical competence. This includes keeping

1 See http://www.rfc-editor.org/rfc/rfc1591.txt
the central IR\(^2\) (in the case of top-level domains) or other higher-level domain manager advised of the status of the domain, responding to requests in a timely manner, and operating the database with accuracy, robustness, and resilience."

The registry operator is required to comply with relevant technical standards in the form of RFCs and other guidelines. Additionally, the registry operator must meet performance specifications in areas such as system downtime and system response times (see Specifications 6 and 10 of the registry agreement).

**Comply with consensus policies and temporary policies.**

gTLD registry operators are required to comply with consensus policies. Consensus policies may relate to a range of topics such as issues affecting interoperability of the DNS, registry functional and performance specifications, database security and stability, or resolution of disputes over registration of domain names.

To be adopted as a consensus policy, a policy must be developed by the Generic Names Supporting Organization (GNSO)\(^3\) following the process in Annex A of the ICANN Bylaws.\(^4\) The policy development process involves deliberation and collaboration by the various stakeholder groups participating in the process, with multiple opportunities for input and comment by the public, and can take significant time.

Examples of existing consensus policies are the Inter-Registrar Transfer Policy (governing transfers of domain names between registrars), and the Registry Services Evaluation Policy (establishing a review of proposed new registry services for security and stability or competition concerns), although there are several more, as found at [http://www.icann.org/en/general/consensus-policies.htm](http://www.icann.org/en/general/consensus-policies.htm).

gTLD registry operators are obligated to comply with both existing consensus policies and those that are developed in the future. Once a consensus policy has been formally adopted, ICANN will provide gTLD registry operators with notice of the requirement to implement the new policy and the effective date.

---

\(^2\) IR is a historical reference to “Internet Registry,” a function now performed by ICANN.

\(^3\) [http://gnso.icann.org](http://gnso.icann.org)

In addition, the ICANN Board may, when required by circumstances, establish a temporary policy necessary to maintain the stability or security of registry services or the DNS. In such a case, all gTLD registry operators will be required to comply with the temporary policy for the designated period of time.

For more information, see Specification 1 of the registry agreement.

**Implement start-up rights protection measures.** The registry operator must implement, at a minimum, a Sunrise period and a Trademark Claims service during the start-up phases for registration in the TLD, as provided in the registry agreement. These mechanisms will be supported by the established Trademark Clearinghouse as indicated by ICANN.

The Sunrise period allows eligible rightsholders an early opportunity to register names in the TLD.

The Trademark Claims service provides notice to potential registrants of existing trademark rights, as well as notice to rightsholders of relevant names registered. Registry operators may continue offering the Trademark Claims service after the relevant start-up phases have concluded.

For more information, see Specification 7 of the registry agreement and the Trademark Clearinghouse model accompanying this module.

**Implement post-launch rights protection measures.** The registry operator is required to implement decisions made under the Uniform Rapid Suspension (URS) procedure, including suspension of specific domain names within the registry. The registry operator is also required to comply with and implement decisions made according to the Trademark Post-Delegation Dispute Resolution Policy (PDDRP).

The required measures are described fully in the URS and PDDRP procedures accompanying this module. Registry operators may introduce additional rights protection measures relevant to the particular gTLD.

**Implement measures for protection of country and territory names in the new gTLD.** All new gTLD registry operators are required to provide certain minimum protections for country and territory names, including an initial reservation requirement and establishment of applicable rules and
procedures for release of these names. The rules for release can be developed or agreed to by governments, the GAC, and/or approved by ICANN after a community discussion. Registry operators are encouraged to implement measures for protection of geographical names in addition to those required by the agreement, according to the needs and interests of each gTLD's particular circumstances. (See Specification 5 of the registry agreement).

Pay recurring fees to ICANN. In addition to supporting expenditures made to accomplish the objectives set out in ICANN’s mission statement, these funds enable the support required for new gTLDs, including: contractual compliance, registry liaison, increased registrar accreditations, and other registry support activities. The fees include both a fixed component (USD 25,000 annually) and, where the TLD exceeds a transaction volume, a variable fee based on transaction volume. See Article 6 of the registry agreement.

Regularly deposit data into escrow. This serves an important role in registrant protection and continuity for certain instances where the registry or one aspect of the registry operations experiences a system failure or loss of data. (See Specification 2 of the registry agreement.)

Deliver monthly reports in a timely manner. A registry operator must submit a report to ICANN on a monthly basis. The report includes registrar transactions for the month and is used by ICANN for calculation of registrar fees. (See Specification 3 of the registry agreement.)

Provide Whois service. A registry operator must provide a publicly available Whois service for registered domain names in the TLD. (See Specification 4 of the registry agreement.)

Maintain partnerships with ICANN-accredited registrars. A registry operator creates a Registry-Registrar Agreement (RRA) to define requirements for its registrars. This must include certain terms that are specified in the Registry Agreement, and may include additional terms specific to the TLD. A registry operator must provide non-discriminatory access to its registry services to all ICANN-accredited registrars with whom it has entered into an RRA, and who are in compliance with the requirements. This includes providing advance notice of pricing changes to all
registrars, in compliance with the time frames specified in the agreement. (See Article 2 of the registry agreement.)

**Maintain an abuse point of contact.** A registry operator must maintain and publish on its website a single point of contact responsible for addressing matters requiring expedited attention and providing a timely response to abuse complaints concerning all names registered in the TLD through all registrars of record, including those involving a reseller. A registry operator must also take reasonable steps to investigate and respond to any reports from law enforcement, governmental and quasi-governmental agencies of illegal conduct in connection with the use of the TLD. (See Article 2 and Specification 6 of the registry agreement.)

**Cooperate with contractual compliance audits.** To maintain a level playing field and a consistent operating environment, ICANN staff performs periodic audits to assess contractual compliance and address any resulting problems. A registry operator must provide documents and information requested by ICANN that are necessary to perform such audits. (See Article 2 of the registry agreement.)

**Maintain a Continued Operations Instrument.** A registry operator must, at the time of the agreement, have in place a continued operations instrument sufficient to fund basic registry operations for a period of three (3) years. This requirement remains in place for five (5) years after delegation of the TLD, after which time the registry operator is no longer required to maintain the continued operations instrument. (See Specification 8 to the registry agreement.)

**Maintain community-based policies and procedures.** If the registry operator designated its application as community-based at the time of the application, the registry operator has requirements in its registry agreement to maintain the community-based policies and procedures it specified in its application. The registry operator is bound by the Registry Restrictions Dispute Resolution Procedure with respect to disputes regarding execution of its community-based policies and procedures. (See Article 2 to the registry agreement.)

**Have continuity and transition plans in place.** This includes performing failover testing on a regular basis. In the event that a transition to a new registry operator becomes necessary, the registry operator is expected to cooperate
by consulting with ICANN on the appropriate successor, providing the data required to enable a smooth transition, and complying with the applicable registry transition procedures. (See Articles 2 and 4 of the registry agreement.)

**Make TLD zone files available via a standardized process.** This includes provision of access to the registry’s zone file to credentialed users, according to established access, file, and format standards. The registry operator will enter into a standardized form of agreement with zone file users and will accept credential information for users via a clearinghouse. (See Specification 4 of the registry agreement.)

**Implement DNSSEC.** The registry operator is required to sign the TLD zone files implementing Domain Name System Security Extensions (DNSSEC) in accordance with the relevant technical standards. The registry must accept public key material from registrars for domain names registered in the TLD, and publish a DNSSEC Policy Statement describing key material storage, access, and usage for the registry’s keys. (See Specification 6 of the registry agreement.)

### 5.4.2 What is Expected of ICANN

ICANN will continue to provide support for gTLD registry operators as they launch and maintain registry operations. ICANN’s gTLD registry liaison function provides a point of contact for gTLD registry operators for assistance on a continuing basis.

ICANN’s contractual compliance function will perform audits on a regular basis to ensure that gTLD registry operators remain in compliance with agreement obligations, as well as investigate any complaints from the community regarding the registry operator’s adherence to its contractual obligations. See [http://www.icann.org/en/compliance/](http://www.icann.org/en/compliance/) for more information on current contractual compliance activities.

ICANN’s Bylaws require ICANN to act in an open and transparent manner, and to provide equitable treatment among registry operators. ICANN is responsible for maintaining the security and stability of the global Internet, and looks forward to a constructive and cooperative relationship with future gTLD registry operators in furtherance of this goal.
New gTLD Agreement

This document contains the registry agreement associated with the Applicant Guidebook for New gTLDs.

Successful gTLD applicants would enter into this form of registry agreement with ICANN prior to delegation of the new gTLD. (Note: ICANN reserves the right to make reasonable updates and changes to this proposed agreement during the course of the application process, including as the possible result of new policies that might be adopted during the course of the application process).
REGISTRY AGREEMENT

This REGISTRY AGREEMENT (this “Agreement”) is entered into as of ___________ (the “Effective Date”) between Internet Corporation for Assigned Names and Numbers, a California nonprofit public benefit corporation (“ICANN”), and __________, a _____________ (“Registry Operator”).

ARTICLE 1.

OF TOP–LEVEL DOMAIN; REPRESENTATIONS AND WARRANTIES

1.1 Domain and Designation. The Top-Level Domain to which this Agreement applies is ____ (the “TLD”). Upon the Effective Date and until the end of the Term (as defined in Section 4.1), ICANN designates Registry Operator as the registry operator for the TLD, subject to the requirements and necessary approvals for delegation of the TLD and entry into the root-zone.

1.2 Technical Feasibility of String. While ICANN has encouraged and will continue to encourage universal acceptance of all top-level domain strings across the Internet, certain top-level domain strings may encounter difficulty in acceptance by ISPs and webhosters and/or validation by web applications. Registry Operator shall be responsible for ensuring to its satisfaction the technical feasibility of the TLD string prior to entering into this Agreement.

1.3 Representations and Warranties.

(a) Registry Operator represents and warrants to ICANN as follows:

(i) all material information provided and statements made in the registry TLD application, and statements made in writing during the negotiation of this Agreement, were true and correct in all material respects at the time made, and such information or statements continue to be true and correct in all material respects as of the Effective Date except as otherwise previously disclosed in writing by Registry Operator to ICANN;

(ii) Registry Operator is duly organized, validly existing and in good standing under the laws of the jurisdiction set forth in the preamble hereto, and Registry Operator has all requisite power and authority and obtained all necessary approvals to enter into and duly execute and deliver this Agreement; and

(iii) Registry Operator has delivered to ICANN a duly executed instrument that secures the funds required to perform registry functions for the TLD in the event of the termination or expiration of this Agreement (the “Continued Operations Instrument”), and such instrument is a binding obligation of the parties thereto, enforceable against the parties thereto in accordance with its terms.

(b) ICANN represents and warrants to Registry Operator that ICANN is a nonprofit public benefit corporation duly organized, validly existing and in good standing under the laws of the State of California, United States of America. ICANN has all requisite power and authority and obtained all necessary corporate approvals to enter into and duly execute and deliver this Agreement.
ARTICLE 2.

COVENANTS OF REGISTRY OPERATOR

Registry Operator covenants and agrees with ICANN as follows:

2.1 Approved Services; Additional Services. Registry Operator shall be entitled to provide the Registry Services described in clauses (a) and (b) of the first paragraph of Section 2.1 in the specification at [see specification 6] (“Specification 6”) and such other Registry Services set forth on Exhibit A (collectively, the “Approved Services”). If Registry Operator desires to provide any Registry Service that is not an Approved Service or is a modification to an Approved Service (each, an “Additional Service”), Registry Operator shall submit a request for approval of such Additional Service pursuant to the Registry Services Evaluation Policy at http://www.icann.org/en/registries/rsep/rsep.html, as such policy may be amended from time to time in accordance with the bylaws of ICANN (as amended from time to time, the “ICANN Bylaws”) applicable to Consensus Policies (the “RSEP”). Registry Operator may offer Additional Services only with the written approval of ICANN, and, upon any such approval, such Additional Services shall be deemed Registry Services under this Agreement. In its reasonable discretion, ICANN may require an amendment to this Agreement reflecting the provision of any Additional Service which is approved pursuant to the RSEP, which amendment shall be in a form reasonably acceptable to the parties.

2.2 Compliance with Consensus Policies and Temporary Policies. Registry Operator shall comply with and implement all Consensus Policies and Temporary Policies found at <http://www.icann.org/general/consensus-policies.htm>, as of the Effective Date and as may in the future be developed and adopted in accordance with the ICANN Bylaws, provided such future Consensus Policies and Temporary Policies are adopted in accordance with the procedure and relate to those topics and subject to those limitations set forth at [see specification 1] (“Specification 1”).

2.3 Data Escrow. Registry Operator shall comply with the registry data escrow procedures posted at [see specification 2]*.

2.4 Monthly Reporting. Within twenty (20) calendar days following the end of each calendar month, Registry Operator shall deliver to ICANN reports in the format posted in the specification at [see specification 3]*.

2.5 Publication of Registration Data. Registry Operator shall provide public access to registration data in accordance with the specification posted at [see specification 4]* (“Specification 4”).

2.6 Reserved Names. Except to the extent that ICANN otherwise expressly authorizes in writing, Registry Operator shall comply with the restrictions on registration of character strings set forth at [see specification 5]* (“Specification 5”). Registry Operator may establish policies concerning the reservation or blocking of additional character strings within the TLD at its discretion. If Registry Operator is the registrant for any domain names in the Registry TLD (other than the Second-Level Reservations for Registry Operations from Specification 5), such registrations must be through an ICANN accredited registrar. Any such registrations will be considered Transactions (as defined in Section 6.1) for purposes of calculating the Registry-Level Transaction Fee to be paid to ICANN by Registry Operator pursuant to Section 6.1.

2.7 Registry Interoperability and Continuity. Registry Operator shall comply with the Registry Interoperability and Continuity Specifications as set forth in Specification 6.

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
2.8 **Protection of Legal Rights of Third Parties.** Registry Operator must specify, and comply with, a process and procedures for launch of the TLD and initial registration-related and ongoing protection of the legal rights of third parties as set forth in the specification at [see specification 7]* (“Specification 7”). Registry Operator may, at its election, implement additional protections of the legal rights of third parties. Any changes or modifications to the process and procedures required by Specification 7 following the Effective Date must be approved in advance by ICANN in writing. Registry Operator must comply with all remedies imposed by ICANN pursuant to Section 2 of Specification 7, subject to Registry Operator’s right to challenge such remedies as set forth in the applicable procedure described therein. Registry Operator shall take reasonable steps to investigate and respond to any reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of the TLD. In responding to such reports, Registry Operator will not be required to take any action in contravention of applicable law.

2.9 **Registrars.**

(a) Registry Operator must use only ICANN accredited registrars in registering domain names. Registry Operator must provide non-discriminatory access to Registry Services to all ICANN accredited registrars that enter into and are in compliance with the registry-registrar agreement for the TLD; provided, that Registry Operator may establish non-discriminatory criteria for qualification to register names in the TLD that are reasonably related to the proper functioning of the TLD. Registry Operator must use a uniform non-discriminatory agreement with all registrars authorized to register names in the TLD. Such agreement may be revised by Registry Operator from time to time; provided, however, that any such revisions must be approved in advance by ICANN.

(b) If Registry Operator (i) becomes an Affiliate or reseller of an ICANN accredited registrar, or (ii) subcontracts the provision of any Registry Services to an ICANN accredited registrar, registrar reseller or any of their respective Affiliates, then, in either such case of (i) or (ii) above, Registry Operator will give ICANN prompt notice of the contract, transaction or other arrangement that resulted in such affiliation, reseller relationship or subcontract, as applicable, including, if requested by ICANN, copies of any contract relating thereto; provided, that ICANN will not disclose such contracts to any third party other than relevant competition authorities. ICANN reserves the right, but not the obligation, to refer any such contract, transaction or other arrangement to relevant competition authorities in the event that ICANN determines that such contract, transaction or other arrangement might raise competition issues.

(c) For the purposes of this Agreement: (i) “Affiliate” means a person or entity that, directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, the person or entity specified, and (ii) “control” (including the terms “controlled by” and “under common control with”) means the possession, directly or indirectly, of the power to direct or cause the direction of the management or policies of a person or entity, whether through the ownership of securities, as trustee or executor, by serving as an employee or a member of a board of directors or equivalent governing body, by contract, by credit arrangement or otherwise.

2.10 **Pricing for Registry Services.**

(a) With respect to initial domain name registrations, Registry Operator shall provide ICANN and each ICANN accredited registrar that has executed the registry-registrar agreement for the TLD advance written notice of any price increase (including as a result of the elimination of any refunds, rebates, discounts, product tying or other programs which had the effect of reducing the price charged to registrars, unless such refunds, rebates, discounts, product tying or other programs are of a limited

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
duration that is clearly and conspicuously disclosed to the registrar when offered) of no less than thirty (30) calendar days. Registry Operator shall offer registrars the option to obtain initial domain name registrations for periods of one to ten years at the discretion of the registrar, but no greater than ten years.

(b) With respect to renewal of domain name registrations, Registry Operator shall provide ICANN and each ICANN accredited registrar that has executed the registry-registrar agreement for the TLD advance written notice of any price increase (including as a result of the elimination of any refunds, rebates, discounts, product tying, Qualified Marketing Programs or other programs which had the effect of reducing the price charged to registrars) of no less than one hundred eighty (180) calendar days. Notwithstanding the foregoing sentence, with respect to renewal of domain name registrations: (i) Registry Operator need only provide thirty (30) calendar days notice of any price increase if the resulting price is less than or equal to (A) for the period beginning on the Effective Date and ending twelve (12) months following the Effective Date, the initial price charged for registrations in the TLD, or (B) for subsequent periods, a price for which Registry Operator provided a notice pursuant to the first sentence of this Section 2.10(b) within the twelve (12) month period preceding the effective date of the proposed price increase; and (ii) Registry Operator need not provide notice of any price increase for the imposition of the Variable Registry-Level Fee set forth in Section 6.3. Registry Operator shall offer registrars the option to obtain domain name registration renewals at the current price (i.e. the price in place prior to any noticed increase) for periods of one to ten years at the discretion of the registrar, but no greater than ten years.

(c) In addition, Registry Operator must have uniform pricing for renewals of domain name registrations (“Renewal Pricing”). For the purposes of determining Renewal Pricing, the price for each domain registration renewal must be identical to the price of all other domain name registration renewals in place at the time of such renewal, and such price must take into account universal application of any refunds, rebates, discounts, product tying or other programs in place at the time of renewal. The foregoing requirements of this Section 2.10(c) shall not apply for (i) purposes of determining Renewal Pricing if the registrar has provided Registry Operator with documentation that demonstrates that the applicable registrant expressly agreed in its registration agreement with registrar to higher Renewal Pricing at the time of the initial registration of the domain name following clear and conspicuous disclosure of such Renewal Pricing to such registrant, and (ii) discounted Renewal Pricing pursuant to a Qualified Marketing Program (as defined below). The parties acknowledge that the purpose of this Section 2.10(c) is to prohibit abusive and/or discriminatory Renewal Pricing practices imposed by Registry Operator without the written consent of the applicable registrant at the time of the initial registration of the domain and this Section 2.10(c) will be interpreted broadly to prohibit such practices. For purposes of this Section 2.10(c), a “Qualified Marketing Program” is a marketing program pursuant to which Registry Operator offers discounted Renewal Pricing, provided that each of the following criteria is satisfied: (i) the program and related discounts are offered for a period of time not to exceed one hundred eighty (180) calendar days (with consecutive substantially similar programs aggregated for purposes of determining the number of calendar days of the program), (ii) all ICANN accredited registrars are provided the same opportunity to qualify for such discounted Renewal Pricing; and (iii) the intent or effect of the program is not to exclude any particular class(es) of registrations (e.g., registrations held by large corporations) or increase the renewal price of any particular class(es) of registrations. Nothing in this Section 2.10(c) shall limit Registry Operator’s obligations pursuant to Section 2.10(b).

(d) Registry Operator shall provide public query-based DNS lookup service for the TLD (that is, operate the Registry TLD zone servers) at its sole expense.

2.11 Contractual and Operational Compliance Audits.

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
(a) ICANN may from time to time (not to exceed twice per calendar year) conduct, or engage a third party to conduct, contractual compliance audits to assess compliance by Registry Operator with its representations and warranties contained in Article 1 of this Agreement and its covenants contained in Article 2 of this Agreement. Such audits shall be tailored to achieve the purpose of assessing compliance, and ICANN will (a) give reasonable advance notice of any such audit, which notice shall specify in reasonable detail the categories of documents, data and other information requested by ICANN, and (b) use commercially reasonable efforts to conduct such audit in such a manner as to not unreasonably disrupt the operations of Registry Operator. As part of such audit and upon request by ICANN, Registry Operator shall timely provide all responsive documents, data and any other information necessary to demonstrate Registry Operator’s compliance with this Agreement. Upon no less than five (5) business days notice (unless otherwise agreed to by Registry Operator), ICANN may, as part of any contractual compliance audit, conduct site visits during regular business hours to assess compliance by Registry Operator with its representations and warranties contained in Article 1 of this Agreement and its covenants contained in Article 2 of this Agreement.

(b) Any audit conducted pursuant to Section 2.11(a) will be at ICANN’s expense, unless (i) Registry Operator (A) controls, is controlled by, is under common control or is otherwise Affiliated with, any ICANN accredited registrar or registrar reseller or any of their respective Affiliates, or (B) has subcontracted the provision of Registry Services to an ICANN accredited registrar or registrar reseller or any of their respective Affiliates, and, in either case of (A) or (B) above, the audit relates to Registry Operator’s compliance with Section 2.14, in which case Registry Operator shall reimburse ICANN for all reasonable costs and expenses associated with the portion of the audit related to Registry Operator’s compliance with Section 2.14, or (ii) the audit is related to a discrepancy in the fees paid by Registry Operator hereunder in excess of 5% to ICANN’s detriment, in which case Registry Operator shall reimburse ICANN for all reasonable costs and expenses associated with the entirety of such audit. In either such case of (i) or (ii) above, such reimbursement will be paid together with the next Registry-Level Fee payment due following the date of transmittal of the cost statement for such audit.

(c) Notwithstanding Section 2.11(a), if Registry Operator is found not to be in compliance with its representations and warranties contained in Article 1 of this Agreement or its covenants contained in Article 2 of this Agreement in two consecutive audits conducted pursuant to this Section 2.11, ICANN may increase the number of such audits to one per calendar quarter.

(d) Registry Operator will give ICANN immediate notice of the commencement of any of the proceedings referenced in Section 4.3(d) or the occurrence of any of the matters specified in Section 4.3(f).

2.12 Continued Operations Instrument. Registry Operator shall comply with the terms and conditions relating to the Continued Operations Instrument set forth in the specification at [see specification 8].

2.13 Emergency Transition. Registry Operator agrees that in the event that any of the registry functions set forth in Section 6 of Specification 10 fails for a period longer than the emergency threshold for such function set forth in Section 6 of Specification 10, ICANN may designate an emergency interim registry operator of the registry for the TLD (an “Emergency Operator”) in accordance with ICANN’s registry transition process (available at ____________) (as the same may be amended from time to time, the “Registry Transition Process”) until such time as Registry Operator has demonstrated to ICANN’s reasonable satisfaction that it can resume operation of the registry for the TLD without the reoccurrence of such failure. Following such demonstration, Registry Operator may transition back into operation of the registry for the TLD pursuant to the procedures set out in the Registry Transition Process,

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
provided that Registry Operator pays all reasonable costs incurred (i) by ICANN as a result of the
designation of the Emergency Operator and (ii) by the Emergency Operator in connection with the
operation of the registry for the TLD, which costs shall be documented in reasonable detail in records that
shall be made available to Registry Operator. In the event ICANN designates an Emergency Operator
pursuant to this Section 2.13 and the Registry Transition Process, Registry Operator shall provide ICANN
or any such Emergency Operator with all data (including the data escrowed in accordance with Section
2.3) regarding operations of the registry for the TLD necessary to maintain operations and registry
functions that may be reasonably requested by ICANN or such Emergency Operator. Registry Operator
agrees that ICANN may make any changes it deems necessary to the IANA database for DNS and
WHOIS records with respect to the TLD in the event that an Emergency Operator is designated pursuant
to this Section 2.13. In addition, in the event of such failure, ICANN shall retain and may enforce its
rights under the Continued Operations Instrument and Alternative Instrument, as applicable.

2.14 Registry Code of Conduct. In connection with the operation of the registry for the
TLD, Registry Operator shall comply with the Registry Code of Conduct as set forth in the specification
at [see specification 9].

2.15 Cooperation with Economic Studies. If ICANN initiates or commissions an economic
study on the impact or functioning of new generic top-level domains on the Internet, the DNS or related
matters, Registry Operator shall reasonably cooperate with such study, including by delivering to ICANN
or its designee conducting such study all data reasonably necessary for the purposes of such study
requested by ICANN or its designee, provided, that Registry Operator may withhold any internal analyses
or evaluations prepared by Registry Operator with respect to such data. Any data delivered to ICANN or
its designee pursuant to this Section 2.15 shall be fully aggregated and anonymized by ICANN or its
designee prior to any disclosure of such data to any third party.

2.16 Registry Performance Specifications. Registry Performance Specifications for
operation of the TLD will be as set forth in the specification at [see specification 10]*. Registry Operator
shall comply with such Performance Specifications and, for a period of at least one year, shall keep
technical and operational records sufficient to evidence compliance with such specifications for each
calendar year during the Term.

2.17 Personal Data. Registry Operator shall (i) notify each ICANN-accredited registrar that
is a party to the registry-registrar agreement for the TLD of the purposes for which data about any
identified or identifiable natural person (“Personal Data”) submitted to Registry Operator by such
registrar is collected and used under this Agreement or otherwise and the intended recipients (or
categories of recipients) of such Personal Data, and (ii) require such registrar to obtain the consent of each
registrant in the TLD for such collection and use of Personal Data. Registry Operator shall take
reasonable steps to protect Personal Data collected from such registrar from loss, misuse, unauthorized
disclosure, alteration or destruction. Registry Operator shall not use or authorize the use of Personal Data
in a way that is incompatible with the notice provided to registrars.

2.18 [Note: For Community-Based TLDs Only] Obligations of Registry Operator to TLD
Community. Registry Operator shall establish registration policies in conformity with the application
submitted with respect to the TLD for: (i) naming conventions within the TLD, (ii) requirements for
registration by members of the TLD community, and (iii) use of registered domain names in conformity
with the stated purpose of the community-based TLD. Registry Operator shall operate the TLD in a
manner that allows the TLD community to discuss and participate in the development and modification of
policies and practices for the TLD. Registry Operator shall establish procedures for the enforcement of
registration policies for the TLD, and resolution of disputes concerning compliance with TLD registration

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
policies, and shall enforce such registration policies. Registry Operator agrees to implement and be bound by the Registry Restrictions Dispute Resolution Procedure as set forth at [insert applicable URL] with respect to disputes arising pursuant to this Section 2.18.]

ARTICLE 3.

COVENANTS OF ICANN

ICANN covenants and agrees with Registry Operator as follows:

3.1 Open and Transparent. Consistent with ICANN’s expressed mission and core values, ICANN shall operate in an open and transparent manner.

3.2 Equitable Treatment. ICANN shall not apply standards, policies, procedures or practices arbitrarily, unjustifiably, or inequitably and shall not single out Registry Operator for disparate treatment unless justified by substantial and reasonable cause.

3.3 TLD Nameservers. ICANN will use commercially reasonable efforts to ensure that any changes to the TLD nameserver designations submitted to ICANN by Registry Operator (in a format and with required technical elements specified by ICANN at http://www.iana.org/domains/root/ will be implemented by ICANN within seven (7) calendar days or as promptly as feasible following technical verifications.

3.4 Root-zone Information Publication. ICANN’s publication of root-zone contact information for the TLD will include Registry Operator and its administrative and technical contacts. Any request to modify the contact information for the Registry Operator must be made in the format specified from time to time by ICANN at http://www.iana.org/domains/root/.

3.5 Authoritative Root Database. To the extent that ICANN is authorized to set policy with regard to an authoritative root server system, ICANN shall use commercially reasonable efforts to (a) ensure that the authoritative root will point to the top-level domain nameservers designated by Registry Operator for the TLD, (b) maintain a stable, secure, and authoritative publicly available database of relevant information about the TLD, in accordance with ICANN publicly available policies and procedures, and (c) coordinate the Authoritative Root Server System so that it is operated and maintained in a stable and secure manner; provided, that ICANN shall not be in breach of this Agreement and ICANN shall have no liability in the event that any third party (including any governmental entity or internet service provider) blocks or restricts access to the TLD in any jurisdiction.

ARTICLE 4.

TERM AND TERMINATION

4.1 Term. The term of this Agreement will be ten years from the Effective Date (as such term may be extended pursuant to Section 4.2, the “Term”).

4.2 Renewal.

(a) This Agreement will be renewed for successive periods of ten years upon the expiration of the initial Term set forth in Section 4.1 and each successive Term, unless:

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
(i) Following notice by ICANN to Registry Operator of a fundamental and material breach of Registry Operator’s covenants set forth in Article 2 or breach of its payment obligations under Article 6 of this Agreement, which notice shall include with specificity the details of the alleged breach, and such breach has not been cured within thirty (30) calendar days of such notice, (A) an arbitrator or court has finally determined that Registry Operator has been in fundamental and material breach of such covenant(s) or in breach of its payment obligations, and (B) Registry Operator has failed to comply with such determination and cure such breach within ten (10) calendar days or such other time period as may be determined by the arbitrator or court; or

(ii) During the then current Term, Registry Operator shall have been found by an arbitrator (pursuant to Section 5.2 of this Agreement) on at least three (3) separate occasions to have been in fundamental and material breach (whether or not cured) of Registry Operator’s covenants set forth in Article 2 or breach of its payment obligations under Article 6 of this Agreement.

(b) Upon the occurrence of the events set forth in Section 4.2(a) (i) or (ii), the Agreement shall terminate at the expiration of the then current Term.

4.3 Termination by ICANN.

(a) ICANN may, upon notice to Registry Operator, terminate this Agreement if: (i) Registry Operator fails to cure (A) any fundamental and material breach of Registry Operator’s representations and warranties set forth in Article 1 or covenants set forth in Article 2, or (B) any breach of Registry Operator’s payment obligations set forth in Article 6 of this Agreement, each within thirty (30) calendar days after ICANN gives Registry Operator notice of such breach, which notice will include with specificity the details of the alleged breach, (ii) an arbitrator or court has finally determined that Registry Operator is in fundamental and material breach of such covenant(s) or in breach of its payment obligations, and (iii) Registry Operator fails to comply with such determination and cure such breach within ten (10) calendar days or such other time period as may be determined by the arbitrator or court.

(b) ICANN may, upon notice to Registry Operator, terminate this Agreement if Registry Operator fails to complete all testing and procedures (identified by ICANN in writing to Registry Operator prior to the date hereof) for delegation of the TLD into the root zone within twelve (12) months of the Effective Date. Registry Operator may request an extension for up to additional twelve (12) months for delegation if it can demonstrate, to ICANN’s reasonable satisfaction, that Registry Operator is working diligently and in good faith toward successfully completing the steps necessary for delegation of the TLD. Any fees paid by Registry Operator to ICANN prior to such termination date shall be retained by ICANN in full.

(c) ICANN may, upon notice to Registry Operator, terminate this Agreement if (i) Registry Operator fails to cure a material breach of Registry Operator’s obligations set forth in Section 2.12 of this Agreement within thirty (30) calendar days of delivery of notice of such breach by ICANN, or if the Continued Operations Instrument is not in effect for greater than sixty (60) consecutive calendar days at any time following the Effective Date, (ii) an arbitrator or court has finally determined that Registry Operator is in material breach of such covenant, and (iii) Registry Operator fails to cure such breach within ten (10) calendar days or such other time period as may be determined by the arbitrator or court.

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
(d) ICANN may, upon notice to Registry Operator, terminate this Agreement if (i) Registry Operator makes an assignment for the benefit of creditors or similar act, (ii) attachment, garnishment or similar proceedings are commenced against Registry Operator, which proceedings are a material threat to Registry Operator’s ability to operate the registry for the TLD, and are not dismissed within sixty (60) days of their commencement, (iii) a trustee, receiver, liquidator or equivalent is appointed in place of Registry Operator or maintains control over any of Registry Operator’s property, (iv) execution is levied upon any property of Registry Operator, (v) proceedings are instituted by or against Registry Operator under any bankruptcy, insolvency, reorganization or other laws relating to the relief of debtors and such proceedings are not dismissed within thirty (30) days of their commencement, or (vi) Registry Operator files for protection under the United States Bankruptcy Code, 11 U.S.C. Section 101 et seq., or a foreign equivalent or liquidates, dissolves or otherwise discontinues its operations or the operation of the TLD.

(e) ICANN may, upon thirty (30) calendar days’ notice to Registry Operator, terminate this Agreement pursuant to Section 2 of Specification 7, subject to Registry Operator’s right to challenge such termination as set forth in the applicable procedure described therein.

(f) ICANN may, upon notice to Registry Operator, terminate this Agreement if (i) Registry Operator knowingly employs any officer that is convicted of a misdemeanor related to financial activities or of any felony, or is judged by a court of competent jurisdiction to have committed fraud or breach of fiduciary duty, or is the subject of a judicial determination that ICANN reasonably deems as the substantive equivalent of any of the foregoing and such officer is not terminated within thirty (30) calendar days of Registry Operator’s knowledge of the foregoing, or (ii) any member of Registry Operator’s board of directors or similar governing body is convicted of a misdemeanor related to financial activities or of any felony, or is judged by a court of competent jurisdiction to have committed fraud or breach of fiduciary duty, or is the subject of a judicial determination that ICANN reasonably deems as the substantive equivalent of any of the foregoing and such member is not removed from Registry Operator’s board of directors or similar governing body within thirty (30) calendar days of Registry Operator’s knowledge of the foregoing.

(g) [Applicable to intergovernmental organizations or governmental entities only.] ICANN may terminate this Agreement pursuant to Section 7.14.

4.4 Termination by Registry Operator.

(a) Registry Operator may terminate this Agreement upon notice to ICANN if, (i) ICANN fails to cure any fundamental and material breach of ICANN’s covenants set forth in Article 3, within thirty (30) calendar days after Registry Operator gives ICANN notice of such breach, which notice will include with specificity the details of the alleged breach, (ii) an arbitrator or court has finally determined that ICANN is in fundamental and material breach of such covenants, and (iii) ICANN fails to comply with such determination and cure such breach within ten (10) calendar days or such other time period as may be determined by the arbitrator or court.

(b) Registry Operator may terminate this Agreement for any reason upon one hundred eighty (180) calendar day advance notice to ICANN.

4.5 Transition of Registry upon Termination of Agreement. Upon expiration of the Term pursuant to Section 4.1 or Section 4.2 or any termination of this Agreement pursuant to Section 4.3 or Section 4.4, Registry Operator shall provide ICANN or any successor registry operator that may be designated by ICANN for the TLD in accordance with this Section 4.5 with all data (including the data

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
escrowed in accordance with Section 2.3) regarding operations of the registry for the TLD necessary to maintain operations and registry functions that may be reasonably requested by ICANN or such successor registry operator. After consultation with Registry Operator, ICANN shall determine whether or not to transition operation of the TLD to a successor registry operator in its sole discretion and in conformance with the Registry Transition Process; provided, however, that if Registry Operator demonstrates to ICANN’s reasonable satisfaction that (i) all domain name registrations in the TLD are registered to, and maintained by, Registry Operator for its own exclusive use, (ii) Registry Operator does not sell, distribute or transfer control or use of any registrations in the TLD to any third party that is not an Affiliate of Registry Operator, and (iii) transitioning operation of the TLD is not necessary to protect the public interest, then ICANN may not transition operation of the TLD to a successor registry operator upon the expiration or termination of this Agreement without the consent of Registry Operator (which shall not be unreasonably withheld, conditioned or delayed). For the avoidance of doubt, the foregoing sentence shall not prohibit ICANN from delegating the TLD pursuant to a future application process for the delegation of top-level domains, subject to any processes and objection procedures instituted by ICANN in connection with such application process intended to protect the rights of third parties. Registry Operator agrees that ICANN may make any changes it deems necessary to the IANA database for DNS and WHOIS records with respect to the TLD in the event of a transition of the TLD pursuant to this Section 4.5. In addition, ICANN or its designee shall retain and may enforce its rights under the Continued Operations Instrument and Alternative Instrument, as applicable, regardless of the reason for termination or expiration of this Agreement.

[Alternative Section 4.5 Transition of Registry upon Termination of Agreement text for intergovernmental organizations or governmental entities or other special circumstances:

“Transition of Registry upon Termination of Agreement. Upon expiration of the Term pursuant to Section 4.1 or Section 4.2 or any termination of this Agreement pursuant to Section 4.3 or Section 4.4, in connection with ICANN’s designation of a successor registry operator for the TLD, Registry Operator and ICANN agree to consult each other and work cooperatively to facilitate and implement the transition of the TLD in accordance with this Section 4.5. After consultation with Registry Operator, ICANN shall determine whether or not to transition operation of the TLD to a successor registry operator in its sole discretion and in conformance with the Registry Transition Process. In the event ICANN determines to transition operation of the TLD to a successor registry operator, upon Registry Operator’s consent (which shall not be unreasonably withheld, conditioned or delayed), Registry Operator shall provide ICANN or such successor registry operator for the TLD with any data regarding operations of the TLD necessary to maintain operations and registry functions that may be reasonably requested by ICANN or such successor registry operator in addition to data escrowed in accordance with Section 2.3 hereof. In the event that Registry Operator does not consent to provide such data, any registry data related to the TLD shall be returned to Registry Operator, unless otherwise agreed upon by the parties. Registry Operator agrees that ICANN may make any changes it deems necessary to the IANA database for DNS and WHOIS records with respect to the TLD in the event of a transition of the TLD pursuant to this Section 4.5. In addition, ICANN or its designee shall retain and may enforce its rights under the Continued Operations Instrument and Alternative Instrument, as applicable, regardless of the reason for termination or expiration of this Agreement.”]

4.6 Effect of Termination. Upon any expiration of the Term or termination of this Agreement, the obligations and rights of the parties hereto shall cease, provided that such expiration or termination of this Agreement shall not relieve the parties of any obligation or breach of this Agreement accruing prior to such expiration or termination, including, without limitation, all accrued payment obligations arising under Article 6. In addition, Article 5, Article 7, Section 2.12, Section 4.5, and this

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
Section 4.6 shall survive the expiration or termination of this Agreement. For the avoidance of doubt, the rights of Registry Operator to operate the registry for the TLD shall immediately cease upon any expiration of the Term or termination of this Agreement.

ARTICLE 5.

DISPUTE RESOLUTION

5.1 Cooperative Engagement. Before either party may initiate arbitration pursuant to Section 5.2 below, ICANN and Registry Operator, following initiation of communications by either party, must attempt to resolve the dispute by engaging in good faith discussion over a period of at least fifteen (15) calendar days.

5.2 Arbitration. Disputes arising under or in connection with this Agreement, including requests for specific performance, will be resolved through binding arbitration conducted pursuant to the rules of the International Court of Arbitration of the International Chamber of Commerce. The arbitration will be conducted in the English language and will occur in Los Angeles County, California. Any arbitration will be in front of a single arbitrator, unless (i) ICANN is seeking punitive or exemplary damages, or operational sanctions, or (ii) the parties agree in writing to a greater number of arbitrators. In either case of clauses (i) or (ii) in the preceding sentence, the arbitration will be in front of three arbitrators with each party selecting one arbitrator and the two selected arbitrators selecting the third arbitrator. In order to expedite the arbitration and limit its cost, the arbitrator(s) shall establish page limits for the parties’ filings in conjunction with the arbitration, and should the arbitrator(s) determine that a hearing is necessary, the hearing shall be limited to one (1) calendar day, provided that in any arbitration in which ICANN is seeking punitive or exemplary damages, or operational sanctions, the hearing may be extended for one (1) additional calendar day if agreed upon by the parties or ordered by the arbitrator(s) based on the arbitrator(s) independent determination or the reasonable request of one of the parties thereto. The prevailing party in the arbitration will have the right to recover its costs and reasonable attorneys’ fees, which the arbitrator(s) shall include in the awards. In the event the arbitrators determine that Registry Operator has been repeatedly and willfully in fundamental and material breach of its obligations set forth in Article 2, Article 6 or Section 5.4 of this Agreement, ICANN may request the arbitrators award punitive or exemplary damages, or operational sanctions (including without limitation an order temporarily restricting Registry Operator’s right to sell new registrations). In any litigation involving ICANN concerning this Agreement, jurisdiction and exclusive venue for such litigation will be in a court located in Los Angeles County, California; however, the parties will also have the right to enforce a judgment of such a court in any court of competent jurisdiction.

[Alternative Section 5.2 Arbitration text for intergovernmental organizations or governmental entities or other special circumstances:

“Arbitration. Disputes arising under or in connection with this Agreement, including requests for specific performance, will be resolved through binding arbitration conducted pursuant to the rules of the International Court of Arbitration of the International Chamber of Commerce. The arbitration will be conducted in the English language and will occur in Geneva, Switzerland, unless another location is mutually agreed upon by Registry Operator and ICANN. Any arbitration will be in front of a single arbitrator, unless (i) ICANN is seeking punitive or exemplary damages, or operational sanctions, or (ii) the parties agree in writing to a greater number of arbitrators. In either case of clauses (i) or (ii) in the preceding sentence, the arbitration will be in front of three arbitrators with each party selecting one arbitrator and the two selected arbitrators selecting the third arbitrator. In order to expedite the arbitration and limit its cost, the arbitrator(s) shall establish page limits for the parties’ filings in conjunction with the

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
arbitration, and should the arbitrator(s) determine that a hearing is necessary, the hearing shall be limited to one (1) calendar day, provided that in any arbitration in which ICANN is seeking punitive or exemplary damages, or operational sanctions, the hearing may be extended for one (1) additional calendar day if agreed upon by the parties or ordered by the arbitrator(s) based on the arbitrator(s) independent determination or the reasonable request of one of the parties thereto. The prevailing party in the arbitration will have the right to recover its costs and reasonable attorneys’ fees, which the arbitrator(s) shall include in the awards. In the event the arbitrators determine that Registry Operator has been repeatedly and willfully in fundamental and material breach of its obligations set forth in Article 2, Article 6 or Section 5.4 of this Agreement, ICANN may request the arbitrators award punitive or exemplary damages, or operational sanctions (including without limitation an order temporarily restricting Registry Operator’s right to sell new registrations). In any litigation involving ICANN concerning this Agreement, jurisdiction and exclusive venue for such litigation will be in a court located in Geneva, Switzerland, unless an another location is mutually agreed upon by Registry Operator and ICANN; however, the parties will also have the right to enforce a judgment of such a court in any court of competent jurisdiction.

5.3 Limitation of Liability. ICANN’s aggregate monetary liability for violations of this Agreement will not exceed an amount equal to the Registry-Level Fees paid by Registry Operator to ICANN within the preceding twelve-month period pursuant to this Agreement (excluding the Variable Registry-Level Fee set forth in Section 6.3, if any). Registry Operator’s aggregate monetary liability to ICANN for breaches of this Agreement will be limited to an amount equal to the fees paid to ICANN during the preceding twelve-month period (excluding the Variable Registry-Level Fee set forth in Section 6.3, if any), and punitive and exemplary damages, if any, awarded in accordance with Section 5.2. In no event shall either party be liable for special, punitive, exemplary or consequential damages arising out of or in connection with this Agreement or the performance or nonperformance of obligations undertaken in this Agreement, except as provided in Section 5.2. Except as otherwise provided in this Agreement, neither party makes any warranty, express or implied, with respect to the services rendered by itself, its servants or agents, or the results obtained from their work, including, without limitation, any implied warranty of merchantability, non-infringement or fitness for a particular purpose.

5.4 Specific Performance. Registry Operator and ICANN agree that irreparable damage could occur if any of the provisions of this Agreement was not performed in accordance with its specific terms. Accordingly, the parties agree that they each shall be entitled to seek from the arbitrator specific performance of the terms of this Agreement (in addition to any other remedy to which each party is entitled).

ARTICLE 6.

FEES

6.1 Registry-Level Fees. Registry Operator shall pay ICANN a Registry-Level Fee equal to (i) the Registry Fixed Fee of US$6,250 per calendar quarter and (ii) the Registry-Level Transaction Fee. The Registry-Level Transaction Fee will be equal to the number of annual increments of an initial or renewal domain name registration (at one or more levels, and including renewals associated with transfers from one ICANN-accredited registrar to another, each a “Transaction”), during the applicable calendar quarter multiplied by US$0.25; provided, however that the Registry-Level Transaction Fee shall not apply until and unless more than 50,000 Transactions have occurred in the TLD during any calendar quarter or any four calendar quarter period (the “Transaction Threshold”) and shall apply to each Transaction that occurred during each quarter in which the Transaction Threshold has been met, but shall not apply to each quarter in which the Transaction Threshold has not been met. Registry Operator shall pay the Registry-
Level Fees on a quarterly basis by the 20th day following the end of each calendar quarter (i.e., on April 20, July 20, October 20 and January 20 for the calendar quarters ending March 31, June 30, September 30 and December 31) of the year to an account designated by ICANN.

6.2 Cost Recovery for RSTEP. Requests by Registry Operator for the approval of Additional Services pursuant to Section 2.1 may be referred by ICANN to the Registry Services Technical Evaluation Panel ("RSTEP") pursuant to that process at http://www.icann.org/en/registries/rsep/. In the event that such requests are referred to RSTEP, Registry Operator shall remit to ICANN the invoiced cost of the RSTEP review within ten (10) business days of receipt of a copy of the RSTEP invoice from ICANN, unless ICANN determines, in its sole and absolute discretion, to pay all or any portion of the invoiced cost of such RSTEP review.

6.3 Variable Registry-Level Fee.

(a) If the ICANN accredited registrars (as a group) do not approve pursuant to the terms of their registrar accreditation agreements with ICANN the variable accreditation fees established by the ICANN Board of Directors for any ICANN fiscal year, upon delivery of notice from ICANN, Registry Operator shall pay to ICANN a Variable Registry-Level Fee, which shall be paid on a fiscal quarter basis, and shall accrue as of the beginning of the first fiscal quarter of such ICANN fiscal year. The fee will be calculated and invoiced by ICANN on a quarterly basis, and shall be paid by Registry Operator within sixty (60) calendar days with respect to the first quarter of such ICANN fiscal year and within twenty (20) calendar days with respect to each remaining quarter of such ICANN fiscal year, of receipt of the invoiced amount by ICANN. The Registry Operator may invoice and collect the Variable Registry-Level Fees from the registrars who are party to a registry-registrar agreement with Registry Operator (which agreement may specifically provide for the reimbursement of Variable Registry-Level Fees paid by Registry Operator pursuant to this Section 6.3); provided, that the fees shall be invoiced to all ICANN accredited registrars if invoiced to any. The Variable Registry-Level Fee, if collectible by ICANN, shall be an obligation of Registry Operator and shall be due and payable as provided in this Section 6.3 irrespective of Registry Operator’s ability to seek and obtain reimbursement of such fee from registrars. In the event ICANN later collects variable accreditation fees for which Registry Operator has paid ICANN a Variable Registry-Level Fee, ICANN shall reimburse the Registry Operator an appropriate amount of the Variable Registry-Level Fee, as reasonably determined by ICANN. If the ICANN accredited registrars (as a group) do approve pursuant to the terms of their registrar accreditation agreements with ICANN the variable accreditation fees established by the ICANN Board of Directors for a fiscal year, ICANN shall not be entitled to a Variable-Level Fee hereunder for such fiscal year, irrespective of whether the ICANN accredited registrars comply with their payment obligations to ICANN during such fiscal year.

(b) The amount of the Variable Registry-Level Fee will be specified for each registrar, and may include both a per-registrar component and a transactional component. The per-registrar component of the Variable Registry-Level Fee shall be specified by ICANN in accordance with the budget adopted by the ICANN Board of Directors for each ICANN fiscal year. The transactional component of the Variable Registry-Level Fee shall be specified by ICANN in accordance with the budget adopted by the ICANN Board of Directors for each ICANN fiscal year but shall not exceed US$0.25 per domain name registration (including renewals associated with transfers from one ICANN-accredited registrar to another) per year.

6.4 Adjustments to Fees. Notwithstanding any of the fee limitations set forth in this Article 6, commencing upon the expiration of the first year of this Agreement, and upon the expiration of each year thereafter during the Term, the then current fees set forth in Section 6.1 and Section 6.3 may be

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
adjusted, at ICANN’s discretion, by a percentage equal to the percentage change, if any, in (i) the Consumer Price Index for All Urban Consumers, U.S. City Average (1982-1984 = 100) published by the United States Department of Labor, Bureau of Labor Statistics, or any successor index (the “CPI”) for the month which is one (1) month prior to the commencement of the applicable year, over (ii) the CPI published for the month which is one (1) month prior to the commencement of the immediately prior year. In the event of any such increase, ICANN shall provide notice to Registry Operator specifying the amount of such adjustment. Any fee adjustment under this Section 6.4 shall be effective as of the first day of the year in which the above calculation is made.

6.5 Additional Fee on Late Payments. For any payments thirty (30) calendar days or more overdue under this Agreement, Registry Operator shall pay an additional fee on late payments at the rate of 1.5% per month or, if less, the maximum rate permitted by applicable law.

ARTICLE 7.

MISCELLANEOUS

7.1 Indemnification of ICANN.

(a) Registry Operator shall indemnify and defend ICANN and its directors, officers, employees, and agents (collectively, “Indemnitees”) from and against any and all third-party claims, damages, liabilities, costs, and expenses, including reasonable legal fees and expenses, arising out of or relating to intellectual property ownership rights with respect to the TLD, the delegation of the TLD to Registry Operator, Registry Operator’s operation of the registry for the TLD or Registry Operator’s provision of Registry Services, provided that Registry Operator shall not be obligated to indemnify or defend any Indemnitee to the extent the claim, damage, liability, cost or expense arose: (i) due to the actions or omissions of ICANN, its subcontractors, panelists or evaluators specifically related to and occurring during the registry TLD application process (other than actions or omissions requested by or for the benefit of Registry Operator), or (ii) due to a breach by ICANN of any obligation contained in this Agreement or any willful misconduct by ICANN. This Section shall not be deemed to require Registry Operator to reimburse or otherwise indemnify ICANN for costs associated with the negotiation or execution of this Agreement, or with monitoring or management of the parties’ respective obligations hereunder. Further, this Section shall not apply to any request for attorney’s fees in connection with any litigation or arbitration between or among the parties, which shall be governed by Article 5 or otherwise awarded by a court or arbitrator.

[Alternative Section 7.1(a) text for intergovernmental organizations or governmental entities:

“Registry Operator shall use its best efforts to cooperate with ICANN in order to ensure that ICANN does not incur any costs associated with claims, damages, liabilities, costs and expenses, including reasonable legal fees and expenses, arising out of or relating to intellectual property ownership rights with respect to the TLD, the delegation of the TLD to Registry Operator, Registry Operator’s operation of the registry for the TLD or Registry Operator’s provision of Registry Services, provided that Registry Operator shall not be obligated to provide such cooperation to the extent the claim, damage, liability, cost or expense arose due to a breach by ICANN of any of its obligations contained in this Agreement or any willful misconduct by ICANN. This Section shall not be deemed to require Registry Operator to reimburse or otherwise indemnify ICANN for costs associated with the negotiation or execution of this Agreement, or with monitoring or management of the parties’ respective obligations hereunder. Further, this Section shall not apply to any request for attorney’s fees in connection with any

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
litigation or arbitration between or among the parties, which shall be governed by Article 5 or otherwise awarded by a court or arbitrator.”]

(b) For any claims by ICANN for indemnification whereby multiple registry operators (including Registry Operator) have engaged in the same actions or omissions that gave rise to the claim, Registry Operator’s aggregate liability to indemnify ICANN with respect to such claim shall be limited to a percentage of ICANN’s total claim, calculated by dividing the number of total domain names under registration with Registry Operator within the TLD (which names under registration shall be calculated consistently with Article 6 hereof for any applicable quarter) by the total number of domain names under registration within all top level domains for which the registry operators thereof are engaging in the same acts or omissions giving rise to such claim. For the purposes of reducing Registry Operator’s liability under Section 7.1(a) pursuant to this Section 7.1(b), Registry Operator shall have the burden of identifying the other registry operators that are engaged in the same actions or omissions that gave rise to the claim, and demonstrating, to ICANN’s reasonable satisfaction, such other registry operators’ culpability for such actions or omissions. For the avoidance of doubt, in the event that a registry operator is engaged in the same acts or omissions giving rise to the claims, but such registry operator(s) do not have the same or similar indemnification obligations to ICANN as set forth in Section 7.1(a) above, the number of domains under management by such registry operator(s) shall nonetheless be included in the calculation in the preceding sentence. [Note: This Section 7.1(b) is inapplicable to intergovernmental organizations or governmental entities.]

7.2 Indemnification Procedures. If any third-party claim is commenced that is indemnified under Section 7.1 above, ICANN shall provide notice thereof to Registry Operator as promptly as practicable. Registry Operator shall be entitled, if it so elects, in a notice promptly delivered to ICANN, to immediately take control of the defense and investigation of such claim and to employ and engage attorneys reasonably acceptable to ICANN to handle and defend the same, at Registry Operator’s sole cost and expense, provided that in all events ICANN will be entitled to control at its sole cost and expense the litigation of issues concerning the validity or interpretation of ICANN’s policies, Bylaws or conduct. ICANN shall cooperate, at Registry Operator’s cost and expense, in all reasonable respects with Registry Operator and its attorneys in the investigation, trial, and defense of such claim and any appeal arising therefrom, and may, at its own cost and expense, participate, through its attorneys or otherwise, in such investigation, trial and defense of such claim and any appeal arising therefrom. No settlement of a claim that involves a remedy affecting ICANN other than the payment of money in an amount that is fully indemnified by Registry Operator will be entered into without the consent of ICANN. If Registry Operator does not assume full control over the defense of a claim subject to such defense in accordance with this Section 7.2, ICANN will have the right to defend the claim in such manner as it may deem appropriate, at the cost and expense of Registry Operator and Registry Operator shall cooperate in such defense. [Note: This Section 7.2 is inapplicable to intergovernmental organizations or governmental entities.]

7.3 Defined Terms. For purposes of this Agreement, unless such definitions are amended pursuant to a Consensus Policy at a future date, in which case the following definitions shall be deemed amended and restated in their entirety as set forth in such Consensus Policy, Security and Stability shall be defined as follows:

(a) For the purposes of this Agreement, an effect on “Security” shall mean (1) the unauthorized disclosure, alteration, insertion or destruction of registry data, or (2) the unauthorized access to or disclosure of information or resources on the Internet by systems operating in accordance with all applicable standards.

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
For purposes of this Agreement, an effect on “Stability” shall refer to (1) lack of compliance with applicable relevant standards that are authoritative and published by a well-established and recognized Internet standards body, such as the relevant Standards-Track or Best Current Practice Requests for Comments (“RFCs”) sponsored by the Internet Engineering Task Force; or (2) the creation of a condition that adversely affects the throughput, response time, consistency or coherence of responses to Internet servers or end systems operating in accordance with applicable relevant standards that are authoritative and published by a well-established and recognized Internet standards body, such as the relevant Standards-Track or Best Current Practice RFCs, and relying on Registry Operator’s delegated information or provisioning of services.

7.4 No Offset. All payments due under this Agreement will be made in a timely manner throughout the Term and notwithstanding the pendency of any dispute (monetary or otherwise) between Registry Operator and ICANN.

7.5 Change in Control; Assignment and Subcontracting. Neither party may assign this Agreement without the prior written approval of the other party, which approval will not be unreasonably withheld. Notwithstanding the foregoing, ICANN may assign this Agreement in conjunction with a reorganization or re-incorporation of ICANN to another nonprofit corporation or similar entity organized in the same legal jurisdiction in which ICANN is currently organized for the same or substantially the same purposes. For purposes of this Section 7.5, a direct or indirect change of control of Registry Operator or any material subcontracting arrangement with respect to the operation of the registry for the TLD shall be deemed an assignment. ICANN shall be deemed to have reasonably withheld its consent to any such a direct or indirect change of control or subcontracting arrangement in the event that ICANN reasonably determines that the person or entity acquiring control of Registry Operator or entering into such subcontracting arrangement (or the ultimate parent entity of such acquiring or subcontracting entity) does not meet the ICANN-adopted registry operator criteria or qualifications then in effect. In addition, without limiting the foregoing, Registry Operator must provide no less than thirty (30) calendar days advance notice to ICANN of any material subcontracting arrangements, and any agreement to subcontract portions of the operations of the TLD must mandate compliance with all covenants, obligations and agreements by Registry Operator hereunder, and Registry Operator shall continue to be bound by such covenants, obligations and agreements. Without limiting the foregoing, Registry Operator must also provide no less than thirty (30) calendar days advance notice to ICANN prior to the consummation of any transaction anticipated to result in a direct or indirect change of control of Registry Operator. Such change of control notification shall include a statement that affirms that the ultimate parent entity of the party acquiring such control meets the ICANN-adopted specification or policy on registry operator criteria then in effect, and affirms that Registry Operator is in compliance with its obligations under this Agreement. Within thirty (30) calendar days of such notification, ICANN may request additional information from Registry Operator establishing compliance with this Agreement, in which case Registry Operator must supply the requested information within fifteen (15) calendar days. If ICANN fails to expressly provide or withhold its consent to any direct or indirect change of control of Registry Operator or any material subcontracting arrangement within thirty (30) (or, if ICANN has requested additional information from Registry Operator as set forth above, sixty (60)) calendar days of the receipt of written notice of such transaction from Registry Operator, ICANN shall be deemed to have consented to such transaction. In connection with any such transaction, Registry Operator shall comply with the Registry Transition Process.

7.6 Amendments and Waivers.

(a) If ICANN determines that an amendment to this Agreement (including to the Specifications referred to herein) and all other registry agreements between ICANN and the Applicable
Registry Operators (the “Applicable Registry Agreements”) is desirable (each, a “Special Amendment”), ICANN may submit a Special Amendment for approval by the Applicable Registry Operators pursuant to the process set forth in this Section 7.6, provided that a Special Amendment is not a Restricted Amendment (as defined below). Prior to submitting a Special Amendment for such approval, ICANN shall first consult in good faith with the Working Group (as defined below) regarding the form and substance of a Special Amendment. The duration of such consultation shall be reasonably determined by ICANN based on the substance of the Special Amendment. Following such consultation, ICANN may propose the adoption of a Special Amendment by publicly posting such amendment on its website for no less than thirty (30) calendar days (the “Posting Period”) and providing notice of such amendment by ICANN to the Applicable Registry Operators in accordance with Section 7.8. ICANN will consider the public comments submitted on a Special Amendment during the Posting Period (including comments submitted by the Applicable Registry Operators).

(b) If, within two (2) calendar years of the expiration of the Posting Period (the “Approval Period”), (i) the ICANN Board of Directors approves a Special Amendment (which may be in a form different than submitted for public comment) and (ii) such Special Amendment receives Registry Operator Approval (as defined below), such Special Amendment shall be deemed approved (an “Approved Amendment”) by the Applicable Registry Operators (the last date on which such approvals are obtained is herein referred to as the “Amendment Approval Date”) and shall be effective and deemed an amendment to this Agreement upon sixty (60) calendar days notice from ICANN to Registry Operator (the “Amendment Effective Date”). In the event that a Special Amendment is not approved by the ICANN Board of Directors or does not receive Registry Operator Approval within the Approval Period, the Special Amendment will have no effect. The procedure used by ICANN to obtain Registry Operator Approval shall be designed to document the written approval of the Applicable Registry Operators, which may be in electronic form.

(c) During the thirty (30) calendar day period following the Amendment Approval Date, Registry Operator (so long as it did not vote in favor of the Approved Amendment) may apply in writing to ICANN for an exemption from the Approved Amendment (each such request submitted by Registry Operator hereunder, an “Exemption Request”). Each Exemption Request will set forth the basis for such request and provide detailed support for an exemption from the Approved Amendment. An Exemption Request may also include a detailed description and support for any alternatives to, or a variation of, the Approved Amendment proposed by such Registry Operator. An Exemption Request may only be granted upon a clear and convincing showing by Registry Operator that compliance with the Approved Amendment conflicts with applicable laws or would have a material adverse effect on the long-term financial condition or results of operations of Registry Operator. No Exemption Request will be granted if ICANN determines, in its reasonable discretion, that granting such Exemption Request would be materially harmful to registrants or result in the denial of a direct benefit to registrants. Within ninety (90) calendar days of ICANN’s receipt of an Exemption Request, ICANN shall either approve (which approval may be conditioned or consist of alternatives to or a variation of the Approved Amendment) or deny the Exemption Request in writing, during which time the Approved Amendment will not amend this Agreement; provided, that any such conditions, alternatives or variations shall be effective and, to the extent applicable, will amend this Agreement as of the Amendment Effective Date. If the Exemption Request is approved by ICANN, the Approved Amendment will not amend this Agreement. If such Exemption Request is denied by ICANN, the Approved Amendment will amend this Agreement as of the Amendment Effective Date (or, if such date has passed, such Approved Amendment shall be deemed effective immediately on the date of such denial), provided that Registry Operator may, within thirty (30) calendar days following receipt of ICANN’s determination, appeal ICANN’s decision to deny the Exemption Request pursuant to the dispute resolution procedures set forth in Article 5. The Approved

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
Amendment will be deemed not to have amended this Agreement during the pendency of the dispute resolution process. For avoidance of doubt, only Exemption Requests submitted by Registry Operator that are approved by ICANN pursuant to this Section 7.6(c) or through an arbitration decision pursuant to Article 5 shall exempt Registry Operator from any Approved Amendment, and no exemption request granted to any other Applicable Registry Operator (whether by ICANN or through arbitration) shall have any effect under this Agreement or exempt Registry Operator from any Approved Amendment.

(d) Except as set forth in this Section 7.6, no amendment, supplement or modification of this Agreement or any provision hereof shall be binding unless executed in writing by both parties, and nothing in this Section 7.6 shall restrict ICANN and Registry Operator from entering into bilateral amendments and modifications to this Agreement negotiated solely between the two parties. No waiver of any provision of this Agreement shall be binding unless evidenced by a writing signed by the party waiving compliance with such provision. No waiver of any of the provisions of this Agreement or failure to enforce any of the provisions hereof shall be deemed or shall constitute a waiver of any other provision hereof, nor shall any such waiver constitute a continuing waiver unless otherwise expressly provided. For the avoidance of doubt, nothing in this Section 7.6 shall be deemed to limit Registry Operator’s obligation to comply with Section 2.2.

(e) For purposes of this Section 7.6, the following terms shall have the following meanings:

(i) “Applicable Registry Operators” means, collectively, the registry operators of the top-level domains party to a registry agreement that contains a provision similar to this Section 7.6, including Registry Operator.

(ii) “Registry Operator Approval” means the receipt of each of the following: (A) the affirmative approval of the Applicable Registry Operators whose payments to ICANN accounted for two-thirds of the total amount of fees (converted to U.S. dollars, if applicable) paid to ICANN by all the Applicable Registry Operators during the immediately previous calendar year pursuant to the Applicable Registry Agreements, and (B) the affirmative approval of a majority of the Applicable Registry Operators at the time such approval is obtained. For avoidance of doubt, with respect to clause (B), each Applicable Registry Operator shall have one vote for each top-level domain operated by such Registry Operator pursuant to an Applicable Registry Agreement.

(iii) “Restricted Amendment” means the following: (i) an amendment of Specification 1, (ii) except to the extent addressed in Section 2.10 hereof, an amendment that specifies the price charged by Registry Operator to registrars for domain name registrations, (iii) an amendment to the definition of Registry Services as set forth in the first paragraph of Section 2.1 of Specification 6, or (iv) an amendment to the length of the Term.

(iv) “Working Group” means representatives of the Applicable Registry Operators and other members of the community that ICANN appoints, from time to time, to serve as a working group to consult on amendments to the Applicable Registry Agreements (excluding bilateral amendments pursuant to Section 7.6(d)).

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
7.7 **No Third-Party Beneficiaries.** This Agreement will not be construed to create any obligation by either ICANN or Registry Operator to any non-party to this Agreement, including any registrar or registered name holder.

7.8 **General Notices.** Except for notices pursuant to Section 7.6, all notices to be given under or in relation to this Agreement will be given either (i) in writing at the address of the appropriate party as set forth below or (ii) via facsimile or electronic mail as provided below, unless that party has given a notice of change of postal or email address, or facsimile number, as provided in this agreement. All notices under Section 7.6 shall be given by both posting of the applicable information on ICANN’s web site and transmission of such information to Registry Operator by electronic mail. Any change in the contact information for notice below will be given by the party within thirty (30) calendar days of such change. Notices, designations, determinations, and specifications made under this Agreement will be in the English language. Other than notices under Section 7.6, any notice required by this Agreement will be deemed to have been properly given (i) if in paper form, when delivered in person or via courier service with confirmation of receipt or (ii) if via facsimile or by electronic mail, upon confirmation of receipt by the recipient’s facsimile machine or email server, provided that such notice via facsimile or electronic mail shall be followed by a copy sent by regular postal mail service within two (2) business days. Any notice required by Section 7.6 will be deemed to have been given when electronically posted on ICANN’s website and upon confirmation of receipt by the email server. In the event other means of notice become practically achievable, such as notice via a secure website, the parties will work together to implement such notice means under this Agreement.

If to ICANN, addressed to:
Internet Corporation for Assigned Names and Numbers
4676 Admiralty Way, Suite 330
Marina Del Rey, California 90292
Telephone: 1-310-823-9358
Facsimile: 1-310-823-8649
Attention: President and CEO

Attention:  

With a Required Copy to:  
Email: (As specified from time to time.)

7.9 **Entire Agreement.** This Agreement (including those specifications and documents incorporated by reference to URL locations which form a part of it) constitutes the entire agreement of the parties hereto pertaining to the operation of the TLD and supersedes all prior agreements, understandings, negotiations and discussions, whether oral or written, between the parties on that subject.

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
7.10 **English Language Controls.** Notwithstanding any translated version of this Agreement and/or specifications that may be provided to Registry Operator, the English language version of this Agreement and all referenced specifications are the official versions that bind the parties hereto. In the event of any conflict or discrepancy between any translated version of this Agreement and the English language version, the English language version controls. Notices, designations, determinations, and specifications made under this Agreement shall be in the English language.

7.11 **Ownership Rights.** Nothing contained in this Agreement shall be construed as establishing or granting to Registry Operator any property ownership rights or interests in the TLD or the letters, words, symbols or other characters making up the TLD string.

7.12 **Severability.** This Agreement shall be deemed severable; the invalidity or unenforceability of any term or provision of this Agreement shall not affect the validity or enforceability of the balance of this Agreement or of any other term hereof, which shall remain in full force and effect. If any of the provisions hereof are determined to be invalid or unenforceable, the parties shall negotiate in good faith to modify this Agreement so as to effect the original intent of the parties as closely as possible.

7.13 **Court Orders.** ICANN will respect any order from a court of competent jurisdiction, including any orders from any jurisdiction where the consent or non-objection of the government was a requirement for the delegation of the TLD. Notwithstanding any other provision of this Agreement, ICANN's implementation of any such order will not be a breach of this Agreement.

*Note: The following section is applicable to intergovernmental organizations or governmental entities only.*

7.14 **Special Provision Relating to Intergovernmental Organizations or Governmental Entities.**

(a) ICANN acknowledges that Registry Operator is an entity subject to public international law, including international treaties applicable to Registry Operator (such public international law and treaties, collectively hereinafter the “Applicable Laws”). Nothing in this Agreement and its related specifications shall be construed or interpreted to require Registry Operator to violate Applicable Laws or prevent compliance therewith. The Parties agree that Registry Operator’s compliance with Applicable Laws shall not constitute a breach of this Agreement.

(b) In the event Registry Operator reasonably determines that any provision of this Agreement and its related specifications, or any decisions or policies of ICANN referred to in this Agreement, including but not limited to Temporary Policies and Consensus Policies (such provisions, specifications and policies, collectively hereinafter, “ICANN Requirements”), may conflict with or violate Applicable Law (hereinafter, a “Potential Conflict”), Registry Operator shall provide detailed notice (a “Notice”) of such Potential Conflict to ICANN as early as possible and, in the case of a Potential Conflict with a proposed Consensus Policy, no later than the end of any public comment period on such proposed Consensus Policy. In the event Registry Operator determines that there is Potential Conflict between a proposed Applicable Law and any ICANN Requirement, Registry Operator shall provide detailed Notice of such Potential Conflict to ICANN as early as possible and, in the case of a Potential Conflict with a proposed Consensus Policy, no later than the end of any public comment period on such proposed Consensus Policy.

(c) As soon as practicable following such review, the parties shall attempt to resolve the Potential Conflict by cooperative engagement pursuant to the procedures set forth in Section 5.1. In

* Final text will be posted on ICANN website; agreement reference to be replaced by hyperlink.
addition, Registry Operator shall use its best efforts to eliminate or minimize any impact arising from such Potential Conflict between Applicable Laws and any ICANN Requirement. If, following such cooperative engagement, Registry Operator determines that the Potential Conflict constitutes an actual conflict between any ICANN Requirement, on the one hand, and Applicable Laws, on the other hand, then ICANN shall waive compliance with such ICANN Requirement (provided that the parties shall negotiate in good faith on a continuous basis thereafter to mitigate or eliminate the effects of such non-compliance on ICANN), unless ICANN reasonably and objectively determines that the failure of Registry Operator to comply with such ICANN Requirement would constitute a threat to the Security and Stability of Registry Services, the Internet or the DNS (hereinafter, an “ICANN Determination”). Following receipt of notice by Registry Operator of such ICANN Determination, Registry Operator shall be afforded a period of ninety (90) calendar days to resolve such conflict with an Applicable Law. If the conflict with an Applicable Law is not resolved to ICANN’s complete satisfaction during such period, Registry Operator shall have the option to submit, within ten (10) calendar days thereafter, the matter to binding arbitration as defined in subsection (d) below. If during such period, Registry Operator does not submit the matter to arbitration pursuant to subsection (d) below, ICANN may, upon notice to Registry Operator, terminate this Agreement with immediate effect.

(d) If Registry Operator disagrees with an ICANN Determination, Registry Operator may submit the matter to binding arbitration pursuant to the provisions of Section 5.2, except that the sole issue presented to the arbitrator for determination will be whether or not ICANN reasonably and objectively reached the ICANN Determination. For the purposes of such arbitration, ICANN shall present evidence to the arbitrator supporting the ICANN Determination. If the arbitrator determines that ICANN did not reasonably and objectively reach the ICANN Determination, then ICANN shall waive Registry Operator’s compliance with the subject ICANN Requirement. If the arbitrators or pre-arbitral referee, as applicable, determine that ICANN did reasonably and objectively reach the ICANN Determination, then, upon notice to Registry Operator, ICANN may terminate this Agreement with immediate effect.

(e) Registry Operator hereby represents and warrants that, to the best of its knowledge as of the date of execution of this Agreement, no existing ICANN Requirement conflicts with or violates any Applicable Law.

(f) Notwithstanding any other provision of this Section 7.14, following an ICANN Determination and prior to a finding by an arbitrator pursuant to Section 7.14(d) above, ICANN may, subject to prior consultations with Registry Operator, take such reasonable technical measures as it deems necessary to ensure the Security and Stability of Registry Services, the Internet and the DNS. These reasonable technical measures shall be taken by ICANN on an interim basis, until the earlier of the date of conclusion of the arbitration procedure referred to in Section 7.14(d) above or the date of complete resolution of the conflict with an Applicable Law. In case Registry Operator disagrees with such technical measures taken by ICANN, Registry Operator may submit the matter to binding arbitration pursuant to the provisions of Section 5.2 above, during which process ICANN may continue to take such technical measures. In the event that ICANN takes such measures, Registry Operator shall pay all costs incurred by ICANN as a result of taking such measures. In addition, in the event that ICANN takes such measures, ICANN shall retain and may enforce its rights under the Continued Operations Instrument and Alternative Instrument, as applicable.

EXHIBIT A

Approved Services
SPECIFICATION 1

CONSENSUS POLICIES AND TEMPORARY POLICIES SPECIFICATION

1.1. “Consensus Policies” are those policies established (1) pursuant to the procedure set forth in ICANN's Bylaws and due process, and (2) covering those topics listed in Section 1.2 of this document. The Consensus Policy development process and procedure set forth in ICANN's Bylaws may be revised from time to time in accordance with the process set forth therein.

1.2. Consensus Policies and the procedures by which they are developed shall be designed to produce, to the extent possible, a consensus of Internet stakeholders, including the operators of gTLDs. Consensus Policies shall relate to one or more of the following:

   1.2.1. issues for which uniform or coordinated resolution is reasonably necessary to facilitate interoperability, security and/or stability of the Internet or Domain Name System (“DNS”);
   1.2.2. functional and performance specifications for the provision of Registry Services;
   1.2.3. Security and Stability of the registry database for the TLD;
   1.2.4. registry policies reasonably necessary to implement Consensus Policies relating to registry operations or registrars;
   1.2.5. resolution of disputes regarding the registration of domain names (as opposed to the use of such domain names); or
   1.2.6. restrictions on cross-ownership of registry operators and registrars or registrar resellers and regulations and restrictions with respect to registry operations and the use of registry and registrar data in the event that a registry operator and a registrar or registrar reseller are affiliated.

1.3. Such categories of issues referred to in Section 1.2 shall include, without limitation:

   1.3.1. principles for allocation of registered names in the TLD (e.g., first-come/first-served, timely renewal, holding period after expiration);
   1.3.2. prohibitions on warehousing of or speculation in domain names by registries or registrars;
   1.3.3. reservation of registered names in the TLD that may not be registered initially or that may not be renewed due to reasons reasonably related to (i) avoidance of confusion among or misleading of users, (ii) intellectual property, or (iii) the technical management of the DNS or the Internet (e.g., establishment of reservations of names from registration); and
   1.3.4. maintenance of and access to accurate and up-to-date information concerning domain name registrations; and procedures to avoid disruptions of domain name registrations due to suspension or termination of operations by a registry operator or a registrar, including procedures for allocation of responsibility for serving registered domain names in a TLD affected by such a suspension or termination.

1.4. In addition to the other limitations on Consensus Policies, they shall not:
1.4.1. prescribe or limit the price of Registry Services;
1.4.2. modify the terms or conditions for the renewal or termination of the Registry Agreement;
1.4.3. modify the limitations on Temporary Policies (defined below) or Consensus Policies;
1.4.4. modify the provisions in the registry agreement regarding fees paid by Registry Operator to ICANN; or
1.4.5. modify ICANN’s obligations to ensure equitable treatment of registry operators and act in an open and transparent manner.

2. **Temporary Policies.** Registry Operator shall comply with and implement all specifications or policies established by the Board on a temporary basis, if adopted by the Board by a vote of at least two-thirds of its members, so long as the Board reasonably determines that such modifications or amendments are justified and that immediate temporary establishment of a specification or policy on the subject is necessary to maintain the stability or security of Registry Services or the DNS (“Temporary Policies”).

2.1. Such proposed specification or policy shall be as narrowly tailored as feasible to achieve those objectives. In establishing any Temporary Policy, the Board shall state the period of time for which the Temporary Policy is adopted and shall immediately implement the Consensus Policy development process set forth in ICANN's Bylaws.

2.1.1. ICANN shall also issue an advisory statement containing a detailed explanation of its reasons for adopting the Temporary Policy and why the Board believes such Temporary Policy should receive the consensus support of Internet stakeholders.

2.1.2. If the period of time for which the Temporary Policy is adopted exceeds 90 days, the Board shall reaffirm its temporary adoption every 90 days for a total period not to exceed one year, in order to maintain such Temporary Policy in effect until such time as it becomes a Consensus Policy. If the one year period expires or, if during such one year period, the Temporary Policy does not become a Consensus Policy and is not reaffirmed by the Board, Registry Operator shall no longer be required to comply with or implement such Temporary Policy.

3. **Notice and Conflicts.** Registry Operator shall be afforded a reasonable period of time following notice of the establishment of a Consensus Policy or Temporary Policy in which to comply with such policy or specification, taking into account any urgency involved. In the event of a conflict between Registry Services and Consensus Policies or any Temporary Policy, the Consensus Policies or Temporary Policy shall control, but only with respect to subject matter in conflict.
SPECIFICATION 2
DATA ESCROW REQUIREMENTS

Registry Operator will engage an independent entity to act as data escrow agent (“Escrow Agent”) for the provision of data escrow services related to the Registry Agreement. The following Technical Specifications set forth in Part A, and Legal Requirements set forth in Part B, will be included in any data escrow agreement between Registry Operator and the Escrow Agent, under which ICANN must be named a third-party beneficiary. In addition to the following requirements, the data escrow agreement may contain other provisions that are not contradictory or intended to subvert the required terms provided below.

PART A – TECHNICAL SPECIFICATIONS

1. **Deposits.** There will be two types of Deposits: Full and Differential. For both types, the universe of Registry objects to be considered for data escrow are those objects necessary in order to offer all of the approved Registry Services.
   1.1 “**Full Deposit**” will consist of data that reflects the state of the registry as of 00:00:00 UTC on each Sunday.
   1.2 “**Differential Deposit**” means data that reflects all transactions that were not reflected in the last previous Full or Differential Deposit, as the case may be. Each Differential Deposit will contain all database transactions since the previous Deposit was completed as of 00:00:00 UTC of each day, but Sunday. Differential Deposits must include complete Escrow Records as specified below that were not included or changed since the most recent full or Differential Deposit (i.e., newly added or modified domain names).

2. **Schedule for Deposits.** Registry Operator will submit a set of escrow files on a daily basis as follows:
   2.1 Each Sunday, a Full Deposit must be submitted to the Escrow Agent by 23:59 UTC.
   2.2 The other six days of the week, the corresponding Differential Deposit must be submitted to Escrow Agent by 23:59 UTC.

3. **Escrow Format Specification.**
   3.1 **Deposit’s Format.** Registry objects, such as domains, contacts, name servers, registrars, etc. will be compiled into a file constructed as described in draft-arias-noguchi-registry-data-escrow, see [1]. The aforementioned document describes some elements as optional; Registry Operator will include those elements in the Deposits if they are available. Registry Operator will use the draft version available at the time of signing the Agreement, if not already an RFC. Once the specification is published as an RFC, Registry Operator will implement that specification, no later than 180 days after. UTF-8 character encoding will be used.

   3.2 **Extensions.** If a Registry Operator offers additional Registry Services that require submission of additional data, not included above, additional “extension schemas” shall be defined in a case by case base to represent that data. These “extension schemas” will be specified as described in [1]. Data related to the “extensions schemas” will be included in the deposit file described in section 3.1. ICANN and the respective Registry shall work together to agree on such new objects’ data escrow specifications.
4. **Processing of Deposit files.** The use of compression is recommended in order to reduce electronic data transfer times, and storage capacity requirements. Data encryption will be used to ensure the privacy of registry escrow data. Files processed for compression and encryption will be in the binary OpenPGP format as per OpenPGP Message Format - RFC 4880, see [2]. Acceptable algorithms for Public-key cryptography, Symmetric-key cryptography, Hash and Compression are those enumerated in RFC 4880, not marked as deprecated in OpenPGP IANA Registry, see [3], that are also royalty-free. The process to follow for a data file in original text format is:

1. The file should be compressed. The suggested algorithm for compression is ZIP as per RFC 4880.
2. The compressed data will be encrypted using the escrow agent's public key. The suggested algorithms for Public-key encryption are Elgamal and RSA as per RFC 4880. The suggested algorithms for Symmetric-key encryption are TripleDES, AES128 and CAST5 as per RFC 4880.
3. The file may be split as necessary if, once compressed and encrypted is larger than the file size limit agreed with the escrow agent. Every part of a split file, or the whole file if split is not used, will be called a processed file in this section.
4. A digital signature file will be generated for every processed file using the Registry's private key. The digital signature file will be in binary OpenPGP format as per RFC 4880 [2], and will not be compressed or encrypted. The suggested algorithms for Digital signatures are DSA and RSA as per RFC 4880. The suggested algorithm for Hashes in Digital signatures is SHA256.
5. The processed files and digital signature files will then be transferred to the Escrow Agent through secure electronic mechanisms, such as, SFTP, SCP, HTTPS file upload, etc. as agreed between the Escrow Agent and the Registry Operator. Non-electronic delivery through a physical medium such as CD-ROMs, DVD-ROMs, or USB storage devices may be used if authorized by ICANN.
6. The Escrow Agent will then validate every (processed) transferred data file using the procedure described in section 8.

5. **File Naming Conventions.** Files will be named according to the following convention:

   \{_gTLD\}_{YYYY-MM-DD}_{type}\_{S\{#\}_R\{rev\}}\_{\text{ext}}\ where:

5.1 \{_gTLD\} is replaced with the gTLD name; in case of an IDN-TLD, the ASCII-compatible form (A-Label) must be used;

5.2 \{YYYY-MM-DD\} is replaced by the date corresponding to the time used as a timeline watermark for the transactions; i.e. for the Full Deposit corresponding to 2009-08-02T00:00Z, the string to be used would be “2009-08-02”;

5.3 \{type\} is replaced by:
   (1) “full”, if the data represents a Full Deposit;
   (2) “diff”, if the data represents a Differential Deposit;
   (3) “thin”, if the data represents a Bulk Registration Data Access file, as specified in section 3 of Specification 4;

5.4 \{#\} is replaced by the position of the file in a series of files, beginning with “1”; in case of a lone file, this must be replaced by “1”.

5.5 \{rev\} is replaced by the number of revision (or resend) of the file beginning with “0”:

5.6 \{ext\} is replaced by “sig” if it is a digital signature file of the quasi-homonymous file. Otherwise it is replaced by “ryde”.

29
6. **Distribution of Public Keys.** Each of Registry Operator and Escrow Agent will distribute its public key to the other party (Registry Operator or Escrow Agent, as the case may be) via email to an email address to be specified. Each party will confirm receipt of the other party’s public key with a reply email, and the distributing party will subsequently reconfirm the authenticity of the key transmitted via offline methods, like in person meeting, telephone, etc. In this way, public key transmission is authenticated to a user able to send and receive mail via a mail server operated by the distributing party. Escrow Agent, Registry and ICANN will exchange keys by the same procedure.

7. **Notification of Deposits.** Along with the delivery of each Deposit, Registry Operator will deliver to Escrow Agent and to ICANN a written statement (which may be by authenticated e-mail) that includes a copy of the report generated upon creation of the Deposit and states that the Deposit has been inspected by Registry Operator and is complete and accurate. Registry Operator will include the Deposit’s "id" and "resend" attributes in its statement. The attributes are explained in [1].

8. **Verification Procedure.**
   (1) The signature file of each processed file is validated.
   (2) If processed files are pieces of a bigger file, the latter is put together.
   (3) Each file obtained in the previous step is then decrypted and uncompressed.
   (4) Each data file contained in the previous step is then validated against the format defined in [1].
   (5) If [1] includes a verification process, that will be applied at this step.
   If any discrepancy is found in any of the steps, the Deposit will be considered incomplete.

9. **References.**
PART B – LEGAL REQUIREMENTS

1. **Escrow Agent.** Prior to entering into an escrow agreement, the Registry Operator must provide notice to ICANN as to the identity of the Escrow Agent, and provide ICANN with contact information and a copy of the relevant escrow agreement, and all amendment thereto. In addition, prior to entering into an escrow agreement, Registry Operator must obtain the consent of ICANN to (a) use the specified Escrow Agent, and (b) enter into the form of escrow agreement provided. ICANN must be expressly designated a third-party beneficiary of the escrow agreement. ICANN reserves the right to withhold its consent to any Escrow Agent, escrow agreement, or any amendment thereto, all in its sole discretion.

2. **Fees.** Registry Operator must pay, or have paid on its behalf, fees to the Escrow Agent directly. If Registry Operator fails to pay any fee by the due date(s), the Escrow Agent will give ICANN written notice of such non-payment and ICANN may pay the past-due fee(s) within ten business days after receipt of the written notice from Escrow Agent. Upon payment of the past-due fees by ICANN, ICANN shall have a claim for such amount against Registry Operator, which Registry Operator shall be required to submit to ICANN together with the next fee payment due under the Registry Agreement.

3. **Ownership.** Ownership of the Deposits during the effective term of the Registry Agreement shall remain with Registry Operator at all times. Thereafter, Registry Operator shall assign any such ownership rights (including intellectual property rights, as the case may be) in such Deposits to ICANN. In the event that during the term of the Registry Agreement any Deposit is released from escrow to ICANN, any intellectual property rights held by Registry Operator in the Deposits will automatically be licensed on a non-exclusive, perpetual, irrevocable, royalty-free, paid-up basis to ICANN or to a party designated in writing by ICANN.

4. **Integrity and Confidentiality.** Escrow Agent will be required to (i) hold and maintain the Deposits in a secure, locked, and environmentally safe facility, which is accessible only to authorized representatives of Escrow Agent, (ii) protect the integrity and confidentiality of the Deposits using commercially reasonable measures and (iii) keep and safeguard each Deposit for one year. ICANN and Registry Operator will be provided the right to inspect Escrow Agent's applicable records upon reasonable prior notice and during normal business hours. Registry Operator and ICANN will be provided with the right to designate a third-party auditor to audit Escrow Agent’s compliance with the technical specifications and maintenance requirements of this Specification 2 from time to time.

If Escrow Agent receives a subpoena or any other order from a court or other judicial tribunal pertaining to the disclosure or release of the Deposits, Escrow Agent will promptly notify the Registry Operator and ICANN unless prohibited by law. After notifying the Registry Operator and ICANN, Escrow Agent shall allow sufficient time for Registry Operator or ICANN to challenge any such order, which shall be the responsibility of Registry Operator or ICANN; provided, however, that Escrow Agent does not waive its rights to present its position with respect to any such order. Escrow Agent will cooperate with the Registry Operator or ICANN to support efforts to quash or limit any subpoena, at such party’s expense. Any party requesting additional assistance shall pay Escrow Agent’s standard charges or as quoted upon submission of a detailed request.
5. **Copies.** Escrow Agent may be permitted to duplicate any Deposit, in order to comply with the terms and provisions of the escrow agreement.

6. **Release of Deposits.** Escrow Agent will make available for electronic download (unless otherwise requested) to ICANN or its designee, within twenty-four hours, at the Registry Operator’s expense, all Deposits in Escrow Agent’s possession in the event that the Escrow Agent receives a request from Registry Operator to effect such delivery to ICANN, or receives one of the following written notices by ICANN stating that:

6.1 the Registry Agreement has expired without renewal, or been terminated; or
6.2 ICANN failed, with respect to (a) any Full Deposit or (b) five Differential Deposits within any calendar month, to receive, within five calendar days after the Deposit’s scheduled delivery date, notification of receipt from Escrow Agent; (x) ICANN gave notice to Escrow Agent and Registry Operator of that failure; and (y) ICANN has not, within seven calendar days after such notice, received notice from Escrow Agent that the Deposit has been received; or
6.3 ICANN has received notification from Escrow Agent of failed verification of a Full Deposit or of failed verification of five Differential Deposits within any calendar month and (a) ICANN gave notice to Registry Operator of that receipt; and (b) ICANN has not, within seven calendar days after such notice, received notice from Escrow Agent of verification of a remediated version of such Full Deposit or Differential Deposit; or
6.4 Registry Operator has: (i) ceased to conduct its business in the ordinary course; or (ii) filed for bankruptcy, become insolvent or anything analogous to any of the foregoing under the laws of any jurisdiction anywhere in the world; or
6.5 Registry Operator has experienced a failure of critical registry functions and ICANN has asserted its rights pursuant to Section 2.13 of the Registry Agreement; or
6.6 a competent court, arbitral, legislative, or government agency mandates the release of the Deposits to ICANN.

Unless Escrow Agent has previously released the Registry Operator’s Deposits to ICANN or its designee, Escrow Agent will deliver all Deposits to ICANN upon termination of the Registry Agreement or the Escrow Agreement.

7. **Verification of Deposits.**

7.1 Within twenty-four hours after receiving each Deposit or corrected Deposit, Escrow Agent must verify the format and completeness of each Deposit and deliver to ICANN a copy of the verification report generated for each Deposit. Reports will be delivered electronically, as specified from time to time by ICANN.

7.2 If Escrow Agent discovers that any Deposit fails the verification procedures, Escrow Agent must notify, either by email, fax or phone, Registry Operator and ICANN of such nonconformity within twenty-four hours after receiving the non-conformant Deposit. Upon notification of such verification failure, Registry Operator must begin developing modifications, updates, corrections, and other fixes of the Deposit necessary for the Deposit to pass the verification procedures and deliver such fixes to Escrow Agent as promptly as possible.

8. **Amendments.** Escrow Agent and Registry Operator shall amend the terms of the Escrow Agreement to conform to this Specification 2 within ten (10) calendar days of any amendment or modification to this Specification 2. In the event of a conflict between this Specification 2 and the Escrow Agreement, this Specification 2 shall control.

9. **Indemnity.** Registry Operator shall indemnify and hold harmless Escrow Agent and each of its directors, officers, agents, employees, members, and stockholders (“Escrow Agent Indemnitees”)
absolutely and forever from and against any and all claims, actions, damages, suits, liabilities, obligations, costs, fees, charges, and any other expenses whatsoever, including reasonable attorneys' fees and costs, that may be asserted by a third party against any Escrow Agent Indemnitees in connection with the Escrow Agreement or the performance of Escrow Agent or any Escrow Agent Indemnitees thereunder (with the exception of any claims based on the misrepresentation, negligence, or misconduct of Escrow Agent, its directors, officers, agents, employees, contractors, members, and stockholders). Escrow Agent shall indemnify and hold harmless Registry Operator and ICANN, and each of their respective directors, officers, agents, employees, members, and stockholders ("Indemnitees") absolutely and forever from and against any and all claims, actions, damages, suits, liabilities, obligations, costs, fees, charges, and any other expenses whatsoever, including reasonable attorneys' fees and costs, that may be asserted by a third party against any Indemnitee in connection with the misrepresentation, negligence or misconduct of Escrow Agent, its directors, officers, agents, employees and contractors.
**SPECIFICATION 3**

**FORMAT AND CONTENT FOR REGISTRY OPERATOR MONTHLY REPORTING**

Registry Operator shall provide one set of monthly reports per gTLD to __________ with the following content. ICANN may request in the future that the reports be delivered by other means and using other formats. ICANN will use reasonable commercial efforts to preserve the confidentiality of the information reported until three months after the end of the month to which the reports relate.

1. **Per-Registrar Transactions Report.** This report shall be compiled in a comma separated-value formatted file as specified in RFC 4180. The file shall be named “gTLD-transactions-yyyymm.csv”, where “gTLD” is the gTLD name; in case of an IDN-TLD, the A-label shall be used; “yyyymm” is the year and month being reported. The file shall contain the following fields per registrar:

<table>
<thead>
<tr>
<th>Field #</th>
<th>Field Name</th>
<th>Description</th>

The first line shall include the field names exactly as described in the table above as a “header line” as described in section 2 of RFC 4180. The last line of each report shall include totals for each column across all registrars; the first field of this line shall read “Totals” while the second field shall be left empty in that line. No other lines besides the ones described above shall be included. Line breaks shall be <U+000D, U+000A> as described in RFC 4180.
SPECIFICATION 4

SPECIFICATION FOR REGISTRATION DATA PUBLICATION SERVICES

1. **Registration Data Directory Services.** Until ICANN requires a different protocol, Registry Operator will operate a WHOIS service available via port 43 in accordance with RFC 3912, and a web-based Directory Service at <whois.nic.TLD> providing free public query-based access to at least the following elements in the following format. ICANN reserves the right to specify alternative formats and protocols, and upon such specification, the Registry Operator will implement such alternative specification as soon as reasonably practicable.

   1.1. The format of responses shall follow a semi-free text format outline below, followed by a blank line and a legal disclaimer specifying the rights of Registry Operator, and of the user querying the database.

   1.2. Each data object shall be represented as a set of key/value pairs, with lines beginning with keys, followed by a colon and a space as delimiters, followed by the value.

   1.3. For fields where more than one value exists, multiple key/value pairs with the same key shall be allowed (for example to list multiple name servers). The first key/value pair after a blank line should be considered the start of a new record, and should be considered as identifying that record, and is used to group data, such as hostnames and IP addresses, or a domain name and registrant information, together.

1.4. **Domain Name Data:**

   1.4.1. **Query format:** whois EXAMPLE.TLD

   1.4.2. **Response format:**

   Domain Name: EXAMPLE.TLD
   Domain ID: D1234567-TLD
   WHOIS Server: whois.example.tld
   Referral URL: http://www.example.tld
   Updated Date: 2009-05-29T20:13:00Z
   Creation Date: 2000-10-08T00:45:00Z
   Registry Expiry Date: 2010-10-08T00:44:59Z

>>> Last update of WHOIS database: 2009-05-29T20:15:00Z <<<

1.6. Nameserver Data:

1.6.1. **Query format:** whois "NS1.EXAMPLE.TLD" or whois "nameserver (IP Address)"

1.6.2. **Response format:**

- Server Name: NS1.EXAMPLE.TLD
- IP Address: 192.0.2.123
- IP Address: 2001:0DB8::1
- Registrar: Example Registrar, Inc.
- WHOIS Server: whois.example-registrar.tld
- Referral URL: http://www.example-registrar.tld

>>> Last update of WHOIS database: 2009-05-29T20:15:00Z <<<

1.7. The format of the following data fields: domain status, individual and organizational names, address, street, city, state/province, postal code, country, telephone and fax numbers, email addresses, date and times should conform to the mappings specified in EPP RFCs 5730-5734 so that the display of this information (or values return in WHOIS responses) can be uniformly processed and understood.

1.8. **Searchability.** Offering searchability capabilities on the Directory Services is optional but if offered by the Registry Operator it shall comply with the specification described in this section.

1.8.1. Registry Operator will offer searchability on the web-based Directory Service.

1.8.2. Registry Operator will offer partial match capabilities, at least, on the following fields: domain name, contacts and registrant’s name, and contact and registrant’s postal address, including all the sub-fields described in EPP (e.g., street, city, state or province, etc.).

1.8.3. Registry Operator will offer exact-match capabilities, at least, on the following fields: registrar id, name server name, and name server’s IP address (only applies to IP addresses stored by the registry, i.e., glue records).
1.8.4. Registry Operator will offer Boolean search capabilities supporting, at least, the following logical operators to join a set of search criteria: AND, OR, NOT.

1.8.5. Search results will include domain names matching the search criteria.

1.8.6. Registry Operator will: 1) implement appropriate measures to avoid abuse of this feature (e.g., permitting access only to legitimate authorized users); and 2) ensure the feature is in compliance with any applicable privacy laws or policies.

2. Zone File Access

2.1. Third-Party Access

2.1.1. Zone File Access Agreement. Registry Operator will enter into an agreement with any Internet user that will allow such user to access an Internet host server or servers designated by Registry Operator and download zone file data. The agreement will be standardized, facilitated and administered by a Centralized Zone Data Access Provider (the “CZDA Provider”). Registry Operator will provide access to zone file data per Section 2.1.3 and do so using the file format described in Section 2.1.4. Notwithstanding the foregoing, (a) the CZDA Provider may reject the request for access of any user that does not satisfy the credentialing requirements in Section 2.1.2 below; (b) Registry Operator may reject the request for access of any user that does not provide correct or legitimate credentials under Section 2.1.2 or where Registry Operator reasonably believes will violate the terms of Section 2.1.5 below; and, (c) Registry Operator may revoke access of any user if Registry Operator has evidence to support that the user has violated the terms of Section 2.1.5.

2.1.2. Credentialing Requirements. Registry Operator, through the facilitation of the CZDA Provider, will request each user to provide it with information sufficient to correctly identify and locate the user. Such user information will include, without limitation, company name, contact name, address, telephone number, facsimile number, email address, and the Internet host machine name and IP address.

2.1.3. Grant of Access. Each Registry Operator will provide the Zone File FTP (or other Registry supported) service for an ICANN-specified and managed URL (specifically, <TLD>.zda.icann.org where <TLD> is the TLD for which the registry is responsible) for the user to access the Registry’s zone data archives. Registry Operator will grant the user a non-exclusive, non-transferable, limited right to access Registry Operator’s Zone File FTP server, and to transfer a copy of the top-level domain zone files, and any associated cryptographic checksum files no more than once per 24 hour period using FTP, or other data transport and access protocols that may be prescribed by ICANN. For every zone file access server, the zone files are in the top-level directory called <zone>.zone.gz, with <zone>.zone.gz.md5 and <zone>.zone.gz.sig to verify downloads. If the Registry Operator also provides historical data, it will use the naming pattern <zone>-yyyymmd.zone.gz, etc.

2.1.4. File Format Standard. Registry Operator will provide zone files using a sub-format of the standard Master File format as originally defined in RFC 1035, Section 5, including all the records present in the actual zone used in the public DNS. Sub-format is as follows:

1. Each record must include all fields in one line as: <domain-name> <TTL> <class> <type> <RDATA>.
2. Class and Type must use the standard mnemonics and must be in lower case.
3. TTL must be present as a decimal integer.
4. Use of /X and /DDD inside domain names is allowed.
5. All domain names must be in lower case.
6. Must use exactly one tab as separator of fields inside a record.
7. All domain names must be fully qualified.
8. No $ORIGIN directives.
9. No use of "@" to denote current origin.
10. No use of "blank domain names" at the beginning of a record to continue the use of the domain name in the previous record.
11. No $INCLUDE directives.
12. No $TTL directives.
13. No use of parentheses, e.g., to continue the list of fields in a record across a line boundary.
14. No use of comments.
15. No blank lines.
16. The SOA record should be present at the top and (duplicated at) the end of the zone file.
17. With the exception of the SOA record, all the records in a file must be in alphabetical order.
18. One zone per file. If a TLD divides its DNS data into multiple zones, each goes into a separate file named as above, with all the files combined using tar into a file called <tld>.zone.tar.

2.1.5. Use of Data by User. Registry Operator will permit user to use the zone file for lawful purposes; provided that, (a) user takes all reasonable steps to protect against unauthorized access to and use and disclosure of the data, and (b) under no circumstances will Registry Operator be required or permitted to allow user to use the data to, (i) allow, enable, or otherwise support the transmission by e-mail, telephone, or facsimile of mass unsolicited, commercial advertising or solicitations to entities other than user’s own existing customers, or (ii) enable high volume, automated, electronic processes that send queries or data to the systems of Registry Operator or any ICANN-accredited registrar.

2.1.6. Term of Use. Registry Operator, through CZDA Provider, will provide each user with access to the zone file for a period of not less than three (3) months. Registry Operator will allow users to renew their Grant of Access.

2.1.7. No Fee for Access. Registry Operator will provide, and CZDA Provider will facilitate, access to the zone file to user at no cost.

2.2 Co-operation

2.2.1. Assistance. Registry Operator will co-operate and provide reasonable assistance to ICANN and the CZDA Provider to facilitate and maintain the efficient access of zone file data by permitted users as contemplated under this Schedule.

2.3 ICANN Access. Registry Operator shall provide bulk access to the zone files for the TLD to ICANN or its designee on a continuous basis in the manner ICANN may reasonably specify from time to time.

2.4 Emergency Operator Access. Registry Operator shall provide bulk access to the zone files for the TLD to the Emergency Operators designated by ICANN on a continuous basis in the manner ICANN may reasonably specify from time to time.
3. **Bulk Registration Data Access to ICANN**

3.1. **Periodic Access to Thin Registration Data.** In order to verify and ensure the operational stability of Registry Services as well as to facilitate compliance checks on accredited registrars, Registry Operator will provide ICANN on a weekly basis (the day to be designated by ICANN) with up-to-date Registration Data as specified below. Data will include data committed as of 00:00:00 UTC on the day previous to the one designated for retrieval by ICANN.

3.1.1. **Contents.** Registry Operator will provide, at least, the following data for all registered domain names: domain name, domain name repository object id (roid), registrar id (IANA ID), statuses, last updated date, creation date, expiration date, and name server names. For sponsoring registrars, at least, it will provide: registrar name, registrar repository object id (roid), hostname of registrar Whois server, and URL of registrar.

3.1.2. **Format.** The data will be provided in the format specified in Specification 2 for Data Escrow (including encryption, signing, etc.) but including only the fields mentioned in the previous section, i.e., the file will only contain Domain and Registrar objects with the fields mentioned above. Registry Operator has the option to provide a full deposit file instead as specified in Specification 2.

3.1.3. **Access.** Registry Operator will have the file(s) ready for download as of 00:00:00 UTC on the day designated for retrieval by ICANN. The file(s) will be made available for download by SFTP, though ICANN may request other means in the future.

3.2. **Exceptional Access to Thick Registration Data.** In case of a registrar failure, de-accreditation, court order, etc. that prompts the temporary or definitive transfer of its domain names to another registrar, at the request of ICANN, Registry Operator will provide ICANN with up-to-date data for the domain names of the losing registrar. The data will be provided in the format specified in Specification 2 for Data Escrow. The file will only contain data related to the domain names of the losing registrar. Registry Operator will provide the data within 2 business days. Unless otherwise agreed by Registry Operator and ICANN, the file will be made available for download by ICANN in the same manner as the data specified in Section 3.1. of this Specification.
SPECIFICATION 5

SCHEDULE OF RESERVED NAMES AT THE SECOND LEVEL IN GTLD REGISTRIES

Except to the extent that ICANN otherwise expressly authorizes in writing, Registry Operator shall reserve (i.e., Registry Operator shall not register, delegate, use or otherwise make available such labels to any third party, but may register such labels in its own name in order to withhold them from delegation or use) names formed with the following labels from initial (i.e. other than renewal) registration within the TLD:

1. Example. The label “EXAMPLE” shall be reserved at the second level and at all other levels within the TLD at which Registry Operator makes registrations.

2. Two-character labels. All two-character labels shall be initially reserved. The reservation of a two-character label string may be released to the extent that Registry Operator reaches agreement with the government and country-code manager. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes.

3. Tagged Domain Names. Labels may only include hyphens in the third and fourth position if they represent valid internationalized domain names in their ASCII encoding (for example "xn--ndk061n").

4. Second-Level Reservations for Registry Operations. The following names are reserved for use in connection with the operation of the registry for the TLD. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the TLD they shall be transferred as specified by ICANN: NIC, WWW, IRIS and WHOIS.

5. Country and Territory Names. The country and territory names contained in the following internationally recognized lists shall be initially reserved at the second level and at all other levels within the TLD at which the Registry Operator provides for registrations:

5.1. the short form (in English) of all country and territory names contained on the ISO 3166-1 list, as updated from time to time, including the European Union, which is exceptionally reserved on the ISO 3166-1 list, and its scope extended in August 1999 to any application needing to represent the name European Union <http://www.iso.org/iso/support/country_codes/iso_3166_code_lists/iso-3166-1_decoding_table.htm#EU>;

5.2. the United Nations Group of Experts on Geographical Names, Technical Reference Manual for the Standardization of Geographical Names, Part III Names of Countries of the World; and

provided, that the reservation of specific country and territory names may be released to the extent that Registry Operator reaches agreement with the applicable government(s), provided, further, that
Registry Operator may also propose release of these reservations, subject to review by ICANN’s Governmental Advisory Committee and approval by ICANN.
NEW GTLD AGREEMENT SPECIFICATIONS

SPECIFICATION 6

REGISTRY INTEROPERABILITY AND CONTINUITY SPECIFICATIONS

1. Standards Compliance

1.1. DNS. Registry Operator shall comply with relevant existing RFCs and those published in the future by the Internet Engineering Task Force (IETF) including all successor standards, modifications or additions thereto relating to the DNS and name server operations including without limitation RFCs 1034, 1035, 1982, 2181, 2182, 2671, 3226, 3596, 3597, 4343, and 5966.

1.2. EPP. Registry Operator shall comply with relevant existing RFCs and those published in the future by the Internet Engineering Task Force (IETF) including all successor standards, modifications or additions thereto relating to the provisioning and management of domain names using the Extensible Provisioning Protocol (EPP) in conformance with RFCs 5910, 5730, 5731, 5732, 5733 and 5734. If Registry Operator implements Registry Grace Period (RGP), it will comply with RFC 3915 and its successors. If Registry Operator requires the use of functionality outside the base EPP RFCs, Registry Operator must document EPP extensions in Internet-Draft format following the guidelines described in RFC 3735. Registry Operator will provide and update the relevant documentation of all the EPP Objects and Extensions supported to ICANN prior to deployment.

1.3. DNSSEC. Registry Operator shall sign its TLD zone files implementing Domain Name System Security Extensions (“DNSSEC”). During the Term, Registry Operator shall comply with RFCs 4033, 4034, 4035, 4509 and their successors, and follow the best practices described in RFC 4641 and its successors. If Registry Operator implements Hashed Authenticated Denial of Existence for DNS Security Extensions, it shall comply with RFC 5155 and its successors. Registry Operator shall accept public-key material from child domain names in a secure manner according to industry best practices. Registry shall also publish in its website the DNSSEC Practice Statements (DPS) describing critical security controls and procedures for key material storage, access and usage for its own keys and secure acceptance of registrants’ public-key material. Registry Operator shall publish its DPS following the format described in “DPS-framework” (currently in draft format, see http://tools.ietf.org/html/draft-ietf-dnsop-dnssec-dps-framework) within 180 days after the “DPS-framework” becomes an RFC.

1.4. IDN. If the Registry Operator offers Internationalized Domain Names (“IDNs”), it shall comply with RFCs 5890, 5891, 5892, 5893 and their successors. Registry Operator shall comply with the ICANN IDN Guidelines at <http://www.icann.org/en/topics/idn/implementation-guidelines.htm>, as they may be amended, modified, or superseded from time to time. Registry Operator shall publish and keep updated its IDN Tables and IDN Registration Rules in the IANA Repository of IDN Practices as specified in the ICANN IDN Guidelines.

1.5. IPv6. Registry Operator shall be able to accept IPv6 addresses as glue records in its Registry System and publish them in the DNS. Registry Operator shall offer public IPv6 transport for, at least, two of the Registry’s name servers listed in the root zone with the corresponding IPv6 addresses registered with IANA. Registry Operator should follow “DNS IPv6 Transport Operational Guidelines” as described in BCP 91 and the recommendations and considerations described in RFC 4472. Registry Operator shall offer public IPv6 transport for its Registration Data Publication Services as defined in Specification 4 of this Agreement; e.g. Whois (RFC 3912), Web based Whois. Registry Operator shall offer public IPv6 transport for its Shared Registration System (SRS) to any Registrar, no later than six months after receiving the first request in writing from a gTLD accredited Registrar willing to operate with the SRS over IPv6.
2. **Registry Services**

   2.1. **Registry Services.** “Registry Services” are, for purposes of the Registry Agreement, defined as the following: (a) those services that are operations of the registry critical to the following tasks: the receipt of data from registrars concerning registrations of domain names and name servers; provision to registrars of status information relating to the zone servers for the TLD; dissemination of TLD zone files; operation of the registry DNS servers; and dissemination of contact and other information concerning domain name server registrations in the TLD as required by this Agreement; (b) other products or services that the Registry Operator is required to provide because of the establishment of a Consensus Policy as defined in Specification 1; (c) any other products or services that only a registry operator is capable of providing, by reason of its designation as the registry operator; and (d) material changes to any Registry Service within the scope of (a), (b) or (c) above.

   2.2. **Wildcard Prohibition.** For domain names which are either not registered, or the registrant has not supplied valid records such as NS records for listing in the DNS zone file, or their status does not allow them to be published in the DNS, the use of DNS wildcard Resource Records as described in RFCs 1034 and 4592 or any other method or technology for synthesizing DNS Resource Records or using redirection within the DNS by the Registry is prohibited. When queried for such domain names the authoritative name servers must return a “Name Error” response (also known as NXDOMAIN), RCODE 3 as described in RFC 1035 and related RFCs. This provision applies for all DNS zone files at all levels in the DNS tree for which the Registry Operator (or an affiliate engaged in providing Registration Services) maintains data, arranges for such maintenance, or derives revenue from such maintenance.

3. **Registry Continuity**

   3.1. **High Availability.** Registry Operator will conduct its operations using network and geographically diverse, redundant servers (including network-level redundancy, end-node level redundancy and the implementation of a load balancing scheme where applicable) to ensure continued operation in the case of technical failure (widespread or local), or an extraordinary occurrence or circumstance beyond the control of the Registry Operator.

   3.2. **Extraordinary Event.** Registry Operator will use commercially reasonable efforts to restore the critical functions of the registry within 24 hours after the termination of an extraordinary event beyond the control of the Registry Operator and restore full system functionality within a maximum of 48 hours following such event, depending on the type of critical function involved. Outages due to such an event will not be considered a lack of service availability.

   3.3. **Business Continuity.** Registry Operator shall maintain a business continuity plan, which will provide for the maintenance of Registry Services in the event of an extraordinary event beyond the control of the Registry Operator or business failure of Registry Operator, and may include the designation of a Registry Services continuity provider. If such plan includes the designation of a Registry Services continuity provider, Registry Operator shall provide the name and contact information for such Registry Services continuity provider to ICANN. In the case of an extraordinary event beyond the control of the Registry Operator where the Registry Operator cannot be contacted, Registry Operator consents that ICANN may contact the designated Registry Services continuity provider, if one exists. Registry Operator shall conduct Registry Services Continuity testing at least once per year.

4. **Abuse Mitigation**
4.1. **Abuse Contact.** Registry Operator shall provide to ICANN and publish on its website its accurate contact details including a valid email and mailing address as well as a primary contact for handling inquiries related to malicious conduct in the TLD, and will provide ICANN with prompt notice of any changes to such contact details.

4.2. **Malicious Use of Orphan Glue Records.** Registry Operators shall take action to remove orphan glue records (as defined at http://www.icann.org/en/committees/security/sac048.pdf) when provided with evidence in written form that such records are present in connection with malicious conduct.

5. **Supported Initial and Renewal Registration Periods**

5.1. **Initial Registration Periods.** Initial registrations of registered names may be made in the registry in one (1) year increments for up to a maximum of ten (10) years. For the avoidance of doubt, initial registrations of registered names may not exceed ten (10) years.

5.2. **Renewal Periods.** Renewal of registered names may be made in one (1) year increments for up to a maximum of ten (10) years. For the avoidance of doubt, renewal of registered names may not extend their registration period beyond ten (10) years from the time of the renewal.
SPECIFICATION 7

MINIMUM REQUIREMENTS FOR RIGHTS PROTECTION MECHANISMS

1. Rights Protection Mechanisms. Registry Operator shall implement and adhere to any rights protection mechanisms (“RPMs”) that may be mandated from time to time by ICANN. In addition to such RPMs, Registry Operator may develop and implement additional RPMs that discourage or prevent registration of domain names that violate or abuse another party’s legal rights. Registry Operator will include all ICANN mandated and independently developed RPMs in the registry-registrar agreement entered into by ICANN-accredited registrars authorized to register names in the TLD. Registry Operator shall implement in accordance with requirements established by ICANN each of the mandatory RPMs set forth in the Trademark Clearinghouse (posted at [url to be inserted when final Trademark Clearinghouse is adopted]), which may be revised by ICANN from time to time. Registry Operator shall not mandate that any owner of applicable intellectual property rights use any other trademark information aggregation, notification, or validation service in addition to or instead of the ICANN-designated Trademark Clearinghouse.

2. Dispute Resolution Mechanisms. Registry Operator will comply with the following dispute resolution mechanisms as they may be revised from time to time:

   a. the Trademark Post-Delegation Dispute Resolution Procedure (PDDRP) and the Registration Restriction Dispute Resolution Procedure (RRDRP) adopted by ICANN (posted at [urls to be inserted when final procedure is adopted]). Registry Operator agrees to implement and adhere to any remedies ICANN imposes (which may include any reasonable remedy, including for the avoidance of doubt, the termination of the Registry Agreement pursuant to Section 4.3(c) of the Registry Agreement) following a determination by any PDDRP or RRDRP panel and to be bound by any such determination; and

   b. the Uniform Rapid Suspension system (“URS”) adopted by ICANN (posted at [url to be inserted]), including the implementation of determinations issued by URS examiners.
SPECIFICATION 8

CONTINUED OPERATIONS INSTRUMENT

1. The Continued Operations Instrument shall (a) provide for sufficient financial resources to ensure the continued operation of the critical registry functions related to the TLD set forth in Section [__] of the Applicant Guidebook posted at [url to be inserted upon finalization of Applicant Guidebook] (which is hereby incorporated by reference into this Specification 8) for a period of three (3) years following any termination of this Agreement on or prior to the fifth anniversary of the Effective Date or for a period of one (1) year following any termination of this Agreement after the fifth anniversary of the Effective Date but prior to the sixth (6th) anniversary of the Effective Date, and (b) be in the form of either (i) an irrevocable standby letter of credit, or (ii) an irrevocable cash escrow deposit, each meeting the requirements set forth in Section [__] of the Applicant Guidebook posted at [url to be inserted upon finalization of Applicant Guidebook] (which is hereby incorporated by reference into this Specification 8).

Registry Operator shall use its best efforts to take all actions necessary or advisable to maintain in effect the Continued Operations Instrument for a period of six (6) years from the Effective Date, and to maintain ICANN as a third party beneficiary thereof. Registry Operator shall provide to ICANN copies of all final documents relating to the Continued Operations Instrument and shall keep ICANN reasonably informed of material developments relating to the Continued Operations Instrument. Registry Operator shall not agree to, or permit, any amendment of, or waiver under, the Continued Operations Instrument or other documentation relating thereto without the prior written consent of ICANN (such consent not to be unreasonably withheld). The Continued Operations Instrument shall expressly state that ICANN may access the financial resources of the Continued Operations Instrument pursuant to Section 2.13 or Section 4.5 [insert for government entity: or Section 7.14] of the Registry Agreement.

2. If, notwithstanding the use of best efforts by Registry Operator to satisfy its obligations under the preceding paragraph, the Continued Operations Instrument expires or is terminated by another party thereto, in whole or in part, for any reason, prior to the sixth anniversary of the Effective Date, Registry Operator shall promptly (i) notify ICANN of such expiration or termination and the reasons therefor and (ii) arrange for an alternative instrument that provides for sufficient financial resources to ensure the continued operation of the Registry Services related to the TLD for a period of three (3) years following any termination of this Agreement on or prior to the fifth anniversary of the Effective Date or for a period of one (1) year following any termination of this Agreement after the fifth anniversary of the Effective Date but prior to or on the sixth (6) anniversary of the Effective Date (an “Alternative Instrument”). Any such Alternative Instrument shall be on terms no less favorable to ICANN than the Continued Operations Instrument and shall otherwise be in form and substance reasonably acceptable to ICANN.

3. Notwithstanding anything to the contrary contained in this Specification 8, at any time, Registry Operator may replace the Continued Operations Instrument with an alternative...
instrument that (i) provides for sufficient financial resources to ensure the continued operation of the Registry Services related to the TLD for a period of three (3) years following any termination of this Agreement on or prior to the fifth anniversary of the Effective Date or for a period one (1) year following any termination of this Agreement after the fifth anniversary of the Effective Date but prior to or on the sixth (6) anniversary of the Effective Date, and (ii) contains terms no less favorable to ICANN than the Continued Operations Instrument and is otherwise in form and substance reasonably acceptable to ICANN. In the event Registry Operation replaces the Continued Operations Instrument either pursuant to paragraph 2 or this paragraph 3, the terms of this Specification 8 shall no longer apply with respect to the original Continuing Operations Instrument, but shall thereafter apply with respect to such replacement instrument(s).
SPECIFICATION 9

Registry Operator Code of Conduct

1. In connection with the operation of the registry for the TLD, Registry Operator will not, and will not allow any parent, subsidiary, Affiliate, subcontractor or other related entity, to the extent such party is engaged in the provision of Registry Services with respect to the TLD (each, a “Registry Related Party”), to:

   a. directly or indirectly show any preference or provide any special consideration to any registrar with respect to operational access to registry systems and related registry services, unless comparable opportunities to qualify for such preferences or considerations are made available to all registrars on substantially similar terms and subject to substantially similar conditions;

   b. register domain names in its own right, except for names registered through an ICANN accredited registrar that are reasonably necessary for the management, operations and purpose of the TLD, provided, that Registry Operator may reserve names from registration pursuant to Section 2.6 of the Registry Agreement;

   c. register names in the TLD or sub-domains of the TLD based upon proprietary access to information about searches or resolution requests by consumers for domain names not yet registered (commonly known as, "front-running");

   d. allow any Affiliated registrar to disclose user data to Registry Operator or any Registry Related Party, except as necessary for the management and operations of the TLD, unless all unrelated third parties (including other registry operators) are given equivalent access to such user data on substantially similar terms and subject to substantially similar conditions; or

   e. disclose confidential registry data or confidential information about its Registry Services or operations to any employee of any DNS services provider, except as necessary for the management and operations of the TLD, unless all unrelated third parties (including other registry operators) are given equivalent access to such confidential registry data or confidential information on substantially similar terms and subject to substantially similar conditions.

2. If Registry Operator or a Registry Related Party also operates as a provider of registrar or registrar-reseller services, Registry Operator will, or will cause such Registry Related Party to, ensure that such services are offered through a legal entity separate from Registry Operator, and maintain separate books of accounts with respect to its registrar or registrar-reseller operations.

3. Registry Operator will conduct internal reviews at least once per calendar year to
ensure compliance with this Code of Conduct. Within twenty (20) calendar days following the end of each calendar year, Registry Operator will provide the results of the internal review, along with a certification executed by an executive officer of Registry Operator certifying as to Registry Operator’s compliance with this Code of Conduct, via email to an address to be provided by ICANN. (ICANN may specify in the future the form and contents of such reports or that the reports be delivered by other reasonable means.) Registry Operator agrees that ICANN may publicly post such results and certification.

4. Nothing set forth herein shall: (i) limit ICANN from conducting investigations of claims of Registry Operator’s non-compliance with this Code of Conduct; or (ii) provide grounds for Registry Operator to refuse to cooperate with ICANN investigations of claims of Registry Operator’s non-compliance with this Code of Conduct.

5. Nothing set forth herein shall limit the ability of Registry Operator or any Registry Related Party, to enter into arms-length transactions in the ordinary course of business with a registrar or reseller with respect to products and services unrelated in all respects to the TLD.

6. Registry Operator may request an exemption to this Code of Conduct, and such exemption may be granted by ICANN in ICANN’s reasonable discretion, if Registry Operator demonstrates to ICANN’s reasonable satisfaction that (i) all domain name registrations in the TLD are registered to, and maintained by, Registry Operator for its own exclusive use, (ii) Registry Operator does not sell, distribute or transfer control or use of any registrations in the TLD to any third party that is not an Affiliate of Registry Operator, and (iii) application of this Code of Conduct to the TLD is not necessary to protect the public interest.
SPECIFICATION 10

REGISTRY PERFORMANCE SPECIFICATIONS

1. Definitions

1.1. DNS. Refers to the Domain Name System as specified in RFCs 1034, 1035, and related RFCs.

1.2. DNSSEC proper resolution. There is a valid DNSSEC chain of trust from the root trust anchor to a particular domain name, e.g., a TLD, a domain name registered under a TLD, etc.

1.3. EPP. Refers to the Extensible Provisioning Protocol as specified in RFC 5730 and related RFCs.

1.4. IP address. Refers to IPv4 or IPv6 addresses without making any distinction between the two. When there is need to make a distinction, IPv4 or IPv6 is used.

1.5. Probes. Network hosts used to perform (DNS, EPP, etc.) tests (see below) that are located at various global locations.

1.6. RDDS. Registration Data Directory Services refers to the collective of WHOIS and Web-based WHOIS services as defined in Specification 4 of this Agreement.

1.7. RTT. Round-Trip Time or RTT refers to the time measured from the sending of the first bit of the first packet of the sequence of packets needed to make a request until the reception of the last bit of the last packet of the sequence needed to receive the response. If the client does not receive the whole sequence of packets needed to consider the response as received, the request will be considered unanswered.

1.8. SLR. Service Level Requirement is the level of service expected for a certain parameter being measured in a Service Level Agreement (SLA).

2. Service Level Agreement Matrix

</tbody>
</table>
Registry Operator is encouraged to do maintenance for the different services at the times and dates of statistically lower traffic for each service. However, note that there is no provision for planned outages or similar; any downtime, be it for maintenance or due to system failures, will be noted simply as downtime and counted for SLA purposes.

3. **DNS**

3.1. **DNS service availability.** Refers to the ability of the group of listed-as-authoritative name servers of a particular domain name (e.g., a TLD), to answer DNS queries from DNS probes. For the service to be considered available at a particular moment, at least, two of the delegated name servers registered in the DNS must have successful results from “DNS tests” to each of their public-DNS registered “IP addresses” to which the name server resolves. If 51% or more of the DNS testing probes see the service as unavailable during a given time, the DNS service will be considered unavailable.

3.2. **DNS name server availability.** Refers to the ability of a public-DNS registered “IP address” of a particular name server listed as authoritative for a domain name, to answer DNS queries from an Internet user. All the public DNS-registered “IP address” of all name servers of the domain name being monitored shall be tested individually. If 51% or more of the DNS testing probes get undefined/unanswered results from “DNS tests” to a name server “IP address” during a given time, the name server “IP address” will be considered unavailable.

3.3. **UDP DNS resolution RTT.** Refers to the RTT of the sequence of two packets, the UDP DNS query and the corresponding UDP DNS response. If the RTT is 5 times greater than the time specified in the relevant SLR, the RTT will be considered undefined.

3.4. **TCP DNS resolution RTT.** Refers to the RTT of the sequence of packets from the start of the TCP connection to its end, including the reception of the DNS response for only one DNS query. If the RTT is 5 times greater than the time specified in the relevant SLR, the RTT will be considered undefined.

3.5. **DNS resolution RTT.** Refers to either “UDP DNS resolution RTT” or “TCP DNS resolution RTT”.

3.6. **DNS update time.** Refers to the time measured from the reception of an EPP confirmation to a transform command on a domain name, until the name servers of the parent domain name answer “DNS queries” with data consistent with the change made. This only applies for changes to DNS information.

3.7. **DNS test.** Means one non-recursive DNS query sent to a particular “IP address” (via UDP or TCP). If DNSSEC is offered in the queried DNS zone, for a query to be considered answered, the signatures must be positively verified against a corresponding DS record published in the parent zone or, if the parent is not signed, against a statically configured Trust Anchor. The answer to the query must contain the corresponding information from the Registry System, otherwise the query will be considered unanswered. A query with a “DNS resolution RTT” 5 times higher than the corresponding SLR, will be considered unanswered. The possible results to a DNS test are: a number in milliseconds corresponding to the “DNS resolution RTT” or, undefined/unanswered.

3.8. **Measuring DNS parameters.** Every minute, every DNS probe will make an UDP or TCP “DNS test” to each of the public-DNS registered “IP addresses” of the name servers of the domain
name being monitored. If a “DNS test” result is undefined/unanswered, the tested IP will be considered unavailable from that probe until it is time to make a new test.

3.9. **Collating the results from DNS probes.** The minimum number of active testing probes to consider a measurement valid is 20 at any given measurement period, otherwise the measurements will be discarded and will be considered inconclusive; during this situation no fault will be flagged against the SLRs.

3.10. **Distribution of UDP and TCP queries.** DNS probes will send UDP or TCP “DNS test” approximating the distribution of these queries.

3.11. **Placement of DNS probes.** Probes for measuring DNS parameters shall be placed as near as possible to the DNS resolvers on the networks with the most users across the different geographic regions; care shall be taken not to deploy probes behind high propagation-delay links, such as satellite links.

4. **RDDS**

4.1. **RDDS availability.** Refers to the ability of all the RDDS services for the TLD, to respond to queries from an Internet user with appropriate data from the relevant Registry System. If 51% or more of the RDDS testing probes see any of the RDDS services as unavailable during a given time, the RDDS will be considered unavailable.

4.2. **WHOIS query RTT.** Refers to the RTT of the sequence of packets from the start of the TCP connection to its end, including the reception of the WHOIS response. If the RTT is 5-times or more the corresponding SLR, the RTT will be considered undefined.

4.3. **Web-based-WHOIS query RTT.** Refers to the RTT of the sequence of packets from the start of the TCP connection to its end, including the reception of the HTTP response for only one HTTP request. If Registry Operator implements a multiple-step process to get to the information, only the last step shall be measured. If the RTT is 5-times or more the corresponding SLR, the RTT will be considered undefined.

4.4. **RDDS query RTT.** Refers to the collective of “WHOIS query RTT” and “Web-based-WHOIS query RTT”.

4.5. **RDDS update time.** Refers to the time measured from the reception of an EPP confirmation to a transform command on a domain name, host or contact, up until the servers of the RDDS services reflect the changes made.

4.6. **RDDS test.** Means one query sent to a particular “IP address” of one of the servers of one of the RDDS services. Queries shall be about existing objects in the Registry System and the responses must contain the corresponding information otherwise the query will be considered unanswered. Queries with an RTT 5 times higher than the corresponding SLR will be considered as unanswered. The possible results to an RDDS test are: a number in milliseconds corresponding to the RTT or undefined/unanswered.

4.7. **Measuring RDDS parameters.** Every 5 minutes, RDDS probes will select one IP address from all the public-DNS registered “IP addresses” of the servers for each RDDS service of the TLD being monitored and make an “RDDS test” to each one. If an “RDDS test” result is
undefined/unanswered, the corresponding RDDS service will be considered as unavailable from that probe until it is time to make a new test.

4.8. **Collating the results from RDDS probes.** The minimum number of active testing probes to consider a measurement valid is 10 at any given measurement period, otherwise the measurements will be discarded and will be considered inconclusive; during this situation no fault will be flagged against the SLRs.

4.9. **Placement of RDDS probes.** Probes for measuring RDDS parameters shall be placed inside the networks with the most users across the different geographic regions; care shall be taken not to deploy probes behind high propagation-delay links, such as satellite links.

5. **EPP**

5.1. **EPP service availability.** Refers to the ability of the TLD EPP servers as a group, to respond to commands from the Registry accredited Registrars, who already have credentials to the servers. The response shall include appropriate data from the Registry System. An EPP command with “EPP command RTT” 5 times higher than the corresponding SLR will be considered unanswered. If 51% or more of the EPP testing probes see the EPP service as unavailable during a given time, the EPP service will be considered unavailable.

5.2. **EPP session-command RTT.** Refers to the RTT of the sequence of packets that includes the sending of a session command plus the reception of the EPP response for only one EPP session command. For the login command it will include packets needed for starting the TCP session. For the logout command it will include packets needed for closing the TCP session. EPP session commands are those described in section 2.9.1 of EPP RFC 5730. If the RTT is 5 times or more the corresponding SLR, the RTT will be considered undefined.

5.3. **EPP query-command RTT.** Refers to the RTT of the sequence of packets that includes the sending of a query command plus the reception of the EPP response for only one EPP query command. It does not include packets needed for the start or close of either the EPP or the TCP session. EPP query commands are those described in section 2.9.2 of EPP RFC 5730. If the RTT is 5-times or more the corresponding SLR, the RTT will be considered undefined.

5.4. **EPP transform-command RTT.** Refers to the RTT of the sequence of packets that includes the sending of a transform command plus the reception of the EPP response for only one EPP transform command. It does not include packets needed for the start or close of either the EPP or the TCP session. EPP transform commands are those described in section 2.9.3 of EPP RFC 5730. If the RTT is 5 times or more the corresponding SLR, the RTT will be considered undefined.

5.5. **EPP command RTT.** Refers to “EPP session-command RTT”, “EPP query-command RTT” or “EPP transform-command RTT”.

5.6. **EPP test.** Means one EPP command sent to a particular “IP address” for one of the EPP servers. Query and transform commands, with the exception of “create”, shall be about existing objects in the Registry System. The response shall include appropriate data from the Registry System. The possible results to an EPP test are: a number in milliseconds corresponding to the “EPP command RTT” or undefined/unanswered.
5.7. **Measuring EPP parameters.** Every 5 minutes, EPP probes will select one “IP address” of the EPP servers of the TLD being monitored and make an “EPP test”; every time they should alternate between the 3 different types of commands and between the commands inside each category. If an “EPP test” result is undefined/unanswered, the EPP service will be considered as unavailable from that probe until it is time to make a new test.

5.8. **Collating the results from EPP probes.** The minimum number of active testing probes to consider a measurement valid is 5 at any given measurement period, otherwise the measurements will be discarded and will be considered inconclusive; during this situation no fault will be flagged against the SLRs.

5.9. **Placement of EPP probes.** Probes for measuring EPP parameters shall be placed inside or close to Registrars points of access to the Internet across the different geographic regions; care shall be taken not to deploy probes behind high propagation-delay links, such as satellite links.

6. **Emergency Thresholds**

The following matrix presents the Emergency Thresholds that, if reached by any of the services mentioned above for a TLD, would cause the Emergency Transition of the Critical Functions as specified in Section 2.13. of this Agreement.

<table>
<thead>
<tr>
<th>Critical Function</th>
<th>Emergency Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS service (all servers)</td>
<td>4-hour downtime / week</td>
</tr>
<tr>
<td>DNSSEC proper resolution</td>
<td>4-hour downtime / week</td>
</tr>
<tr>
<td>EPP</td>
<td>24-hour downtime / week</td>
</tr>
<tr>
<td>RDDS (WHOIS/Web-based WHOIS)</td>
<td>24-hour downtime / week</td>
</tr>
<tr>
<td>Data Escrow</td>
<td>Breach of the Registry Agreement caused by missing escrow deposits as described in Specification 2, Part B, Section 6.</td>
</tr>
</tbody>
</table>

7. **Emergency Escalation**

Escalation is strictly for purposes of notifying and investigating possible or potential issues in relation to monitored services. The initiation of any escalation and the subsequent cooperative investigations do not in themselves imply that a monitored service has failed its performance requirements.

Escalations shall be carried out between ICANN and Registry Operators, Registrars and Registry Operator, and Registrars and ICANN. Registry Operators and ICANN must provide said emergency operations departments. Current contacts must be maintained between ICANN and Registry Operators and published to Registrars, where relevant to their role in escalations, prior to any processing of an Emergency Escalation by all related parties, and kept current at all times.

7.1. **Emergency Escalation initiated by ICANN**

Upon reaching 10% of the Emergency thresholds as described in Section 6, ICANN’s emergency operations will initiate an Emergency Escalation with the relevant Registry Operator. An Emergency Escalation consists of the following minimum elements: electronic (i.e., email or SMS) and/or voice contact notification to the Registry Operator’s emergency operations department with detailed information concerning the issue being escalated, including evidence of monitoring failures, cooperative trouble-shooting of the monitoring failure between ICANN staff and the Registry Operator, and the
commitment to begin the process of rectifying issues with either the monitoring service or the service being monitoring.

7.2. **Emergency Escalation initiated by Registrars**

Registry Operator will maintain an emergency operations departments prepared to handle emergency requests from registrars. In the event that a registrar is unable to conduct EPP transactions with the Registry because of a fault with the Registry Service and is unable to either contact (through ICANN mandated methods of communication) the Registry Operator, or the Registry Operator is unable or unwilling to address the fault, the registrar may initiate an Emergency Escalation to the emergency operations department of ICANN. ICANN then may initiate an Emergency Escalation with the Registry Operator as explained above.

7.3. **Notifications of Outages and Maintenance**

In the event that a Registry Operator plans maintenance, they will provide related notice to the ICANN emergency operations department, at least, 24 hours ahead of that maintenance. ICANN’s emergency operations department will note planned maintenance times, and suspend Emergency Escalation services for the monitored services during the expected maintenance outage period.

If Registry Operator declares an outage, as per their contractual obligations with ICANN, on services under SLA and performance requirements, it will notify the ICANN emergency operations department. During that declared outage, ICANN’s emergency operations department will note and suspend Emergency Escalation services for the monitored services involved.

8. **Covenants of Performance Measurement**

8.1. **No interference.** Registry Operator shall not interfere with measurement **Probes**, including any form of preferential treatment of the requests for the monitored services. Registry Operator shall respond to the measurement tests described in this Specification as it would do with any other request from Internet users (for DNS and RDDS) or registrars (for EPP).

8.2. **ICANN testing registrar.** Registry Operator agrees that ICANN will have a testing registrar used for purposes of measuring the **SLRs** described above. Registry Operator agrees to not provide any differentiated treatment for the testing registrar other than no billing of the transactions. ICANN shall not use the registrar for registering domain names (or other registry objects) for itself or others, except for the purposes of verifying contractual compliance with the conditions described in this Agreement.
1. PURPOSE OF CLEARINGHOUSE

1.1 The Trademark Clearinghouse is a central repository for information to be authenticated, stored, and disseminated, pertaining to the rights of trademark holders. ICANN will enter into an arms-length contract with service provider or providers, awarding the right to serve as a Trademark Clearinghouse Service Provider, i.e., to accept, authenticate, validate and facilitate the transmission of information related to certain trademarks.

1.2 The Clearinghouse will be required to separate its two primary functions: (i) authentication and validation of the trademarks in the Clearinghouse; and (ii) serving as a database to provide information to the new gTLD registries to support pre-launch Sunrise or Trademark Claims Services. Whether the same provider could serve both functions or whether two providers will be determined in the tender process.

1.3 The Registry shall only need to connect with one centralized database to obtain the information it needs to conduct its Sunrise or Trademark Claims Services regardless of the details of the Trademark Clearinghouse Service Provider’s contract(s) with ICANN.

1.4 Trademark Clearinghouse Service Provider may provide ancillary services, as long as those services and any data used for those services are kept separate from the Clearinghouse database.

1.5 The Clearinghouse database will be a repository of authenticated information and disseminator of the information to a limited number of recipients. Its functions will be performed in accordance with a limited charter, and will not have any discretionary powers other than what will be set out in the charter with respect to authentication and validation. The Clearinghouse administrator(s) cannot create policy. Before material changes are made to the Clearinghouse functions, they will be reviewed through the ICANN public participation model.

1.6 Inclusion in the Clearinghouse is not proof of any right, nor does it create any legal rights. Failure to submit trademarks into the Clearinghouse should not be perceived to be lack of vigilance by trademark holders or a waiver of any rights, nor can any negative influence be drawn from such failure.

2. SERVICE PROVIDERS

2.1 The selection of Trademark Clearinghouse Service Provider(s) will be subject to predetermined criteria, but the foremost considerations will be the ability to store, authenticate, validate and disseminate the data at the highest level of technical stability
and security without interference with the integrity or timeliness of the registration process or registry operations.

2.2 Functions – Authentication/Validation; Database Administration. Public commentary has suggested that the best way to protect the integrity of the data and to avoid concerns that arise through sole-source providers would be to separate the functions of database administration and data authentication/validation.

2.2.1 One entity will authenticate registrations ensuring the word marks qualify as registered or are court-validated word marks or word marks that are protected by statute or treaty. This entity would also be asked to ensure that proof of use of marks is provided, which can be demonstrated by furnishing a signed declaration and one specimen of current use.

2.2.2 The second entity will maintain the database and provide Sunrise and Trademark Claims Services (described below).

2.3 Discretion will be used, balancing effectiveness, security and other important factors, to determine whether ICANN will contract with one or two entities - one to authenticate and validate, and the other to, administer in order to preserve integrity of the data.

2.4 Contractual Relationship.

2.4.1 The Clearinghouse shall be separate and independent from ICANN. It will operate based on market needs and collect fees from those who use its services. ICANN may coordinate or specify interfaces used by registries and registrars, and provide some oversight or quality assurance function to ensure rights protection goals are appropriately met.

2.4.2 The Trademark Clearinghouse Service Provider(s) (authenticator/validator and administrator) will be selected through an open and transparent process to ensure low costs and reliable, consistent service for all those utilizing the Clearinghouse services.

2.4.3 The Service Provider(s) providing the authentication of the trademarks submitted into the Clearinghouse shall adhere to rigorous standards and requirements that would be specified in an ICANN contractual agreement.

2.4.4 The contract shall include service level requirements, customer service availability (with the goal of seven days per week, 24 hours per day, 365 days per year), data escrow requirements, and equal access requirements for all persons and entities required to access the Trademark Clearinghouse database.
2.4.5 To the extent practicable, the contract should also include indemnification by Service Provider for errors such as false positives for participants such as Registrars, ICANN, Registrants and Registrars.

2.5. Service Provider Requirements. The Clearinghouse Service Provider(s) should utilize regional marks authentication service providers (whether directly or through subcontractors) to take advantage of local experts who understand the nuances of the trademark in question. Examples of specific performance criteria details in the contract award criteria and service-level-agreements are:

2.5.1 provide 24 hour accessibility seven days a week (database administrator);
2.5.2 employ systems that are technically reliable and secure (database administrator);
2.5.3 use globally accessible and scalable systems so that multiple marks from multiple sources in multiple languages can be accommodated and sufficiently cataloged (database administrator and validator);
2.5.4 accept submissions from all over the world - the entry point for trademark holders to submit their data into the Clearinghouse database could be regional entities or one entity;
2.5.5 allow for multiple languages, with exact implementation details to be determined;
2.5.6 provide access to the Registrants to verify and research Trademark Claims Notices;
2.5.7 have the relevant experience in database administration, validation or authentication, as well as accessibility to and knowledge of the various relevant trademark laws (database administrator and authenticator); and
2.5.8 ensure through performance requirements, including those involving interface with registries and registrars, that neither domain name registration timeliness, nor registry or registrar operations will be hindered (database administrator).

3. CRITERIA FOR TRADEMARK INCLUSION IN CLEARINGHOUSE

3.1 The trademark holder will submit to one entity – a single entity for entry will facilitate access to the entire Clearinghouse database. If regional entry points are used, ICANN will publish an information page describing how to locate regional submission points. Regardless of the entry point into the Clearinghouse, the authentication procedures established will be uniform.

3.2 The standards for inclusion in the Clearinghouse are:

3.2.1 Nationally or regionally registered word marks from all jurisdictions.
3.2.2 Any word mark that has been validated through a court of law or other judicial proceeding.
3.2.3 Any word mark protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion.

3.2.4 Other marks that constitute intellectual property.

3.2.5 Protections afforded to trademark registrations do not extend to applications for registrations, marks within any opposition period or registered marks that were the subject of successful invalidation, cancellation or rectification proceedings.

3.3 The type of data supporting entry of a registered word mark into the Clearinghouse must include a copy of the registration or the relevant ownership information, including the requisite registration number(s), the jurisdictions where the registrations have issued, and the name of the owner of record.

3.4 Data supporting entry of a judicially validated word mark into the Clearinghouse must include the court documents, properly entered by the court, evidencing the validation of a given word mark.

3.5 Data supporting entry into the Clearinghouse of word marks protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion, must include a copy of the relevant portion of the statute or treaty and evidence of its effective date.

3.6 Data supporting entry into the Clearinghouse of marks that constitute intellectual property of types other than those set forth in sections 3.2.1-3.2.3 above shall be determined by the registry operator and the Clearinghouse based on the services any given registry operator chooses to provide.

3.7 Registrations that include top level extensions such as “icann.org” or “.icann” as the word mark will not be permitted in the Clearinghouse regardless of whether that mark has been registered or it has been otherwise validated or protected (e.g., if a mark existed for icann.org or .icann, neither will not be permitted in the Clearinghouse).

3.8 All mark holders seeking to have their marks included in the Clearinghouse will be required to submit a declaration, affidavit, or other sworn statement that the information provided is true and current and has not been supplied for an improper purpose. The mark holder will also be required to attest that it will keep the information supplied to the Clearinghouse current so that if, during the time the mark is included in the Clearinghouse, a registration gets cancelled or is transferred to another entity, or in the case of a court- or Clearinghouse-validated mark the holder abandons use of the mark, the mark holder has an affirmative obligation to notify the Clearinghouse. There will be penalties for failing to keep information current. Moreover, it is anticipated that there will be a process whereby registrations can be
removed from the Clearinghouse if it is discovered that the marks are procured by fraud or if the data is inaccurate.

3.9 As an additional safeguard, the data will have to be renewed periodically by any mark holder wishing to remain in the Clearinghouse. Electronic submission should facilitate this process and minimize the cost associated with it. The reason for periodic authentication is to streamline the efficiencies of the Clearinghouse and the information the registry operators will need to process and limit the marks at issue to the ones that are in use.

4. USE OF CLEARINGHOUSE DATA

4.1 All mark holders seeking to have their marks included in the Clearinghouse will have to consent to the use of their information by the Clearinghouse. However, such consent would extend only to use in connection with the stated purpose of the Trademark Clearinghouse Database for Sunrise or Trademark Claims services. The reason for such a provision would be to presently prevent the Clearinghouse from using the data in other ways without permission. There shall be no bar on the Trademark Clearinghouse Service Provider or other third party service providers providing ancillary services on a non-exclusive basis.

4.2 In order not to create a competitive advantage, the data in the Trademark Clearinghouse should be licensed to competitors interested in providing ancillary services on equal and non-discriminatory terms and on commercially reasonable terms if the mark holders agree. Accordingly, two licensing options will be offered to the mark holder: (a) a license to use its data for all required features of the Trademark Clearinghouse, with no permitted use of such data for ancillary services either by the Trademark Clearinghouse Service Provider or any other entity; or (b) license to use its data for the mandatory features of the Trademark Clearinghouse and for any ancillary uses reasonably related to the protection of marks in new gTLDs, which would include a license to allow the Clearinghouse to license the use and data in the Trademark Clearinghouse to competitors that also provide those ancillary services. The specific implementation details will be determined, and all terms and conditions related to the provision of such services shall be included in the Trademark Clearinghouse Service Provider’s contract with ICANN and subject to ICANN review.

4.3 Access by a prospective registrant to verify and research Trademark Claims Notices shall not be considered an ancillary service, and shall be provided at no cost to the Registrant. Misuse of the data by the service providers would be grounds for immediate termination.
5. DATA AUTHENTICATION AND VALIDATION GUIDELINES

5.1 One core function for inclusion in the Clearinghouse would be to authenticate that the data meets certain minimum criteria. As such, the following minimum criteria are suggested:

5.1.1 An acceptable list of data authentication sources, i.e. the web sites of patent and trademark offices throughout the world, third party providers who can obtain information from various trademark offices;

5.1.2 Name, address and contact information of the applicant is accurate, current and matches that of the registered owner of the trademarks listed;

5.1.3 Electronic contact information is provided and accurate;

5.1.4 The registration numbers and countries match the information in the respective trademark office database for that registration number.

5.2 For validation of marks by the Clearinghouse that were not protected via a court, statute or treaty, the mark holder shall be required to provide evidence of use of the mark in connection with the bona fide offering for sale of goods or services prior to application for inclusion in the Clearinghouse. Acceptable evidence of use will be a signed declaration and a single specimen of current use, which might consist of labels, tags, containers, advertising, brochures, screen shots, or something else that evidences current use.

6. MANDATORY RIGHTS PROTECTION MECHANISMS

All new gTLD registries will be required to use the Trademark Clearinghouse to support its pre-launch or initial launch period rights protection mechanisms (RPMs). These RPMs, at a minimum, must consist of a Trademark Claims service and a Sunrise process.

6.1 Trademark Claims service

6.1.1 New gTLD Registry Operators must provide Trademark Claims services during an initial launch period for marks in the Trademark Clearinghouse. This launch period must occur for at least the first 60 days that registration is open for general registration.

6.1.2 A Trademark Claims service is intended to provide clear notice to the prospective registrant of the scope of the mark holder’s rights in order to minimize the chilling effect on registrants (Trademark Claims Notice). A form that describes the required elements is attached. The specific statement by
prospective registrant warrants that: (i) the prospective registrant has received notification that the mark(s) is included in the Clearinghouse; (ii) the prospective registrant has received and understood the notice; and (iii) to the best of the prospective registrant’s knowledge, the registration and use of the requested domain name will not infringe on the rights that are the subject of the notice.

6.1.3 The Trademark Claims Notice should provide the prospective registrant access to the Trademark Clearinghouse Database information referenced in the Trademark Claims Notice to enhance understanding of the Trademark rights being claimed by the trademark holder. These links (or other sources) shall be provided in real time without cost to the prospective registrant. Preferably, the Trademark Claims Notice should be provided in the language used for the rest of the interaction with the registrar or registry, but it is anticipated that at the very least in the most appropriate UN-sponsored language (as specified by the prospective registrant or registrar/registry).

6.1.4 If the domain name is registered in the Clearinghouse, the registrar (again through an interface with the Clearinghouse) will promptly notify the mark holders(s) of the registration after it is effectuated.

6.1.5 The Trademark Clearinghouse Database will be structured to report to registries when registrants are attempting to register a domain name that is considered an “or omitted; (b) only certain special characters contained within a trademark are spelled out with appropriate words describing it (@ and &); (c) punctuation or special characters contained within a mark that are unable to be used in a second-level domain name may either be (i) omitted or (ii) replaced by spaces, hyphens or underscores and still be considered identical matches; and (d) no plural and no “marks contained” would qualify for inclusion. Identical Match” with the mark in the Clearinghouse. “Identical Match” means that the domain name consists of the complete and identical textual elements of the mark. In this regard: (a) spaces contained within a mark that are either replaced by hyphens (and vice versa)

6.2 Sunrise service

6.2.1 Sunrise registration services must be offered for a minimum of 30 days during the pre-launch phase and notice must be provided to all trademark holders in the Clearinghouse if someone is seeking a sunrise registration. This notice will be provided to holders of marks in the Clearinghouse that are an Identical Match to the name to be registered during Sunrise.

6.2.2 Sunrise Registration Process. For a Sunrise service, sunrise eligibility requirements (SERs) will be met as a minimum requirement, verified by Clearinghouse data, and
incorporate a Sunrise Dispute Resolution Policy (SDRP).

6.2.3 The proposed SERs include: (i) ownership of a mark (that satisfies the criteria in section 7.2 below), (ii) optional registry elected requirements re: international class of goods or services covered by registration; (iii) representation that all provided information is true and correct; and (iv) provision of data sufficient to document rights in the trademark.

6.2.4 The proposed SDRP must allow challenges based on at least the following four grounds: (i) at time the challenged domain name was registered, the registrant did not hold a trademark registration of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty; (ii) the domain name is not identical to the mark on which the registrant based its Sunrise registration; (iii) the trademark registration on which the registrant based its Sunrise registration is not of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty; or (iv) the trademark registration on which the domain name registrant based its Sunrise registration did not issue on or before the effective date of the Registry Agreement and was not applied for on or before ICANN announced the applications received.

6.2.5 The Clearinghouse will maintain the SERs, validate and authenticate marks, as applicable, and hear challenges.

7. PROTECTION FOR MARKS IN CLEARINGHOUSE

The scope of registered marks that must be honored by registries in providing Trademarks Claims services is broader than those that must be honored by registries in Sunrise services.

7.1 For Trademark Claims services - Registries must recognize and honor all word marks that have been or are: (i) nationally or regionally registered; (ii) court-validated; or (iii) specifically protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion. No demonstration of use is required.

7.2 For Sunrise services - Registries must recognize and honor all word marks: (i) nationally or regionally registered and for which proof of use – which can be a declaration and a single specimen of current use – was submitted to, and validated by, the Trademark Clearinghouse; or (ii) that have been court-validated; or (iii) that are specifically protected by a statute or treaty currently in effect and that was in effect on or before 26 June 2008.

8. COSTS OF CLEARINGHOUSE

Costs should be completely borne by the parties utilizing the services. Trademark holders will pay to register the Clearinghouse, and registries will pay for Trademark Claims and Sunrise services. Registrars and others who avail themselves of Clearinghouse services will pay the Clearinghouse directly.
TRADEMARK NOTICE

[In English and the language of the registration agreement]

You have received this Trademark Notice because you have applied for a domain name which matches at least one trademark record submitted to the Trademark Clearinghouse.

You may or may not be entitled to register the domain name depending on your intended use and whether it is the same or significantly overlaps with the trademarks listed below. Your rights to register this domain name may or may not be protected as noncommercial use or “fair use” by the laws of your country. (in bold italics or all caps)

Please read the trademark information below carefully, including the trademarks, jurisdictions, and goods and service for which the trademarks are registered. Please be aware that not all jurisdictions review trademark applications closely, so some of the trademark information below may exist in a national or regional registry which does not conduct a thorough or substantive review of trademark rights prior to registration.

If you have questions, you may want to consult an attorney or legal expert on trademarks and intellectual property for guidance.

If you continue with this registration, you represent that, you have received and you understand this notice and to the best of your knowledge, your registration and use of the requested domain name will not infringe on the trademark rights listed below. The following [number] Trademarks are listed in the Trademark Clearinghouse:

1. Mark: Jurisdiction: Goods: [click here for more if maximum character count is exceeded]
   International Class of Goods and Services or Equivalent if applicable: Trademark
   Registrant: Trademark Registrant Contact:

   [with links to the TM registrations as listed in the TM Clearinghouse]

2. Mark: Jurisdiction: Goods: [click here for more if maximum character count is exceeded]
   International Class of Goods and Services or Equivalent if applicable: Trademark
   Registrant:

   Trademark Registrant Contact:
   ****** [with links to the TM registrations as listed in the TM Clearinghouse]

X. 1. Mark: Jurisdiction: Goods: [click here for more if maximum character count is exceeded] International Class of Goods and Services or Equivalent if applicable: Trademark
   Registrant: Trademark Registrant Contact:
UNIFORM RAPID SUSPENSION SYSTEM ("URS")
11 JANUARY 2012

DRAFT PROCEDURE

1. Complaint

1.1 Filing the Complaint

a) Proceedings are initiated by electronically filing with a URS Provider a Complaint outlining the trademark rights and the actions complained of entitling the trademark holder to relief.

b) Each Complaint must be accompanied by the appropriate fee, which is under consideration. The fees will be non-refundable.

c) One Complaint is acceptable for multiple related companies against one Registrant, but only if the companies complaining are related. Multiple Registrants can be named in one Complaint only if it can be shown that they are in some way related. There will not be a minimum number of domain names imposed as a prerequisite to filing.

1.2 Contents of the Complaint

The form of the Complaint will be simple and as formulaic as possible. There will be a Form Complaint. The Form Complaint shall include space for the following:

1.2.1 Name, email address and other contact information for the Complaining Party (Parties).

1.2.2 Name, email address and contact information for any person authorized to act on behalf of Complaining Parties.

1.2.3 Name of Registrant (i.e. relevant information available from Whois) and Whois listed available contact information for the relevant domain name(s).

1.2.4 The specific domain name(s) that are the subject of the Complaint. For each domain name, the Complainant shall include a copy of the currently available Whois information and a description and copy, if available, of the offending portion of the website content associated with each domain name that is the subject of the Complaint.

1.2.5 The specific trademark/service marks upon which the Complaint is based and pursuant to which the Complaining Parties are asserting their rights to them, for which goods and in connection with what services.

1.2.6 A statement of the grounds upon which the Complaint is based setting forth facts showing that the Complaining Party is entitled to relief, namely:
1.2.6.1. that the registered domain name is identical or confusingly similar to a word mark: (i) for which the Complainant holds a valid national or regional registration and that is in current use; or (ii) that has been validated through court proceedings; or (iii) that is specifically protected by a statute or treaty in effect at the time the URS complaint is filed.

a. Use can be shown by demonstrating that evidence of use – which can be a declaration and one specimen of current use in commerce - was submitted to, and validated by, the Trademark Clearinghouse

b. Proof of use may also be submitted directly with the URS Complaint.

and

1.2.6.2. that the Registrant has no legitimate right or interest to the domain name; and

1.2.6.3. that the domain was registered and is being used in bad faith.

A non-exclusive list of circumstances that demonstrate bad faith registration and use by the Registrant include:

a. Registrant has registered or acquired the domain name primarily for the purpose of selling, renting or otherwise transferring the domain name registration to the complainant who is the owner of the trademark or service mark or to a competitor of that complainant, for valuable consideration in excess of documented out-of-pocket costs directly related to the domain name; or

b. Registrant has registered the domain name in order to prevent the trademark holder or service mark from reflecting the mark in a corresponding domain name, provided that Registrant has engaged in a pattern of such conduct; or

c. Registrant registered the domain name primarily for the purpose of disrupting the business of a competitor; or

d. By using the domain name Registrant has intentionally attempted to attract for commercial gain, Internet users to Registrant’s web site or other on-line location, by creating a likelihood of confusion with the complainant’s mark as to the source, sponsorship, affiliation, or endorsement of Registrant’s web site or location or of a product or service on that web site or location.
1.2.7 A box in which the Complainant may submit up to 500 words of explanatory free form text.

1.2.8 An attestation that the Complaint is not being filed for any improper basis and that there is a sufficient good faith basis for filing the Complaint.

2. Fees

2.1 The URS Provider will charge fees to the Complainant. Fees are thought to be in the range of USD 300 per proceeding, but will ultimately be set by the Provider.

2.2 Complaints listing fifteen (15) or more disputed domain names registered by the same registrant will be subject to a Response Fee which will be refundable to the prevailing party. Under no circumstances shall the Response Fee exceed the fee charged to the Complainant.

3. Administrative Review

3.1 Complaints will be subjected to an initial administrative review by the URS Provider for compliance with the filing requirements. This is a review to determine that the Complaint contains all of the necessary information, and is not a determination as to whether a prima facie case has been established.

3.2 The Administrative Review shall be conducted within two (2) business days of submission of the Complaint to the URS Provider.

3.3 Given the rapid nature of this Procedure, and the intended low level of required fees, there will be no opportunity to correct inadequacies in the filing requirements.

3.4 If a Complaint is deemed non-compliant with filing requirements, the Complaint will be dismissed without prejudice to the Complainant filing a new complaint. The initial filing fee shall not be refunded in these circumstances.

4. Notice and Locking of Domain

4.1 Upon completion of the Administrative Review, the URS Provider must immediately notify the registry operator (via email) (“Notice of Complaint”) after the Complaint has been deemed compliant with the filing requirements. Within 24 hours of receipt of the Notice of Complaint from the URS Provider, the registry operator shall “lock” the domain, meaning the registry shall restrict all changes to the registration data, including transfer and deletion of the domain names, but the name will continue to resolve. The registry operator will notify the URS Provider immediately upon locking the domain name (“Notice of Lock”).

4.2 Within 24 hours after receiving Notice of Lock from the registry operator, the URS Provider shall notify the Registrant of the Complaint, sending a hard copy of the Notice of Complaint to the addresses listed in the Whois contact information, and providing an electronic copy of the Complaint, advising of the locked status, as well as the potential
effects if the Registrant fails to respond and defend against the Complaint. Notices must be clear and understandable to Registrants located globally. The Notice of Complaint shall be in English and translated by the Provider into the predominant language used in the registrant’s country or territory.

4.3 All Notices to the Registrant shall be sent through email, fax (where available) and postal mail. The Complaint and accompanying exhibits, if any, shall be served electronically.

4.4 The URS Provider shall also electronically notify the registrar of record for the domain name at issue via the addresses the registrar has on file with ICANN.

5. The Response

5.1 A Registrant will have 14 calendar days from the date the URS Provider sent its Notice of Complaint to the Registrant to electronically file a Response with the URS Provider. Upon receipt, the Provider will electronically send a copy of the Response, and accompanying exhibits, if any, to the Complainant.

5.2 No filing fee will be charged if the Registrant files its Response prior to being declared in default or not more than thirty (30) days following a Determination. For Responses filed more than thirty (30) days after a Determination, the Registrant should pay a reasonable non-refundable fee for re-examination, plus a Response Fee as set forth in section 2.2 above if the Complaint lists twenty-six (26) or more disputed domain names against the same registrant. The Response Fee will be refundable to the prevailing party.

5.3 Upon request by the Registrant, a limited extension of time to respond may be granted by the URS Provider if there is a good faith basis for doing so. In no event shall the extension be for more than seven (7) calendar days.

5.4 The Response shall be no longer than 2,500 words, excluding attachments, and the content of the Response should include the following:

5.4.1 Confirmation of Registrant data.

5.4.2 Specific admission or denial of each of the grounds upon which the Complaint is based.

5.4.3 Any defense which contradicts the Complainant’s claims.

5.4.4 A statement that the contents are true and accurate.

5.5 In keeping with the intended expedited nature of the URS and the remedy afforded to a successful Complainant, affirmative claims for relief by the Registrant will not be permitted except for an allegation that the Complainant has filed an abusive Complaint.

5.6 Once the Response is filed, and the URS Provider determines that the Response is compliant with the filing requirements of a Response (which shall be on the same day),
the Complaint, Response and supporting materials will immediately be sent to a qualified Examiner, selected by the URS Provider, for review and Determination. All materials submitted are considered by the Examiner.

5.7 The Response can contain any facts refuting the claim of bad faith registration by setting out any of the following circumstances:

5.7.1 Before any notice to Registrant of the dispute, Registrant’s use of, or demonstrable preparations to use, the domain name or a name corresponding to the domain name in connection with a bona fide offering of goods or services; or

5.7.2 Registrant (as an individual, business or other organization) has been commonly known by the domain name, even if Registrant has acquired no trademark or service mark rights; or

5.7.3 Registrant is making a legitimate or fair use of the domain name, without intent for commercial gain to misleadingly divert consumers or to tarnish the trademark or service mark at issue.

Such claims, if found by the Examiner to be proved based on its evaluation of all evidence, shall result in a finding in favor of the Registrant.

5.8 The Registrant may also assert Defenses to the Complaint to demonstrate that the Registrant’s use of the domain name is not in bad faith by showing, for example, one of the following:

5.8.1 The domain name is generic or descriptive and the Registrant is making fair use of it.

5.8.2 The domain name sites are operated solely in tribute to or in criticism of a person or business that is found by the Examiner to be fair use.

5.8.3 Registrant’s holding of the domain name is consistent with an express term of a written agreement entered into by the disputing Parties and that is still in effect.

5.8.4 The domain name is not part of a wider pattern or series of abusive registrations because the Domain Name is of a significantly different type or character to other domain names registered by the Registrant.

5.9 Other factors for the Examiner to consider:

5.9.1 Trading in domain names for profit, and holding a large portfolio of domain names, are of themselves not indicia of bad faith under the URS. Such conduct, however, may be abusive in a given case depending on the circumstances of the dispute. The Examiner must review each case on its merits.

5.9.2 Sale of traffic (i.e. connecting domain names to parking pages and earning click-per-view revenue) does not in and of itself constitute bad faith under the URS.
Such conduct, however, may be abusive in a given case depending on the circumstances of the dispute. The Examiner will take into account:

5.9.2.1. the nature of the domain name;

5.9.2.2. the nature of the advertising links on any parking page associated with the domain name; and

5.9.2.3. that the use of the domain name is ultimately the Registrant’s responsibility.

6. Default

6.1 If at the expiration of the 14-day answer period (or extended period if granted), the Registrant does not submit an answer, the Complaint proceeds to Default.

6.2 In either case, the Provider shall provide Notice of Default via email to the Complainant and Registrant, and via mail and fax to Registrant. During the Default period, the Registrant will be prohibited from changing content found on the site to argue that it is now a legitimate use and will also be prohibited from changing the Whois information.

6.3 All Default cases proceed to Examination for review on the merits of the claim.

6.4 If after Examination in Default cases, the Examiner rules in favor of Complainant, Registrant shall have the right to seek relief from Default via de novo review by filing a Response at any time up to six months after the date of the Notice of Default. The Registrant will also be entitled to request an extension of an additional six months if the extension is requested before the expiration of the initial six-month period.

6.5 If a Response is filed after: (i) the Respondent was in Default (so long as the Response is filed in accordance with 6.4 above); and (ii) proper notice is provided in accordance with the notice requirements set forth above, the domain name shall again resolve to the original IP address as soon as practical, but shall remain locked as if the Response had been filed in a timely manner before Default. The filing of a Response after Default is not an appeal; the case is considered as if responded to in a timely manner.

6.5 If after Examination in Default case, the Examiner rules in favor of Registrant, the Provider shall notify the Registry Operator to unlock the name and return full control of the domain name registration to the Registrant.

7. Examiners

7.1 One Examiner selected by the Provider will preside over a URS proceeding.

7.2 Examiners should have demonstrable relevant legal background, such as in trademark law, and shall be trained and certified in URS proceedings. Specifically, Examiners shall be provided with instructions on the URS elements and defenses and how to conduct the examination of a URS proceeding.
7.3 Examiners used by any given URS Provider shall be rotated to the extent feasible to avoid “forum or examiner shopping.” URS Providers are strongly encouraged to work equally with all certified Examiners, with reasonable exceptions (such as language needs, non-performance, or malfeasance) to be determined on a case by case analysis.

8. Examination Standards and Burden of Proof

8.1 The standards that the qualified Examiner shall apply when rendering its Determination are whether:

8.1.2 The registered domain name is identical or confusingly similar to a word mark: (i) for which the Complainant holds a valid national or regional registration and that is in current use; or (ii) that has been validated through court proceedings; or (iii) that is specifically protected by a statute or treaty currently in effect and that was in effect at the time the URS Complaint is filed; and

8.1.2.1 Use can be shown by demonstrating that evidence of use – which can be a declaration and one specimen of current use – was submitted to, and validated by, the Trademark Clearinghouse.

8.1.2.2 Proof of use may also be submitted directly with the URS Complaint.

8.1.2 The Registrant has no legitimate right or interest to the domain name; and

8.1.3 The domain was registered and is being used in a bad faith.

8.2 The burden of proof shall be clear and convincing evidence.

8.3 For a URS matter to conclude in favor of the Complainant, the Examiner shall render a Determination that there is no genuine issue of material fact. Such Determination may include that: (i) the Complainant has rights to the name; and (ii) the Registrant has no rights or legitimate interest in the name. This means that the Complainant must present adequate evidence to substantiate its trademark rights in the domain name (e.g., evidence of a trademark registration and evidence that the domain name was registered and is being used in bad faith in violation of the URS).

8.4 If the Examiner finds that the Complainant has not met its burden, or that genuine issues of material fact remain in regards to any of the elements, the Examiner will reject the Complaint under the relief available under the URS. That is, the Complaint shall be dismissed if the Examiner finds that evidence was presented or is available to the Examiner to indicate that the use of the domain name in question is a non-infringing use or fair use of the trademark.

8.5 Where there is any genuine contestable issue as to whether a domain name registration and use of a trademark are in bad faith, the Complaint will be denied, the URS proceeding will be terminated without prejudice, e.g., a UDRP, court proceeding or
another URS may be filed. The URS is not intended for use in any proceedings with open questions of fact, but only clear cases of trademark abuse.

8.6 To restate in another way, if the Examiner finds that all three standards are satisfied by clear and convincing evidence and that there is no genuine contestable issue, then the Examiner shall issue a Determination in favor of the Complainant. If the Examiner finds that any of the standards have not been satisfied, then the Examiner shall deny the relief requested, thereby terminating the URS proceeding without prejudice to the Complainant to proceed with an action in court of competent jurisdiction or under the UDRP.

9. Determination

9.1 There will be no discovery or hearing; the evidence will be the materials submitted with the Complaint and the Response, and those materials will serve as the entire record used by the Examiner to make a Determination.

9.2 If the Complainant satisfies the burden of proof, the Examiner will issue a Determination in favor of the Complainant. The Determination will be published on the URS Provider’s website. However, there should be no other preclusive effect of the Determination other than the URS proceeding to which it is rendered.

9.3 If the Complainant does not satisfy the burden of proof, the URS proceeding is terminated and full control of the domain name registration shall be returned to the Registrant.

9.4 Determinations resulting from URS proceedings will be published by the service provider in a format specified by ICANN.

9.5 Determinations shall also be emailed by the URS Provider to the Registrant, the Complainant, the Registrar, and the Registry Operator, and shall specify the remedy and required actions of the registry operator to comply with the Determination.

9.6 To conduct URS proceedings on an expedited basis, examination should begin immediately upon the earlier of the expiration of a fourteen (14) day Response period (or extended period if granted), or upon the submission of the Response. A Determination shall be rendered on an expedited basis, with the stated goal that it be rendered within three (3) business days from when Examination began. Absent extraordinary circumstances, however, Determinations must be issued no later than five (5) days after the Response is filed. Implementation details will be developed to accommodate the needs of service providers once they are selected. (The tender offer for potential service providers will indicate that timeliness will be a factor in the award decision.)

10. Remedy

10.1 If the Determination is in favor of the Complainant, the decision shall be immediately transmitted to the registry operator.
10.2 Immediately upon receipt of the Determination, the registry operator shall suspend the domain name, which shall remain suspended for the balance of the registration period and would not resolve to the original web site. The nameservers shall be redirected to an informational web page provided by the URS Provider about the URS. The URS Provider shall not be allowed to offer any other services on such page, nor shall it directly or indirectly use the web page for advertising purposes (either for itself or any other third party). The Whois for the domain name shall continue to display all of the information of the original Registrant except for the redirection of the nameservers. In addition, the Whois shall reflect that the domain name will not be able to be transferred, deleted or modified for the life of the registration.

10.3 There shall be an option for a successful Complainant to extend the registration period for one additional year at commercial rates.

10.4 No other remedies should be available in the event of a Determination in favor of the Complainant.

11. Abusive Complaints

11.1 The URS shall incorporate penalties for abuse of the process by trademark holders.

11.2 In the event a party is deemed to have filed two (2) abusive Complaints, or one (1) “deliberate material falsehood,” that party shall be barred from utilizing the URS for one-year following the date of issuance of a Determination finding a complainant to have: (i) filed its second abusive complaint; or (ii) filed a deliberate material falsehood.

11.3 A Complaint may be deemed abusive if the Examiner determines:

11.3.1 it was presented solely for improper purpose such as to harass, cause unnecessary delay, or needlessly increase the cost of doing business; and

11.3.2 (i) the claims or other assertions were not warranted by any existing law or the URS standards; or (ii) the factual contentions lacked any evidentiary support

11.4 An Examiner may find that Complaint contained a deliberate material falsehood if it contained an assertion of fact, which at the time it was made, was made with the knowledge that it was false and which, if true, would have an impact on the outcome on the URS proceeding.

11.5 Two findings of “deliberate material falsehood” shall permanently bar the party from utilizing the URS.

11.6 URS Providers shall be required to develop a process for identifying and tracking barred parties, and parties whom Examiners have determined submitted abusive complaints or deliberate material falsehoods.
11.7 The dismissal of a complaint for administrative reasons or a ruling on the merits, in itself, shall not be evidence of filing an abusive complaint.

11.8 A finding that filing of a complaint was abusive or contained a deliberate materially falsehood can be appealed solely on the grounds that an Examiner abused his/her discretion, or acted in an arbitrary or capricious manner.

12. **Appeal**

12.1 Either party shall have a right to seek a de novo appeal of the Determination based on the existing record within the URS proceeding for a reasonable fee to cover the costs of the appeal. An appellant must identify the specific grounds on which the party is appealing, including why the appellant claims the Examiner’s Determination was incorrect.

12.2 The fees for an appeal shall be borne by the appellant. A limited right to introduce new admissible evidence that is material to the Determination will be allowed upon payment of an additional fee, provided the evidence clearly pre-dates the filing of the Complaint. The Appeal Panel, to be selected by the Provider, may request, in its sole discretion, further statements or documents from either of the Parties.

12.3 Filing an appeal shall not change the domain name’s resolution. For example, if the domain name no longer resolves to the original nameservers because of a Determination in favor or the Complainant, the domain name shall continue to point to the informational page provided by the URS Provider. If the domain name resolves to the original nameservers because of a Determination in favor of the registrant, it shall continue to resolve during the appeal process.

12.4 An appeal must be filed within 14 days after a Determination is issued and any Response must be filed 14 days after an appeal is filed.

12.5 If a respondent has sought relief from Default by filing a Response within six months (or the extended period if applicable) of issuance of initial Determination, an appeal must be filed within 14 days from date the second Determination is issued and any Response must be filed 14 days after the appeal is filed.

12.6 Notice of appeal and findings by the appeal panel shall be sent by the URS Provider via e-mail to the Registrant, the Complainant, the Registrar, and the Registry Operator.

12.7 The Providers’ rules and procedures for appeals, other than those stated above, shall apply.

13. **Other Available Remedies**

The URS Determination shall not preclude any other remedies available to the appellant, such as UDRP (if appellant is the Complainant), or other remedies as may be available in a court of competition jurisdiction. A URS Determination for or against a party shall not prejudice the
party in UDRP or any other proceedings.

14. **Review of URS**

A review of the URS procedure will be initiated one year after the first Examiner Determination is issued. Upon completion of the review, a report shall be published regarding the usage of the procedure, including statistical information, and posted for public comment on the usefulness and effectiveness of the procedure.
TRADEMARK POST-DELEGATION DISPUTE RESOLUTION PROCEDURE (TRADEMARK PDDRP)
11 JANUARY 2012

1. Parties to the Dispute

The parties to the dispute will be the trademark holder and the gTLD registry operator. ICANN shall not be a party.

2. Applicable Rules

2.1 This procedure is intended to cover Trademark post-delegation dispute resolution proceedings generally. To the extent more than one Trademark PDDRP provider (“Provider”) is selected to implement the Trademark PDDRP, each Provider may have additional rules that must be followed when filing a Complaint. The following are general procedures to be followed by all Providers.

2.2 In the Registry Agreement, the registry operator agrees to participate in all post-delegation procedures and be bound by the resulting Determinations.

3. Language

3.1 The language of all submissions and proceedings under the procedure will be English.

3.2 Parties may submit supporting evidence in their original language, provided and subject to the authority of the Expert Panel to determine otherwise, that such evidence is accompanied by an English translation of all relevant text.

4. Communications and Time Limits

4.1 All communications with the Provider must be submitted electronically.

4.2 For the purpose of determining the date of commencement of a time limit, a notice or other communication will be deemed to have been received on the day that it is transmitted to the appropriate contact person designated by the parties.

4.3 For the purpose of determining compliance with a time limit, a notice or other communication will be deemed to have been sent, made or transmitted on the day that it is dispatched.

4.4 For the purpose of calculating a period of time under this procedure, such period will begin to run on the day following the date of receipt of a notice or other communication.

4.5 All references to day limits shall be considered as calendar days unless otherwise specified.
5. **Standing**

5.1 The mandatory administrative proceeding will commence when a third-party complainant ("Complainant") has filed a Complaint with a Provider asserting that the Complainant is a trademark holder (which may include either registered or unregistered marks as defined below) claiming that one or more of its marks have been infringed, and thereby the Complainant has been harmed, by the registry operator’s manner of operation or use of the gTLD.

5.2 Before proceeding to the merits of a dispute, and before the Respondent is required to submit a substantive Response, or pay any fees, the Provider shall appoint a special one-person Panel to perform an initial “threshold” review ("Threshold Review Panel").

6. **Standards**

For purposes of these standards, “registry operator” shall include entities directly or indirectly controlling, controlled by or under common control with a registry operator, whether by ownership or control of voting securities, by contract or otherwise where ‘control’ means the possession, directly or indirectly, of the power to direct or cause the direction of the management and policies of an entity, whether by ownership or control of voting securities, by contract or otherwise.

6.1 **Top Level:**

A complainant must assert and prove, by clear and convincing evidence, that the registry operator’s affirmative conduct in its operation or use of its gTLD string that is identical or confusingly similar to the complainant’s mark, causes or materially contributes to the gTLD doing one of the following:

(a) taking unfair advantage of the distinctive character or the reputation of the complainant’s mark; or

(b) impairing the distinctive character or the reputation of the complainant’s mark; or

(c) creating a likelihood of confusion with the complainant’s mark.

An example of infringement at the top-level is where a TLD string is identical to a trademark and then the registry operator holds itself out as the beneficiary of the mark.

6.2 **Second Level**

Complainants are required to prove, by clear and convincing evidence that, through the registry operator’s affirmative conduct:

(a) there is a substantial pattern or practice of specific bad faith intent by the registry operator to profit from the sale of trademark infringing domain names; and
(b) the registry operator’s bad faith intent to profit from the systematic registration of domain names within the gTLD that are identical or confusingly similar to the complainant’s mark, which:

(i) takes unfair advantage of the distinctive character or the reputation of the complainant’s mark; or

(ii) impairs the distinctive character or the reputation of the complainant’s mark, or

(iii) creates a likelihood of confusion with the complainant’s mark.

In other words, it is not sufficient to show that the registry operator is on notice of possible trademark infringement through registrations in the gTLD. The registry operator is not liable under the PDDRP solely because: (i) infringing names are in its registry; or (ii) the registry operator knows that infringing names are in its registry; or (iii) the registry operator did not monitor the registrations within its registry.

A registry operator is not liable under the PDDRP for any domain name registration that: (i) is registered by a person or entity that is unaffiliated with the registry operator; (ii) is registered without the direct or indirect encouragement, inducement, initiation or direction of any person or entity affiliated with the registry operator; and (iii) provides no direct or indirect benefit to the registry operator other than the typical registration fee (which may include other fees collected incidental to the registration process for value added services such enhanced registration security).

An example of infringement at the second level is where a registry operator has a pattern or practice of actively and systematically encouraging registrants to register second level domain names and to take unfair advantage of the trademark to the extent and degree that bad faith is apparent. Another example of infringement at the second level is where a registry operator has a pattern or practice of acting as the registrant or beneficial user of infringing registrations, to monetize and profit in bad faith.

7. Complaint

7.1 Filing:

The Complaint will be filed electronically. Once the Administrative Review has been completed and the Provider deems the Complaint be in compliance, the Provider will electronically serve the Complaint and serve a paper notice on the registry operator that is the subject of the Complaint (“Notice of Complaint”) consistent with the contact information listed in the Registry Agreement.

7.2 Content:

7.2.1 The name and contact information, including address, phone, and email address, of the Complainant, and, to the best of Complainant’s knowledge, the name and address of the current owner of the registration.
7.2.2 The name and contact information, including address, phone, and email address of any person authorized to act on behalf of Complainant.

7.2.3 A statement of the nature of the dispute, and any relevant evidence, which shall include:

(a) The particular legal rights claim being asserted, the marks that form the basis for the dispute and a short and plain statement of the basis upon which the Complaint is being filed.

(b) A detailed explanation of how the Complainant’s claim meets the requirements for filing a claim pursuant to that particular ground or standard.

(c) A detailed explanation of the validity of the Complaint and why the Complainant is entitled to relief.

(d) A statement that the Complainant has at least 30 days prior to filing the Complaint notified the registry operator in writing of: (i) its specific concerns and specific conduct it believes is resulting in infringement of Complainant’s trademarks and (ii) its willingness to meet to resolve the issue.

(e) An explanation of how the mark is used by the Complainant (including the type of goods/services, period and territory of use – including all online usage) or otherwise protected by statute, treaty or has been validated by a court or the Clearinghouse.

(f) Copies of any documents that the Complainant considers to evidence its basis for relief, including evidence of current use of the Trademark at issue in the Complaint and domain name registrations.

(g) A statement that the proceedings are not being brought for any improper purpose.

(h) A statement describing how the registration at issue has harmed the trademark owner.

7.3 Complaints will be limited 5,000 words and 20 pages, excluding attachments, unless the Provider determines that additional material is necessary.

7.4 At the same time the Complaint is filed, the Complainant will pay a non-refundable filing fee in the amount set in accordance with the applicable Provider rules. In the event that the filing fee is not paid within 10 days of the receipt of the Complaint by the Provider, the Complaint will be dismissed without prejudice.
8. **Administrative Review of the Complaint**

8.1 All Complaints will be reviewed by the Provider within five (5) business days of submission to the Provider to determine whether the Complaint contains all necessary information and complies with the procedural rules.

8.2 If the Provider finds that the Complaint complies with procedural rules, the Complaint will be deemed filed, and the proceedings will continue to the Threshold Review. If the Provider finds that the Complaint does not comply with procedural rules, it will electronically notify the Complainant of such non-compliant and provide the Complainant five (5) business days to submit an amended Complaint. If the Provider does not receive an amended Complaint within the five (5) business days provided, it will dismiss the Complaint and close the proceedings without prejudice to the Complainant’s submission of a new Complaint that complies with procedural rules. Filing fees will not be refunded.

8.3 If deemed compliant, the Provider will electronically serve the Complaint on the registry operator and serve the Notice of Complaint consistent with the contact information listed in the Registry Agreement.

9. **Threshold Review**

9.1 Provider shall establish a Threshold Review Panel, consisting of one panelist selected by the Provider, for each proceeding within five (5) business days after completion of Administrative Review and the Complaint has been deemed compliant with procedural rules.

9.2 The Threshold Review Panel shall be tasked with determining whether the Complainant satisfies the following criteria:

9.2.1 The Complainant is a holder of a word mark that: (i) is nationally or regionally registered and that is in current use; or (ii) has been validated through court proceedings; or (iii) that is specifically protected by a statute or treaty at the time the PDDRP complaint is filed;

9.2.1.1 Use can be shown by demonstrating that evidence of use – which can be a declaration and one specimen of current use – was submitted to, and validated by, the Trademark Clearinghouse

9.2.1.2 Proof of use may also be submitted directly with the Complaint.

9.2.2 The Complainant has asserted that it has been materially harmed as a result of trademark infringement;

9.2.3 The Complainant has asserted facts with sufficient specificity that, if everything the Complainant asserted is true, states a claim under the Top Level Standards herein OR
The Complainant has asserted facts with sufficient specificity that, if everything the Complainant asserted is true, states a claim under the Second Level Standards herein;

9.2.4 The Complainant has asserted that: (i) at least 30 days prior to filing the Complaint the Complainant notified the registry operator in writing of its specific concerns and specific conduct it believes is resulting in infringement of Complainant’s trademarks, and it willingness to meet to resolve the issue; (ii) whether the registry operator responded to the Complainant’s notice of specific concerns; and (iii) if the registry operator did respond, that the Complainant attempted to engage in good faith discussions to resolve the issue prior to initiating the PDDRP.

9.3 Within ten (10) business days of date Provider served Notice of Complaint, the registry operator shall have the opportunity, but is not required, to submit papers to support its position as to the Complainant’s standing at the Threshold Review stage. If the registry operator chooses to file such papers, it must pay a filing fee.

9.4 If the registry operator submits papers, the Complainant shall have ten (10) business days to submit an opposition.

9.5 The Threshold Review Panel shall have ten (10) business days from due date of Complainant’s opposition or the due date of the registry operator’s papers if none were filed, to issue Threshold Determination.

9.6 Provider shall electronically serve the Threshold Determination on all parties.

9.7 If the Complainant has not satisfied the Threshold Review criteria, the Provider will dismiss the proceedings on the grounds that the Complainant lacks standing and declare that the registry operator is the prevailing party.

9.8 If the Threshold Review Panel determines that the Complainant has standing and satisfied the criteria then the Provider to will commence the proceedings on the merits.

10. Response to the Complaint

10.1 The registry operator must file a Response to each Complaint within forty-five (45) days after the date of the Threshold Review Panel Declaration.

10.2 The Response will comply with the rules for filing of a Complaint and will contain the name and contact information for the registry operator, as well as a point-by-point response to the statements made in the Complaint.

10.3 The Response must be filed with the Provider and the Provider must serve it upon the Complainant in electronic form with a hard-copy notice that it has been served.
10.4 Service of the Response will be deemed effective, and the time will start to run for a Reply, upon confirmation that the electronic Response and hard-copy notice of the Response was sent by the Provider to the addresses provided by the Complainant.

10.5 If the registry operator believes the Complaint is without merit, it will affirmatively plead in its Response the specific grounds for the claim.

11. Reply

11.1 The Complainant is permitted ten (10) days from Service of the Response to submit a Reply addressing the statements made in the Response showing why the Complaint is not “without merit.” A Reply may not introduce new facts or evidence into the record, but shall only be used to address statements made in the Response. Any new facts or evidence introduced in a Response shall be disregarded by the Expert Panel.

11.2 Once the Complaint, Response and Reply (as necessary) are filed and served, a Panel will be appointed and provided with all submissions.

12. Default

12.1 If the registry operator fails to respond to the Complaint, it will be deemed to be in default.

12.2 Limited rights to set aside the finding of default will be established by the Provider, but in no event will they be permitted absent a showing of good cause to set aside the finding of default.

12.3 The Provider shall provide notice of Default via email to the Complainant and registry operator.

12.4 All Default cases shall proceed to Expert Determination on the merits.

13. Expert Panel

13.1 The Provider shall establish an Expert Panel within 21 days after receiving the Reply, or if no Reply is filed, within 21 days after the Reply was due to be filed.

13.2 The Provider shall appoint a one-person Expert Panel, unless any party requests a three-member Expert Panel. No Threshold Panel member shall serve as an Expert Panel member in the same Trademark PDDRP proceeding.

13.3 In the case where either party requests a three-member Expert Panel, each party (or each side of the dispute if a matter has been consolidated) shall select an Expert and the two selected Experts shall select the third Expert Panel member. Such selection shall be made pursuant to the Providers rules or procedures. Trademark PDDRP panelists within a Provider shall be rotated to the extent feasible.
13.4 Expert Panel member must be independent of the parties to the post-delegation challenge. Each Provider will follow its adopted procedures for requiring such independence, including procedures for challenging and replacing a panelist for lack of independence.

14. **Costs**

14.1 The Provider will estimate the costs for the proceedings that it administers under this procedure in accordance with the applicable Provider rules. Such costs will be estimated to cover the administrative fees of the Provider, the Threshold Review Panel and the Expert Panel, and are intended to be reasonable.

14.2 The Complainant shall be required to pay the filing fee as set forth above in the “Complaint” section, and shall be required to submit the full amount of the Provider estimated administrative fees, the Threshold Review Panel fees and the Expert Panel fees at the outset of the proceedings. Fifty percent of that full amount shall be in cash (or cash equivalent) to cover the Complainant’s share of the proceedings and the other 50% shall be in either cash (or cash equivalent), or in bond, to cover the registry operator’s share if the registry operator prevails.

14.3 If the Panel declares the Complainant to be the prevailing party, the registry operator is required to reimburse Complainant for all Panel and Provider fees incurred. Failure to do shall be deemed a violation of the Trademark PDDR and a breach of the Registry Agreement, subject to remedies available under the Agreement up to and including termination.

15. **Discovery**

15.1 Whether and to what extent discovery is allowed is at the discretion of the Panel, whether made on the Panel’s own accord, or upon request from the Parties.

15.2 If permitted, discovery will be limited to that for which each Party has a substantial need.

15.3 In extraordinary circumstances, the Provider may appoint experts to be paid for by the Parties, request live or written witness testimony, or request limited exchange of documents.

15.4 At the close of discovery, if permitted by the Expert Panel, the Parties will make a final evidentiary submission, the timing and sequence to be determined by the Provider in consultation with the Expert Panel.

16. **Hearings**

16.1 Disputes under this Procedure will be resolved without a hearing unless either party requests a hearing or the Expert Panel determines on its own initiative that one is necessary.
16.2 If a hearing is held, videoconferences or teleconferences should be used if at all possible. If not possible, then the Expert Panel will select a place for hearing if the Parties cannot agree.

16.3 Hearings should last no more than one day, except in the most extraordinary circumstances.

16.4 All dispute resolution proceedings will be conducted in English.

17. **Burden of Proof**

The Complainant bears the burden of proving the allegations in the Complaint; the burden must be by clear and convincing evidence.

18. **Remedies**

18.1 Since registrants are not a party to the action, a recommended remedy cannot take the form of deleting, transferring or suspending registrations (except to the extent registrants have been shown to be officers, directors, agents, employees, or entities under common control with a registry operator).

18.2 Recommended remedies will not include monetary damages or sanctions to be paid to any party other than fees awarded pursuant to section 14.

18.3 The Expert Panel may recommend a variety of graduated enforcement tools against the registry operator if it the Expert Panel determines that the registry operator is liable under this Trademark PDDRP, including:

18.3.1 Remedial measures for the registry to employ to ensure against allowing future infringing registrations, which may be in addition to what is required under the registry agreement, except that the remedial measures shall not:

(a) Require the Registry Operator to monitor registrations not related to the names at issue in the PDDRP proceeding; or

(b) Direct actions by the registry operator that are contrary to those required under the Registry Agreement;

18.3.2 Suspension of accepting new domain name registrations in the gTLD until such time as the violation(s) identified in the Determination is(are) cured or a set period of time;

OR,

18.3.3 In extraordinary circumstances where the registry operator acted with malice, providing for the termination of a Registry Agreement.
18.4 In making its recommendation of the appropriate remedy, the Expert Panel will consider the ongoing harm to the Complainant, as well as the harm the remedies will create for other, unrelated, good faith domain name registrants operating within the gTLD.

18.5 The Expert Panel may also determine whether the Complaint was filed “without merit,” and, if so, award the appropriate sanctions on a graduated scale, including:

18.5.1 Temporary bans from filing Complaints;

18.5.2 Imposition of costs of registry operator, including reasonable attorney fees; and

18.5.3 Permanent bans from filing Complaints after being banned temporarily.

18.6 Imposition of remedies shall be at the discretion of ICANN, but absent extraordinary circumstances, those remedies will be in line with the remedies recommended by the Expert Panel.

19. The Expert Panel Determination

19.1 The Provider and the Expert Panel will make reasonable efforts to ensure that the Expert Determination is issued within 45 days of the appointment of the Expert Panel and absent good cause, in no event later than 60 days after the appointment of the Expert Panel.

19.2 The Expert Panel will render a written Determination. The Expert Determination will state whether or not the Complaint is factually founded and provide the reasons for that Determination. The Expert Determination should be publicly available and searchable on the Provider’s web site.

19.3 The Expert Determination may further include a recommendation of specific remedies. Costs and fees to the Provider, to the extent not already paid, will be paid within thirty (30) days of the Expert Panel’s Determination.

19.4 The Expert Determination shall state which party is the prevailing party.

19.5 While the Expert Determination that a registry operator is liable under the standards of the Trademark PDDRP shall be taken into consideration, ICANN will have the authority to impose the remedies, if any, that ICANN deems appropriate given the circumstances of each matter.

20. Appeal of Expert Determination

20.1 Either party shall have a right to seek a de novo appeal of the Expert Determination of liability or recommended remedy based on the existing record within the Trademark PDDRP proceeding for a reasonable fee to cover the costs of the appeal.

20.2 An appeal must be filed with the Provider and served on all parties within 20 days after an Expert Determination is issued and a response to the appeal must be filed within 20
days after the appeal. Manner and calculation of service deadlines shall in consistent
with those set forth in Section 4 above, “Communication and Time Limits.”

20.3 A three-member Appeal Panel is to be selected by the Provider, but no member of the
Appeal Panel shall also have been an Expert Panel member.

20.4 The fees for an appeal in the first instance shall be borne by the appellant.

20.5 A limited right to introduce new admissible evidence that is material to the
Determination will be allowed upon payment of an additional fee, provided the
evidence clearly pre-dates the filing of the Complaint.

20.6 The Appeal Panel may request at its sole discretion, further statements or evidence
from any party regardless of whether the evidence pre-dates the filing of the Complaint
if the Appeal Panel determines such evidence is relevant.

20.7 The prevailing party shall be entitled to an award of costs of appeal.

20.8 The Providers rules and procedures for appeals, other than those stated above, shall
apply.

21. Challenge of a Remedy

21.1 ICANN shall not implement a remedy for violation of the Trademark PDDRP for at least
20 days after the issuance of an Expert Determination, providing time for an appeal to
be filed.

21.2 If an appeal is filed, ICANN shall stay its implementation of a remedy pending resolution
of the appeal.

21.3 If ICANN decides to implement a remedy for violation of the Trademark PDDRP, ICANN
will wait ten (10) business days (as observed in the location of its principal office) after
notifying the registry operator of its decision. ICANN will then implement the decision
unless it has received from the registry operator during that ten (10) business-day
period official documentation that the registry operator has either: (a) commenced a
lawsuit against the Complainant in a court of competent jurisdiction challenging the
Expert Determination of liability against the registry operator, or (b) challenged the
intended remedy by initiating dispute resolution under the provisions of its Registry
Agreement. If ICANN receives such documentation within the ten (10) business day
period, it will not seek to implement the remedy in furtherance of the Trademark
PDDRP until it receives: (i) evidence of a resolution between the Complainant and the
registry operator; (ii) evidence that registry operator’s lawsuit against Complainant has
been dismissed or withdrawn; or (iii) a copy of an order from the dispute resolution
provider selected pursuant to the Registry Agreement dismissing the dispute against
ICANN whether by reason of agreement of the parties or upon determination of the
merits.
21.4 The registry operator may challenge ICANN’s imposition of a remedy imposed in furtherance of an Expert Determination that the registry operator is liable under the PDDRP, to the extent a challenge is warranted, by initiating dispute resolution under the provisions of its Registry Agreement. Any arbitration shall be determined in accordance with the parties’ respective rights and duties under the Registry Agreement. Neither the Expert Determination nor the decision of ICANN to implement a remedy is intended to prejudice the registry operator in any way in the determination of the arbitration dispute. Any remedy involving a termination of the Registry Agreement must be according to the terms and conditions of the termination provision of the Registry Agreement.

21.5 Nothing herein shall be deemed to prohibit ICANN from imposing remedies at any time and of any nature it is otherwise entitled to impose for a registry operator’s non-compliance with its Registry Agreement.

22. Availability of Court or Other Administrative Proceedings

22.1 The Trademark PDDRP is not intended as an exclusive procedure and does not preclude individuals from seeking remedies in courts of law, including, as applicable, review of an Expert Determination as to liability.

22.2 In those cases where a Party submits documented proof to the Provider that a Court action involving the same Parties, facts and circumstances as the Trademark PDDRP was instituted prior to the filing date of the Complaint in the Trademark PDDRP, the Provider shall suspend or terminate the Trademark PDDRP.
1. **Parties to the Dispute**

The parties to the dispute will be the harmed established institution and the gTLD registry operator. ICANN shall not be a party.

2. **Applicable Rules**

2.1 This procedure is intended to cover these dispute resolution proceedings generally. To the extent more than one RRDRP provider (“Provider”) is selected to implement the RRDRP, each Provider may have additional rules and procedures that must be followed when filing a Complaint. The following are the general procedure to be followed by all Providers.

2.2 In any new community-based gTLD registry agreement, the registry operator shall be required to agree to participate in the RRDRP and be bound by the resulting Determinations.

3. **Language**

3.1 The language of all submissions and proceedings under the procedure will be English.

3.2 Parties may submit supporting evidence in their original language, provided and subject to the authority of the RRDRP Expert Panel to determine otherwise, that such evidence is accompanied by an English translation of all relevant text.

4. **Communications and Time Limits**

4.1 All communications with the Provider must be filed electronically.

4.2 For the purpose of determining the date of commencement of a time limit, a notice or other communication will be deemed to have been received on the day that it is transmitted to the appropriate contact person designated by the parties.

4.3 For the purpose of determining compliance with a time limit, a notice or other communication will be deemed to have been sent, made or transmitted on the day that it is dispatched.

---

1 Initial complaints that a Registry has failed to comply with registration restrictions shall be processed through a Registry Restriction Problem Report System (RRPRS) using an online form similar to the Whois Data Problem Report System (WDPRS) at InterNIC.net. A nominal processing fee could serve to decrease frivolous complaints. The registry operator shall receive a copy of the complaint and will be required to take reasonable steps to investigate (and remedy if warranted) the reported non-compliance. The Complainant will have the option to escalate the complaint in accordance with this RRDRP, if the alleged non-compliance continues. Failure by the Registry to address the complaint to complainant’s satisfaction does not itself give the complainant standing to file an RRDRP complaint.
4.4 For the purpose of calculating a period of time under this procedure, such period will begin to run on the day following the date of receipt of a notice or other communication.

4.5 All references to day limits shall be considered as calendar days unless otherwise specified.

5. **Standing**

5.1 The mandatory administrative proceeding will commence when a third-party complainant (“Complainant”) has filed a Complaint with a Provider asserting that the Complainant is a harmed established institution as a result of the community-based gTLD registry operator not complying with the registration restrictions set out in the Registry Agreement.

5.2 Established institutions associated with defined communities are eligible to file a community objection. The “defined community” must be a community related to the gTLD string in the application that is the subject of the dispute. To qualify for standing for a community claim, the Complainant must prove both: it is an established institution, and has an ongoing relationship with a defined community that consists of a restricted population that the gTLD supports.

5.3 Complainants must have filed a claim through the Registry Restriction Problem Report System (RRPRS) to have standing to file an RRDRP.

5.4 The Panel will determine standing and the Expert Determination will include a statement of the Complainant’s standing.

6. **Standards**

6.1 For a claim to be successful, the claims must prove that:

6.1.1 The community invoked by the objector is a defined community;

6.1.2 There is a strong association between the community invoked and the gTLD label or string;

6.1.3 The TLD operator violated the terms of the community-based restrictions in its agreement;

6.1.4 There is a measureable harm to the Complainant and the community named by the objector.

7. **Complaint**

7.1 Filing:
The Complaint will be filed electronically. Once the Administrative Review has been completed and the Provider deems the Complaint to be in compliance, the Provider will electronically serve the Complaint and serve a hard copy and fax notice on the registry operator consistent with the contact information listed in the Registry Agreement.

7.2 Content:

7.2.1 The name and contact information, including address, phone, and email address, of the Complainant, the registry operator and, to the best of Complainant’s knowledge, the name and address of the current owner of the registration.

7.2.2 The name and contact information, including address, phone, and email address of any person authorized to act on behalf of Complainant.

7.2.3 A statement of the nature of the dispute, which must include:

7.2.3.1 The particular registration restrictions in the Registry Agreement with which the registry operator is failing to comply; and

7.2.3.2 A detailed explanation of how the registry operator’s failure to comply with the identified registration restrictions has caused harm to the complainant.

7.2.4 A statement that the proceedings are not being brought for any improper purpose.

7.2.5 A statement that the Complainant has filed a claim through the RRPRS and that the RRPRS process has concluded.

7.2.6 A statement that Complainant has not filed a Trademark Post-Delegation Dispute Resolution Procedure (PDDRP) complaint relating to the same or similar facts or circumstances.

7.3 Complaints will be limited to 5,000 words and 20 pages, excluding attachments, unless the Provider determines that additional material is necessary.

7.4 Any supporting documents should be filed with the Complaint.

7.5 At the same time the Complaint is filed, the Complainant will pay a filing fee in the amount set in accordance with the applicable Provider rules. In the event that the filing fee is not paid within 10 days of the receipt of the Complaint by the Provider, the Complaint will be dismissed without prejudice to the Complainant to file another complaint.

8. Administrative Review of the Complaint

8.1 All Complaints will be reviewed within five (5) business days of submission by panelists designated by the applicable Provider to determine whether the Complainant has complied with the procedural rules.
8.2 If the Provider finds that the Complaint complies with procedural rules, the Complaint will be deemed filed, and the proceedings will continue. If the Provider finds that the Complaint does not comply with procedural rules, it will electronically notify the Complainant of such non-compliance and provide the Complainant five (5) business days to submit an amended Complaint. If the Provider does not receive an amended Complaint within the five (5) business days provided, it will dismiss the Complaint and close the proceedings without prejudice to the Complainant’s submission of a new Complaint that complies with procedural rules. Filing fees will not be refunded if the Complaint is deemed not in compliance.

8.3 If deemed compliant, the Provider will electronically serve the Complaint on the registry operator and serve a paper notice on the registry operator that is the subject of the Complaint consistent with the contact information listed in the Registry Agreement.

9. Response to the Complaint

9.1 The registry operator must file a response to each Complaint within thirty (30) days of service the Complaint.

9.2 The Response will comply with the rules for filing a Complaint and will contain the names and contact information for the registry operator, as well as a point by point response to the statements made in the Complaint.

9.3 The Response must be electronically filed with the Provider and the Provider must serve it upon the Complainant in electronic form with a hard-copy notice that it has been served.

9.4 Service of the Response will be deemed effective, and the time will start to run for a Reply, upon electronic transmission of the Response.

9.5 If the registry operator believes the Complaint is without merit, it will affirmatively plead in it Response the specific grounds for the claim.

9.6 At the same time the Response is filed, the registry operator will pay a filing fee in the amount set in accordance with the applicable Provider rules. In the event that the filing fee is not paid within ten (10) days of the receipt of the Response by the Provider, the Response will be deemed improper and not considered in the proceedings, but the matter will proceed to Determination.

10 Reply

10.1 The Complainant is permitted ten (10) days from Service of the Response to submit a Reply addressing the statements made in the Response showing why the Complaint is not “without merit.” A Reply may not introduce new facts or evidence into the record, but shall only be used to address statements made in the Response. Any new facts or evidence introduced in a Response shall be disregarded by the Expert Panel.

10.2 Once the Complaint, Response and Reply (as necessary) are filed and served, a Panel will be appointed and provided with all submissions.
11. Default

11.1 If the registry operator fails to respond to the Complaint, it will be deemed to be in default.

11.2 Limited rights to set aside the finding of default will be established by the Provider, but in no event will it be permitted absent a showing of good cause to set aside the finding of Default.

11.3 The Provider shall provide Notice of Default via email to the Complainant and registry operator.

11.4 All Default cases shall proceed to Expert Determination on the merits.

12. Expert Panel

12.1 The Provider shall select and appoint a single-member Expert Panel within (21) days after receiving the Reply, or if no Reply is filed, within 21 days after the Reply was due to be filed.

12.2 The Provider will appoint a one-person Expert Panel unless any party requests a three-member Expert Panel.

12.3 In the case where either party requests a three-member Expert Panel, each party (or each side of the dispute if a matter has been consolidated) shall select an Expert and the two selected Experts shall select the third Expert Panel member. Such selection shall be made pursuant to the Provider’s rules or procedures. RRDRP panelists within a Provider shall be rotated to the extent feasible.

12.4 Expert Panel members must be independent of the parties to the post-delegation challenge. Each Provider will follow its adopted procedures for requiring such independence, including procedures for challenging and replacing an Expert for lack of independence.

13. Costs

13.1 The Provider will estimate the costs for the proceedings that it administers under this procedure in accordance with the applicable Provider Rules. Such costs will cover the administrative fees, including the Filing and Response Fee, of the Provider, and the Expert Panel fees, and are intended to be reasonable.

13.2 The Complainant shall be required to pay the Filing fee as set forth above in the “Complaint” section, and shall be required to submit the full amount of the other Provider-estimated administrative fees, including the Response Fee, and the Expert Panel fees at the outset of the proceedings. Fifty percent of that full amount shall be in cash (or cash equivalent) to cover the Complainant’s share of the proceedings and the other 50% shall be in either cash (or cash equivalent), or in bond, to cover the registry operator’s share if the registry operator prevails.
13.3 If the Panel declares the Complainant to be the prevailing party, the registry operator is required to reimburse Complainant for all Panel and Provider fees incurred, including the Filing Fee. Failure to do shall be deemed a violation of the RRDRP and a breach of the Registry Agreement, subject to remedies available under the Agreement up to and including termination.

13.4 If the Panel declares the registry operator to be the prevailing party, the Provider shall reimburse the registry operator for its Response Fee.

14. Discovery/Evidence

14.1 In order to achieve the goal of resolving disputes rapidly and at a reasonable cost, discovery will generally not be permitted. In exceptional cases, the Expert Panel may require a party to provide additional evidence.

14.2 If permitted, discovery will be limited to that for which each Party has a substantial need.

14.3 Without a specific request from the Parties, but only in extraordinary circumstances, the Expert Panel may request that the Provider appoint experts to be paid for by the Parties, request live or written witness testimony, or request limited exchange of documents.

15. Hearings

15.1 Disputes under this RRDRP will usually be resolved without a hearing.

15.2 The Expert Panel may decide on its own initiative, or at the request of a party, to hold a hearing. However, the presumption is that the Expert Panel will render Determinations based on written submissions and without a hearing.

15.3 If a request for a hearing is granted, videoconferences or teleconferences should be used if at all possible. If not possible, then the Expert Panel will select a place for hearing if the parties cannot agree.

15.4 Hearings should last no more than one day, except in the most exceptional circumstances.

15.5 If the Expert Panel grants one party’s request for a hearing, notwithstanding the other party’s opposition, the Expert Panel is encouraged to apportion the hearing costs to the requesting party as the Expert Panel deems appropriate.

15.6 All dispute resolution proceedings will be conducted in English.

16. Burden of Proof

The Complainant bears the burden of proving its claim; the burden should be by a preponderance of the evidence.
17. **Recommended Remedies**

17.1 Since registrants of domain names registered in violation of the agreement restriction are not a party to the action, a recommended remedy cannot take the form of deleting, transferring or suspending registrations that were made in violation of the agreement restrictions (except to the extent registrants have been shown to be officers, directors, agents, employees, or entities under common control with a registry operator).

17.2 Recommended remedies will not include monetary damages or sanctions to be paid to any party other than fees awarded pursuant to section 13.

17.3 The Expert Panel may recommend a variety of graduated enforcement tools against the registry operator if the Expert Panel determines that the registry operator allowed registrations outside the scope of its promised limitations, including:

17.3.1 Remedial measures, which may be in addition to requirements under the registry agreement, for the registry to employ to ensure against allowing future registrations that do not comply with community-based limitations; except that the remedial measures shall not:

(a) Require the registry operator to monitor registrations not related to the names at issue in the RRDRP proceeding, or

(b) direct actions by the registry operator that are contrary to those required under the registry agreement

17.3.2 Suspension of accepting new domain name registrations in the gTLD until such time as the violation(s) identified in the Determination is(are) cured or a set period of time;

OR,

17.3.3 In extraordinary circumstances where the registry operator acted with malice providing for the termination of a registry agreement.

17.3 In making its recommendation of the appropriate remedy, the Expert Panel will consider the ongoing harm to the Complainant, as well as the harm the remedies will create for other, unrelated, good faith domain name registrants operating within the gTLD.

18. **The Expert Determination**

18.1 The Provider and the Expert Panel will make reasonable efforts to ensure that the Expert Determination is rendered within 45 days of the appointment of the Expert Panel and absent good cause, in no event later than 60 days after the appointment of the Expert Panel.

18.2 The Expert Panel will render a written Determination. The Expert Determination will state whether or not the Complaint is factually founded and provide the reasons for its
Determination. The Expert Determination should be publicly available and searchable on the Provider’s web site.

18.3 The Expert Determination may further include a recommendation of specific remedies. Costs and fees to the Provider, to the extent not already paid, will be paid within thirty (30) days of the Expert Determination.

18.4 The Expert Determination shall state which party is the prevailing party.

18.5 While the Expert Determination that a community-based restricted gTLD registry operator was not meeting its obligations to police the registration and use of domains within the applicable restrictions shall be considered, ICANN shall have the authority to impose the remedies ICANN deems appropriate, given the circumstances of each matter.

19. **Appeal of Expert Determination**

19.1 Either party shall have a right to seek a de novo appeal of the Expert Determination based on the existing record within the RRDRP proceeding for a reasonable fee to cover the costs of the appeal.

19.2 An appeal must be filed with the Provider and served on all parties within 20 days after an Expert Determination is issued and a response to the appeal must be filed within 20 days after the appeal. Manner and calculation of service deadlines shall in consistent with those set forth in Section 4 above, “Communication and Time Limits.”

19.3 A three-member Appeal Panel is to be selected by the Provider, but no member of the Appeal Panel shall also have been an Expert Panel member.

19.4 The fees for an appeal in the first instance shall be borne by the appellant.

19.5 A limited right to introduce new admissible evidence that is material to the Determination will be allowed upon payment of an additional fee, provided the evidence clearly pre-dates the filing of the Complaint.

19.6 The Appeal Panel may request at its sole discretion, further statements or evidence from any party regardless of whether the evidence pre-dates the filing of the Complaint if the Appeal Panel determines such evidence is relevant.

19.7 The prevailing party shall be entitled to an award of costs of appeal.

19.8 The Provider’s rules and procedures for appeals, other than those stated above, shall apply.

20. **Breach**

20.1 If the Expert determines that the registry operator is in breach, ICANN will then proceed to notify the registry operator that it is in breach. The registry operator will be given the opportunity to cure the breach as called for in the Registry Agreement.

RRDRP-8
20.2 If registry operator fails to cure the breach then both parties are entitled to utilize the options available to them under the registry agreement, and ICANN may consider the recommended remedies set forth in the Expert Determination when taking action.

20.3 Nothing herein shall be deemed to prohibit ICANN from imposing remedies at any time and of any nature it is otherwise entitled to impose for a registry operator’s non-compliance with its Registry Agreement.

21. **Availability of Court or Other Administrative Proceedings**

21.1 The RRDRP is not intended as an exclusive procedure and does not preclude individuals from seeking remedies in courts of law, including, as applicable, review of an Expert Determination as to liability.

21.2 The parties are encouraged, but not required to participate in informal negotiations and/or mediation at any time throughout the dispute resolution process but the conduct of any such settlement negotiation is not, standing alone, a reason to suspend any deadline under the proceedings.
Module 6

Top-Level Domain Application - Terms and Conditions

By submitting this application through ICANN’s online interface for a generic Top Level Domain (gTLD) (this application), applicant (including all parent companies, subsidiaries, affiliates, agents, contractors, employees and any and all others acting on its behalf) agrees to the following terms and conditions (these terms and conditions) without modification. Applicant understands and agrees that these terms and conditions are binding on applicant and are a material part of this application.

1. Applicant warrants that the statements and representations contained in the application (including any documents submitted and oral statements made and confirmed in writing in connection with the application) are true and accurate and complete in all material respects, and that ICANN may rely on those statements and representations fully in evaluating this application. Applicant acknowledges that any material misstatement or misrepresentation (or omission of material information) may cause ICANN and the evaluators to reject the application without a refund of any fees paid by Applicant. Applicant agrees to notify ICANN in writing of any change in circumstances that would render any information provided in the application false or misleading.

2. Applicant warrants that it has the requisite organizational power and authority to make this application on behalf of applicant, and is able to make all agreements, representations, waivers, and understandings stated in these terms and conditions and to enter into the form of registry agreement as posted with these terms and conditions.

3. Applicant acknowledges and agrees that ICANN has the right to determine not to proceed with any and all applications for new gTLDs, and that there is no assurance that any additional gTLDs will be created. The decision to review, consider and approve an application to establish one or more
gTLDs and to delegate new gTLDs after such approval is entirely at ICANN’s discretion. ICANN reserves the right to reject any application that ICANN is prohibited from considering under applicable law or policy, in which case any fees submitted in connection with such application will be returned to the applicant.

4. Applicant agrees to pay all fees that are associated with this application. These fees include the evaluation fee (which is to be paid in conjunction with the submission of this application), and any fees associated with the progress of the application to the extended evaluation stages of the review and consideration process with respect to the application, including any and all fees as may be required in conjunction with the dispute resolution process as set forth in the application. Applicant acknowledges that the initial fee due upon submission of the application is only to obtain consideration of an application. ICANN makes no assurances that an application will be approved or will result in the delegation of a gTLD proposed in an application. Applicant acknowledges that if it fails to pay fees within the designated time period at any stage of the application review and consideration process, applicant will forfeit any fees paid up to that point and the application will be cancelled. Except as expressly provided in this Application Guidebook, ICANN is not obligated to reimburse an applicant for or to return any fees paid to ICANN in connection with the application process.

5. Applicant shall indemnify, defend, and hold harmless ICANN (including its affiliates, subsidiaries, directors, officers, employees, consultants, evaluators, and agents, collectively the ICANN Affiliated Parties) from and against any and all third-party claims, damages, liabilities, costs, and expenses, including legal fees and expenses, arising out of or relating to: (a) ICANN’s or an ICANN Affiliated Party’s consideration of the application, and any approval rejection or withdrawal of the application; and/or (b) ICANN’s or an ICANN Affiliated Party’s reliance on information provided by applicant in the application.
6. Applicant hereby releases ICANN and the ICANN Affiliated Parties from any and all claims by applicant that arise out of, are based upon, or are in any way related to, any action, or failure to act, by ICANN or any ICANN Affiliated Party in connection with ICANN’s or an ICANN Affiliated Party’s review of this application, investigation or verification, any characterization or description of applicant or the information in this application, any withdrawal of this application or the decision by ICANN to recommend, or not to recommend, the approval of applicant’s gTLD application. Applicant agrees not to challenge, in court or in any other judicial fora, any final decision made by ICANN with respect to the application, and irrevocably waives any right to sue or proceed in court or any other judicial fora on the basis of any other legal claim against ICANN and ICANN Affiliated Parties with respect to the application. Applicant acknowledges and accepts that applicant’s nonentitlement to pursue any rights, remedies, or legal claims against ICANN or the ICANN Affiliated Parties in court or any other judicial fora with respect to the application shall mean that applicant will forego any recovery of any application fees, monies invested in business infrastructure or other startup costs and any and all profits that applicant may expect to realize from the operation of a registry for the TLD; provided, that applicant may utilize any accountability mechanism set forth in ICANN’s Bylaws for purposes of challenging any final decision made by ICANN with respect to the application. Applicant acknowledges that any ICANN Affiliated Party is an express third party beneficiary of this Section 6 and may enforce each provision of this Section 6 against applicant.

7. Applicant hereby authorizes ICANN to publish on ICANN’s website, and to disclose or publicize in any other manner, any materials submitted to, or obtained or generated by, ICANN and the ICANN Affiliated Parties in connection with the application, including evaluations, analyses and any other
materials prepared in connection with the evaluation of the application; provided, however, that information will not be disclosed or published to the extent that this Applicant Guidebook expressly states that such information will be kept confidential, except as required by law or judicial process. Except for information afforded confidential treatment, applicant understands and acknowledges that ICANN does not and will not keep the remaining portion of the application or materials submitted with the application confidential.

8. Applicant certifies that it has obtained permission for the posting of any personally identifying information included in this application or materials submitted with this application. Applicant acknowledges that the information that ICANN posts may remain in the public domain in perpetuity, at ICANN’s discretion. Applicant acknowledges that ICANN will handle personal information collected in accordance with its gTLD Program privacy statement http://newgtlds.icann.org/en/applicants/agb/program-privacy, which is incorporated herein by this reference. If requested by ICANN, Applicant will be required to obtain and deliver to ICANN and ICANN's background screening vendor any consents or agreements of the entities and/or individuals named in questions 1-11 of the application form necessary to conduct these background screening activities. In addition, Applicant acknowledges that to allow ICANN to conduct thorough background screening investigations:

a. Applicant may be required to provide documented consent for release of records to ICANN by organizations or government agencies;

b. Applicant may be required to obtain specific government records directly and supply those records to ICANN for review;

c. Additional identifying information may be required to resolve questions of identity of individuals within the applicant organization;
d. Applicant may be requested to supply certain information in the original language as well as in English.

9. Applicant gives ICANN permission to use applicant’s name in ICANN’s public announcements (including informational web pages) relating to Applicant’s application and any action taken by ICANN related thereto.

10. Applicant understands and agrees that it will acquire rights in connection with a gTLD only in the event that it enters into a registry agreement with ICANN, and that applicant’s rights in connection with such gTLD will be limited to those expressly stated in the registry agreement. In the event ICANN agrees to recommend the approval of the application for applicant’s proposed gTLD, applicant agrees to enter into the registry agreement with ICANN in the form published in connection with the application materials. (Note: ICANN reserves the right to make reasonable updates and changes to this proposed draft agreement during the course of the application process, including as the possible result of new policies that might be adopted during the course of the application process). Applicant may not resell, assign, or transfer any of applicant’s rights or obligations in connection with the application.

11. Applicant authorizes ICANN to:

   a. Contact any person, group, or entity to request, obtain, and discuss any documentation or other information that, in ICANN’s sole judgment, may be pertinent to the application;

   b. Consult with persons of ICANN’s choosing regarding the information in the application or otherwise coming into ICANN’s possession, provided, however, that ICANN will use reasonable efforts to ensure that such persons maintain the confidentiality of information in the application that this Applicant Guidebook expressly states will be kept confidential.
12. For the convenience of applicants around the world, the application materials published by ICANN in the English language have been translated into certain other languages frequently used around the world. Applicant recognizes that the English language version of the application materials (of which these terms and conditions is a part) is the version that binds the parties, that such translations are non-official interpretations and may not be relied upon as accurate in all respects, and that in the event of any conflict between the translated versions of the application materials and the English language version, the English language version controls.

13. Applicant understands that ICANN has a long-standing relationship with Jones Day, an international law firm, and that ICANN intends to continue to be represented by Jones Day throughout the application process and the resulting delegation of TLDs. ICANN does not know whether any particular applicant is or is not a client of Jones Day. To the extent that Applicant is a Jones Day client, by submitting this application, Applicant agrees to execute a waiver permitting Jones Day to represent ICANN adverse to Applicant in the matter. Applicant further agrees that by submitting its Application, Applicant is agreeing to execute waivers or take similar reasonable actions to permit other law and consulting firms retained by ICANN in connection with the review and evaluation of its application to represent ICANN adverse to Applicant in the matter.

14. ICANN reserves the right to make reasonable updates and changes to this applicant guidebook and to the application process, including the process for withdrawal of applications, at any time by posting notice of such updates and changes to the ICANN website, including as the possible result of new policies that might be adopted or advice to ICANN from ICANN advisory committees during the course of the application process. Applicant acknowledges that ICANN may make such updates and changes and agrees that its application will be subject to any such updates and changes. In the event that Applicant has completed and submitted its application prior to
such updates or changes and Applicant can demonstrate to ICANN that compliance with such updates or changes would present a material hardship to Applicant, then ICANN will work with Applicant in good faith to attempt to make reasonable accommodations in order to mitigate any negative consequences for Applicant to the extent possible consistent with ICANN's mission to ensure the stable and secure operation of the Internet's unique identifier systems.
ICC Practice Note on the Administration of Cases under the New gTLD Dispute Resolution Procedure

The ICC International Centre for Expertise (“Centre”), named as Dispute Resolution Service Provider (“DRSP”) in the New gTLD Dispute Resolution Procedure1 (“Procedure”), has accepted ICANN’s invitation to be one of the DRSPs administering cases pursuant to the Procedure.

The Centre will administer these proceedings pursuant to the Procedure and the Rules for Expertise of the ICC2 (“ICC Rules”), including Article 17, which shall be interpreted in accordance with this Practice Note on the Administration of Cases under the Procedure (“Practice Note”).

This Practice Note shall be considered as a supplement to the ICC Rules as mentioned by Article 4 of the Procedure.

In accordance with Article 1(d) of the Procedure, anyone filing an application for a new gTLD with ICANN has accepted the application of the ICC Rules and the Practice Note.

1. All documents and notifications shall be submitted by e-mail only to expertise@iccwbo.org, unless decided otherwise by the Centre or the expert(s);

2. Hardcopies of documents may be submitted only, when a party is explicitly invited by the Centre or the expert(s) to do so (Article 10 ICC Rules);

3. For the purpose of determining time limits, a document shall be deemed to have been submitted or a notification shall be deemed to have been made on the day it was transmitted pursuant to Article 6(c) of the Procedure (Article 10(3) ICC Rules);

4. A party wishing to file an objection shall use the model form provided by the Centre on its webpage (Article 9(3) ICC Rules);

5. A party wishing to file a response shall use the model form provided by the Centre on its webpage;

1 Version 2012-01-11
2 In force as from 1 January 2003

ICC International Centre for ADR • Centre international d’ADR de la CCI
38 Cours Albert 1er, 75008 Paris, France
Tel +33 (0)1 49 53 30 52 Fax +33 (0)1 49 53 30 49
© International Chamber of Commerce (ICC) March 2012. All rights reserved. No part of this document may be reproduced or copied in any form or by any means, or translated, without the prior permission in writing of ICC.
6. By accepting the process as defined in Article 1(d) of the Procedure, parties are
deemed to have waived the requirements for the expert mission as set out in
Article 12(1) of the ICC Rules;

7. The Centre shall not be required to state reasons for its procedural decisions;

8. By accepting the process as defined in Article 1(d) of the Procedure, parties are
deemed to have agreed that the expert determination shall be binding upon the parties
(Article 12(3) ICC Rules);

9. Challenges and replacements of an expert shall be dealt with in accordance with
Article 11(4) of the ICC Rules. They must be filed within five (5) days from the
notification of the appointment of the expert or from the date when the party making
the challenge was informed of the facts or circumstances on which the challenge is
based;

10. Pursuant to Article 13(b)(iii) of the Procedure three experts shall be appointed in
proceedings involving a Limited Public Interest Objection. One expert shall act as
president, the two others as co-experts;

11. Unless otherwise agreed by the parties, the ICC ADR Rules shall apply to any request for
mediation made by any of the parties;

12. Unless otherwise agreed by the parties and the Centre, the expert report shall be
subMITTED to the parties by e-mail only;

13. For the purpose of administering proceedings pursuant to the Procedure, Article 3 of
Appendix II referred to in Article 14 of the ICC Rules is modified as set out in
Appendix III to the Rules;

14. The non-refundable amount payable pursuant to Article 14 of the ICC Rules, shall be
considered as the filing fee pursuant to Articles 7 and 11 of the Procedure. If considered
appropriate to do so, the Centre can refund this amount to a party.

11(c). Name(s) and position(s) of all shareholders holding at least 15% of shares

Amazon Europe Holding Technologies S.C.S [Not Applicable]

11(d). For an applying entity that does not have directors, officers, partners, or shareholders: Name(s) and position(s) of all individuals having legal or executive responsibility

Applied-for gTLD string

13. Provide the applied-for gTLD string. If an IDN, provide the U-label.

AMAZON

14(a). If an IDN, provide the A-label (beginning with "xn--").

14(b). If an IDN, provide the meaning or restatement of the string in English, that is, a description of the literal meaning of the string in the opinion of the applicant.

14(c). If an IDN, provide the language of the label (in English).

14(c). If an IDN, provide the language of the label (as referenced by ISO-639-1).

14(d). If an IDN, provide the script of the label (in English).

14(d). If an IDN, provide the script of the label (as referenced by ISO 15924).
14(e). If an IDN, list all code points contained in the U-label according to Unicode form.

15(a). If an IDN, Attach IDN Tables for the proposed registry.

Attachments are not displayed on this form.

15(b). Describe the process used for development of the IDN tables submitted, including consultations and sources used.

15(c). List any variant strings to the applied-for gTLD string according to the relevant IDN tables.

16. Describe the applicant’s efforts to ensure that there are no known operational or rendering problems concerning the applied-for gTLD string. If such issues are known, describe steps that will be taken to mitigate these issues in software and other applications.

Neustar, Amazon EU S.à r.l.’s provider of back end registry services, confirms that it does not anticipate any problems in the operation or rendering of this ASCII string. The string conforms to accepted standards and poses no threat to the operational security and stability of the Internet.

17. (OPTIONAL) Provide a representation of the label according to the International Phonetic Alphabet (http://www.langsci.ucl.ac.uk/ipa/).

Mission/Purpose

18(a). Describe the mission/purpose of your proposed gTLD.

Founded in 1994, Amazon opened on the World Wide Web in July 1995 and today offers Earth’s Biggest Selection. Amazon seeks to be Earth’s most customer-centric company, where customers can find and discover anything they might want to buy
online, and endeavors to offer its customers the lowest possible prices. Amazon and other sellers offer millions of unique new, refurbished and used items in categories such as Books; Movies, Music & Games; Digital Downloads; Electronics & Computers; Home & Garden; Toys, Kids & Baby; Grocery; Apparel, Shoes & Jewelry; Health & Beauty; Sports & Outdoors; and Tools, Auto & Industrial. Amazon Web Services provides Amazon’s developer customers with access to in-the-cloud infrastructure services based on Amazon’s own back-end technology platform, which developers can use to enable virtually any type of business. The new latest generation Kindle is the lightest, most compact Kindle ever and features the same 6-inch, most advanced electronic ink display that reads like real paper even in bright sunlight. Kindle Touch is a new addition to the Kindle family with an easy-to-use touch screen that makes it easier than ever to turn pages, search, shop, and take notes – still with all the benefits of the most advanced electronic ink display. Kindle Touch 3G is the top of the line e-reader and offers the same new design and features of Kindle Touch, with the unparalleled added convenience of free 3G. Kindle Fire is the Kindle for movies, TV shows, music, books, magazines, apps, games and web browsing with all the content, free storage in the Amazon Cloud, Whispersync, Amazon Silk (Amazon’s new revolutionary cloud-accelerated web browser), vibrant color touch screen, and powerful dual-core processor.

The mission of the .AMAZON registry is:
To provide a unique and dedicated platform for Amazon while simultaneously protecting the integrity of its brand and reputation.
A .AMAZON registry will:

- Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
- Provide Amazon a further platform for innovation.
- Enable Amazon to protect its intellectual property rights.

18(b). How do you expect that your proposed gTLD will benefit registrants, Internet users, and others?

The .AMAZON registry will benefit registrants and internet users by offering a stable and secure foundation for online communication and interaction.

What is the goal of your proposed gTLD in terms of areas of specialty, service levels or reputation?
Amazon intends for its new .AMAZON gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction. The .AMAZON registry will be run in line with current industry standards of good registry practice.
What do you anticipate your proposed gTLD will add to the current space in terms of competition, differentiation or innovation?
Amazon values the opportunity to be one of the first companies to own a gTLD.
A .AMAZON registry will:

- Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
- Provide Amazon a further platform for innovation.
- Enable Amazon to protect its intellectual property rights.

What goals does your proposed gTLD have in terms of user experience?
Amazon intends for its new .AMAZON gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction.

Provide a complete description of the applicant’s intended registration policies in support of the goals above.
Amazon’s Intellectual Property group will be responsible for the development, maintenance and enforcement of a Domain Management Policy. The Domain Management
Policy will define (i) the rules associated with eligibility and domain name allocation, (ii) the license terms governing the use of a .AMAZON domain name, and (iii) the dispute resolution policies for the .AMAZON gTLD. Amazon will continually update the Domain Management Policy as needed to reflect Amazon’s business goals and, where appropriate, ICANN consensus policies.

Registration of a domain name in the .AMAZON registry will be undertaken in four steps: (i) Eligibility Confirmation, (ii) Naming Convention Check, (iii) Acceptable Use Review, and (iv) Registration. All domains in the .AMAZON registry will remain the property of Amazon.

For example, on the rules of eligibility, each applied for character string must conform to the .AMAZON rules of eligibility. Each .AMAZON name must:

- be at least 3 characters and no more than 63 characters long
- not contain a hyphen on the 3rd and 4th position (tagged domains)
- contain only letters (a-z), numbers (0-9) and hyphens or a combination of these
- start and end with an alphanumeric character, not a hyphen
- not match any character strings reserved by ICANN
- not match any protected country names or geographical terms

Additionally:

- Internationalized domain names (IDN) may be supported in the .AMAZON registry at the second level.
- The .AMAZON registry will respect third party intellectual property rights.
- .AMAZON domains may not be delegated or assigned to third party organizations, institutions, or individuals.
- All .AMAZON domains will carry accurate and up-to-date registration records. Amazon’s Intellectual Property group reserves the right to revoke a license to use a .AMAZON domain name, at any time, if any use of a .AMAZON domain name violates the Domain Management Policy.

Will your proposed gTLD impose any measures for protecting the privacy of confidential information of registrants or users? Yes. Amazon will implement appropriate privacy policies respecting requirements of local jurisdictions. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.

Describe whether and in what ways outreach and communications will help to achieve your projected benefits? There is no foreseeable reason for Amazon to undertake public outreach or mass communication about its new gTLD registry because domains will be provisioned in line with Amazon’s business goals.

18(c). What operating rules will you adopt to eliminate or minimize social costs?

Amazon intends to initially provision a relatively small number of domains in the .AMAZON registry to support the business goals of Amazon. These initiatives should not impose social costs of any type on consumers.

How will multiple applications for a particular domain be resolved, for example, by auction or on a first come first served basis?

Applications from Amazon and its subsidiaries for domains in the .AMAZON registry will be considered by Amazon’s Intellectual Property group and allocated in line with Amazon’s business goals. The .AMAZON registry will not be promoted by hundreds of registrars simultaneously, so there will not be multiple-applications for a particular domain.

Explain any cost benefits for registrants you intend to implement (e.g. advantageous pricing, introductory discounts, bulk registration discounts).

Domains in the .AMAZON registry will be provisioned to support the business goals of Amazon. Accordingly, “cost benefits” may be explored depending on the business goals of Amazon. Amazon shares the goals of enhancing customer trust and choice. The Registry Agreement requires that registrars be offered the option to obtain initial domain name registrations for periods of one to ten years at the discretion
of the registrar, but no greater than 10 years. Additionally the Registry Agreement requires advance written notice of price increases. Do you intend to make contractual commitments to registrants regarding the magnitude of price escalation? The Domain Management Policy will include the costs and benefits of Amazon’s unique and dedicated platform for stable and secure online communication and interaction.

Community-based Designation

19. Is the application for a community-based TLD?  
No

20(a). Provide the name and full description of the community that the applicant is committing to serve.

20(b). Explain the applicant's relationship to the community identified in 20(a).

20(c). Provide a description of the community-based purpose of the applied-for gTLD.

20(d). Explain the relationship between the applied-for gTLD string and the community identified in 20(a).

20(e). Provide a description of the applicant's intended registration policies in support of the community-based purpose of the applied-for gTLD.

20(f). Attach any written endorsements from institutions/groups representative of the community identified in 20(a).

Attachments are not displayed on this form.
Geographic Names

21(a). Is the application for a geographic name?

No

Protection of Geographic Names

22. Describe proposed measures for protection of geographic names at the second and other levels in the applied-for gTLD.

Amazon EU S.à r.l., with support of its ultimate parent company, Amazon.com, Inc. (collectively referred to in this response throughout as “Amazon”), is committed to managing the .AMAZON registry in full compliance with all applicable laws, consensus policies, ICANN guidelines, RFCs and the Specifications of the Registry Agreement. In the management of domain names in the .AMAZON registry, based on GAC advice and Specification 5, Amazon intends to block from initial registration those country and territory names contained in the following lists:

1. The short form (in English) of all country and territory names contained on the ISO 3166-1 list, as updated from time to time, including the European Union; and
2. The United Nations Group of Experts on Geographical Names, Technical Reference Manual for the Standardization of Geographical Names, Part III Names of Countries of the World; and

The process for reserving these names, and hence blocking them from registration, will be agreed to with our technical service provider Neustar.

Because the .AMAZON registry will be a single entity registry and for purposes which serve Amazon’s strategic business aims, the reserved names cannot be offered to Governments or other official bodies for their own use as this would conflict with the mission and purpose of the gTLD. However, for the same reason, they will not be offered to third parties.

The .AMAZON registry only provides for the registration of names at the second level. No third level domains will be delegated at the registry level. It is consistent with GAC advice that Amazon may choose to create sub domains using country names or abbreviations at the third level. For example, Amazon may register intranet.amazon and its internal users may create sub domains such as us.intranet.amazon or uk.intranet.amazon.

Amazon may also use a folder structure to represent country names in its URLs, while the block exists at the second level. For example, intranet.amazon/germany or intranet.amazon/uk.

We imagine that over time, there will be demand from brand gTLDs leading to the
development of a standardized process for requesting GAC review and ICANN approval for the release of country and territory names for registration by the Registry Operator when the registry is a single entity registry. When such a process is in place, Amazon expects to apply for the release of country and territory names within .AMAZON.

Registry Services

23. Provide name and full description of all the Registry Services to be provided.

23.1 Introduction

Amazon EU S.à r.l. has elected to partner with Neustar, Inc. to provide back-end services for the .AMAZON registry. In making this decision, Amazon EU S.à r.l. recognized that Neustar already possesses a production-proven registry system that can be quickly deployed and smoothly operated over its robust, flexible, and scalable world-class infrastructure. The existing registry services will be leveraged for the .AMAZON registry. The following section describes the registry services to be provided.

23.2 Standard Technical and Business Components

Neustar will provide the highest level of service while delivering a secure, stable and comprehensive registry platform. Amazon EU S.à r.l. will use Neustar’s Registry Services platform to deploy the .AMAZON registry, by providing the following Registry Services (none of these services are offered in a manner that is unique to .AMAZON).

- Registry-Registrar Shared Registration Service (SRS)
- Extensible Provisioning Protocol (EPP)
- Domain Name System (DNS)
- WHOIS
- DNSSEC
- Data Escrow
- Dissemination of Zone Files using Dynamic Updates
- Access to Bulk Zone Files
- Dynamic WHOIS Updates
- IPv6 Support
- Rights Protection Mechanisms
- Internationalized Domain Names (IDN).

The following is a description of each of the services.

SRS

Neustar’s secure and stable SRS is a production-proven, standards-based, highly reliable, and high-performance domain name registration and management system. The SRS includes an EPP interface for receiving data from registrars for the purpose of provisioning and managing domain names and name servers. The response to Question 24 provides specific SRS information.

EPP

The .AMAZON registry will use the Extensible Provisioning Protocol (EPP) for the provisioning of domain names. The EPP implementation will be fully compliant with all RFCs. Registrars are provided with access via an EPP API and an EPP based Web GUI. With more than 10 gTLD, ccTLD, and private TLDs implementations, Neustar has extensive experience building EPP-based registries. Additional discussion on the EPP approach is presented in the response to Question 25.

DNS

Amazon EU S.à r.l. will leverage Neustar’s world-class DNS network of geographically
distributed nameserver sites to provide the highest level of DNS service. The service utilizes “Anycast” routing technology, and supports both IPv4 and IPv6. The DNS network is highly proven, and currently provides service to over 20 TLDs and thousands of enterprise companies. Additional information on the DNS solution is presented in the response to Questions 35.

WHOIS

Neustar’s existing standard WHOIS solution will be used for .AMAZON. The service provides supports for near real-time dynamic updates. The design and construction is agnostic with regard to data display policy is flexible enough to accommodate any data model. In addition, a searchable WHOIS service that complies with all ICANN requirements will be provided. The following WHOIS options will be provided:

- Standard WHOIS (Port 43)
- Standard WHOIS (Web)
- Searchable WHOIS (Web)

DNSSEC

An RFC compliant DNSSEC implementation will be provided using existing DNSSEC capabilities. Neustar is an experienced provider of DNSSEC services, and currently manages signed zones for three large top level domains: .biz, .us, and .co. Registrars are provided with the ability to submit and manage DS records using EPP, or through a web GUI. Additional information on DNSSEC, including the management of security extensions is found in the response to Question 43.

Data Escrow

Data escrow will be performed in compliance with all ICANN requirements in conjunction with an approved data escrow provider. The data escrow service will:

- Protect against data loss
- Follow industry best practices
- Ensure easy, accurate, and timely retrieval and restore capability in the event of a hardware failure
- Minimizes the impact of software or business failure

Additional information on the Data Escrow service is provided in the response to Question 38.

Dissemination of Zone Files using Dynamic Updates

Dissemination of zone files will be provided through a dynamic, near real-time process. Updates will be performed within the specified performance levels. The proven technology ensures that updates pushed to all nodes within a few minutes of the changes being received by the SRS. Additional information on the DNS updates may be found in the response to Question 35.

Access to Bulk Zone Files

Amazon EU S.à r.l. will provide third party access to the bulk zone file in accordance with specification 4, Section 2 of the Registry Agreement. Credentialing and dissemination of the zone files will be facilitated through the Central Zone Data Access Provider.

Dynamic WHOIS Updates

Updates to records in the WHOIS database will be provided via dynamic, near real-time updates. Guaranteed delivery message oriented middleware is used to ensure each individual WHOIS server is refreshed with dynamic updates. This component ensures that all WHOIS servers are kept current as changes occur in the SRS, while also decoupling WHOIS from the SRS. Additional information on WHOIS updates is presented in response to Question 26.

IPv6 Support

The .AMAZON registry will provide IPv6 support in the following registry services: SRS, WHOIS, and DNS-DNSSEC. In addition, the registry supports the provisioning of IPv6 AAAA records. A detailed description on IPv6 is presented in the response to Question 36.

Required Rights Protection Mechanisms

Amazon EU S.à r.l. will provide all ICANN required Rights Mechanisms, including:

- Trademark Claims Service
- Trademark Post-Delegation Dispute Resolution Procedure (PDDRP)
- Registration Restriction Dispute Resolution Procedure (RRDRP)
- UDRP
- URS
- Sunrise service.
More information is presented in the response to Question 29.

Internationalized Domain Names (IDN)

IDN registrations are provided in full compliance with the IDNA protocol. Neustar possesses extensive experience offering IDN registrations in numerous TLDs, and its IDN implementation uses advanced technology to accommodate the unique bundling needs of certain languages. Character mappings are easily constructed to block out characters that may be deemed as confusing to users. A detailed description of the IDN implementation is presented in response to Question 44.

23.3 Unique Services
Amazon EU S.à r.l. will not be offering services that are unique to .AMAZON.

23.4 Security or Stability Concerns
All services offered are standard registry services that have no known security or stability concerns. Neustar has demonstrated a strong track record of security and stability within the industry.

Demonstration of Technical & Operational Capability

24. Shared Registration System (SRS) Performance

24.1 Introduction
Amazon EU S.à r.l. has partnered with Neustar, Inc., an experienced TLD registry operator, for the operation of the .AMAZON Registry. Amazon EU S.à r.l. is confident that the plan in place for the operation of a robust and reliable Shared Registration System (SRS) as currently provided by Neustar will satisfy the criterion established by ICANN. Neustar built its SRS from the ground up as an EPP based platform and has been operating it reliably and at scale since 2001. The software currently provides registry services to five TLDs (.BIZ, .US, TEL, .CO and .TRAVEL) and is used to provide gateway services to the .CN and .TW registries. Neustar’s state of the art registry has a proven track record of being secure, stable, and robust. It manages more than 6 million domains, and has over 300 registrars connected today. The following describes a detailed plan for a robust and reliable SRS that meets all ICANN requirements including compliance with Specifications 6 and 10.

24.2 The Plan for Operation of a Robust and Reliable SRS

High-level SRS System Description
The SRS to be used for .AMAZON will leverage a production-proven, standards-based, highly reliable and high-performance domain name registration and management system that fully meets or exceeds the requirements as identified in the new gTLD Application Guidebook. The SRS is the central component of any registry implementation and its quality, reliability and capabilities are essential to the overall stability of the TLD. Neustar has a documented history of deploying SRS implementations with proven and verifiable performance, reliability and availability. The SRS adheres to all industry standards and protocols. By leveraging an existing SRS platform, Amazon EU S.à r.l. is mitigating the significant risks and costs associated with the development of a new system. Highlights of the SRS include:

- State-of-the-art, production proven multi-layer design
- Ability to rapidly and easily scale from low to high volume as a TLD grows
- Fully redundant architecture at two sites
- Support for IDN registrations in compliance with all standards
- Use by over 300 Registrars
- EPP connectivity over IPv6
Performance being measured using 100% of all production transactions (not sampling).

SRS Systems, Software, Hardware, and Interoperability
The systems and software that the registry operates on are a critical element to providing a high quality of service. If the systems are of poor quality, if they are difficult to maintain and operate, or if the registry personnel are unfamiliar with them, the registry will be prone to outages. Neustar has a decade of experience operating registry infrastructure to extremely high service level requirements. The infrastructure is designed using best of breed systems and software. Much of the application software that performs registry-specific operations was developed by the current engineering team and as a result the team is intimately familiar with its operations.

The architecture is highly scalable and provides the same high level of availability and performance as volumes increase. It combines load balancing technology with scalable server technology to provide a cost effective and efficient method for scaling.

The Registry is able to limit the ability of any one registrar from adversely impacting other registrars by consuming too many resources due to excessive EPP transactions. The system uses network layer 2 level packet shaping to limit the number of simultaneous connections registrars can open to the protocol layer.

All interaction with the Registry is recorded in log files. Log files are generated at each layer of the system. These log files record at a minimum:

- The IP address of the client
- Timestamp
- Transaction Details
- Processing Time.

In addition to logging of each and every transaction with the SRS Neustar maintains audit records, in the database, of all transformational transactions. These audit records allow the Registry, in support of Amazon EU S.à r.l., to produce a complete history of changes for any domain name.

SRS Design
The SRS incorporates a multi-layer architecture that is designed to mitigate risks and easily scale as volumes increase. The three layers of the SRS are:

- Protocol Layer
- Business Policy Layer
- Database.

Each of the layers is described below.

Protocol Layer
The first layer is the protocol layer, which includes the EPP interface to registrars. It consists of a high availability farm of load-balanced EPP servers. The servers are designed to be fast processors of transactions. The servers perform basic validations and then feed information to the business policy engines as described below. The protocol layer is horizontally scalable as dictated by volume.

The EPP servers authenticate against a series of security controls before granting service, as follows:

- The registrar’s host exchanges keys to initiates a TLS handshake session with the EPP server.
- The registrar’s host must provide credentials to determine proper access levels.
- The registrar’s IP address must be preregistered in the network firewalls and traffic-shapers.

Business Policy Layer
The Business Policy Layer is the “brain” of the registry system. Within this layer, the policy engine servers perform rules-based processing as defined through configurable attributes. This process takes individual transactions, applies various validation and policy rules, persists data and dispatches notification through the central database in order to publish to various external systems. External systems fed by the Business Policy Layer include backend processes such as dynamic update of DNS, WHOIS and Billing.

Similar to the EPP protocol farm, the SRS consists of a farm of application servers within this layer. This design ensures that there is sufficient capacity to process
every transaction in a manner that meets or exceeds all service level requirements. Some registries couple the business logic layer directly in the protocol layer or within the database. This architecture limits the ability to scale the registry. Using a decoupled architecture enables the load to be distributed among farms of inexpensive servers that can be scaled up or down as demand changes. The SRS today processes over 30 million EPP transactions daily.

Database
The database is the third core components of the SRS. The primary function of the SRS database is to provide highly reliable, persistent storage for all registry information required for domain registration services. The database is highly secure, with access limited to transactions from authenticated registrars, trusted application-server processes, and highly restricted access by the registry database administrators. A full description of the database can be found in response to Question 33. Figure 24-1 depicts the overall SRS architecture including network components.

Number of Servers
As depicted in the SRS architecture diagram above Neustar operates a high availability architecture where at each level of the stack there are no single points of failures. Each of the network level devices run with dual pairs as do the databases. For the .AMAZON registry, the SRS will operate with 8 protocol servers and 6 policy engine servers. These expand horizontally as volume increases due to additional TLDs, increased load, and through organic growth. In addition to the SRS servers described above, there are multiple backend servers for services such as DNS and WHOIS. These are discussed in detail within those respective response sections.

Description of Interconnectivity with Other Registry Systems
The core SRS service interfaces with other external systems via Neustar’s external systems layer. The services that the SRS interfaces with include:

- WHOIS
- DNS
- Billing
- Data Warehouse (Reporting and Data Escrow).

Other external interfaces may be deployed to meet the unique needs of a TLD. At this time there are no additional interfaces planned for .AMAZON.

The SRS includes an “external notifier” concept in its business policy engine as a message dispatcher. This design allows time-consuming backend processing to be decoupled from critical online registrar transactions. Using an external notifier solution, the registry can utilize “control levers” that allow it to tune or to disable processes to ensure optimal performance at all times. For example, during the early minutes of a TLD launch, when unusually high volumes of transactions are expected, the registry can elect to suspend processing of one or more back end systems in order to ensure that greater processing power is available to handle the increased load requirements. This proven architecture has been used with numerous TLD launches, some of which have involved the processing of over tens of millions of transactions in the opening hours. The following are the standard three external notifiers used the SRS:

WHOIS External Notifier
The WHOIS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on WHOIS. It is important to note that, while the WHOIS external notifier feeds the WHOIS system, it intentionally does not have visibility into the actual contents of the WHOIS system. The WHOIS external notifier serves just as a tool to send a signal to the WHOIS system that a change is ready to occur. The WHOIS system possesses the intelligence and data visibility to know exactly what needs to change in WHOIS. See response to Question 26 for greater detail.

DNS External Notifier
The DNS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on DNS. Like the WHOIS external notifier, the DNS external notifier does not have visibility into the actual contents of the DNS zones. The work items that are generated by the notifier indicate to the dynamic DNS update sub-system that a change occurred that may impact DNS. That DNS system
has the ability to decide what actual changes must be propagated out to the DNS constellation. See response to Question 35 for greater detail.

Billing External Notifier
The billing external notifier is responsible for sending all billable transactions to the downstream financial systems for billing and collection. This external notifier contains the necessary logic to determine what types of transactions are billable. The financial systems use this information to apply appropriate debits and credits based on registrar.

Data Warehouse
The data warehouse is responsible for managing reporting services, including registrar reports, business intelligence dashboards, and the processing of data escrow files. The Reporting Database is used to create both internal and external reports, primarily to support registrar billing and contractual reporting requirement. The data warehouse databases are updated on a daily basis with full copies of the production SRS data.

Frequency of Synchronization between Servers
The external notifiers discussed above perform updates in near real-time, well within the prescribed service level requirements. As transactions from registrars update the core SRS, update notifications are pushed to the external systems such as DNS and WHOIS. These updates are typically live in the external system within 2-3 minutes.

Synchronization Scheme (e.g., hot standby, cold standby)
Neustar operates two hot databases within the data center that is operating in primary mode. These two databases are kept in sync via synchronous replication. Additionally, there are two databases in the secondary data center. These databases are updated real time through asynchronous replication. This model allows for high performance while also ensuring protection of data. See response to Question 33 for greater detail.

Compliance with Specification 6 Section 1.2
The SRS implementation for .AMAZON is fully compliant with Specification 6, including section 1.2. EPP Standards are described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. Extensible Provisioning Protocol or EPP is defined by a core set of RFCs that standardize the interface that make up the registry-registrar model. The SRS interface supports EPP 1.0 as defined in the following RFCs shown in Table 24-1.

Additional information on the EPP implementation and compliance with RFCs can be found in the response to Question 25.

Compliance with Specification 10
Specification 10 of the New TLD Agreement defines the performance specifications of the TLD, including service level requirements related to DNS, RDDS (WHOIS), and EPP. The requirements include both availability and transaction response time measurements. As an experienced registry operator, Neustar has a long and verifiable track record of providing registry services that consistently exceed the performance specifications stipulated in ICANN agreements. This same high level of service will be provided for the .AMAZON Registry. The following section describes Neustar’s experience and its capabilities to meet the requirements in the new agreement.

To properly measure the technical performance and progress of TLDs, Neustar collects data on key essential operating metrics. These measurements are key indicators of the performance and health of the registry. Neustar’s current .biz SLA commitments are among the most stringent in the industry today, and exceed the requirements for new TLDs. Table 24-2 compares the current SRS performance levels compared to the requirements for new TLDs, and clearly demonstrates the ability of the SRS to exceed those requirements.

Their ability to commit and meet such high performance standards is a direct result of their philosophy towards operational excellence. See response to Question 31 for a full description of their philosophy for building and managing for performance.

24.3 Resourcing Plans
The development, customization, and on-going support of the SRS are the
responsibility of a combination of technical and operational teams, including:
- Development/Engineering
- Database Administration
- Systems Administration
- Network Engineering.

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will be involved in the design and testing. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably.

The necessary resources will be pulled from the pool of operational resources described in detail in the response to Question 31. Neustar’s SRS implementation is very mature, and has been in production for over 10 years. As such, very little new development related to the SRS will be required for the implementation of the .AMAZON registry. The following resources are available from those teams:
- Development/Engineering - 19 employees
- Database Administration - 10 employees
- Systems Administration - 24 employees
- Network Engineering - 5 employees

The resources are more than adequate to support the SRS needs of all the TLDs operated by Neustar, including the .AMAZON registry.

25. Extensible Provisioning Protocol (EPP)

25.1 Introduction
Amazon EU S.à r.l.’s back-end registry operator, Neustar, has over 10 years of experience operating EPP based registries. They deployed one of the first EPP registries in 2001 with the launch of .biz. In 2004, they were the first gTLD to implement EPP 1.0. Over the last ten years Neustar has implemented numerous extensions to meet various unique TLD requirements. Neustar will leverage its extensive experience to ensure Amazon EU S.à r.l. is provided with an unparalleled EPP based registry. The following discussion explains the EPP interface which will be used for the .AMAZON registry. This interface exists within the protocol farm layer as described in Question 24 and is depicted in Figure 25-1.

25.2 EPP Interface
Registrars are provided with two different interfaces for interacting with the registry. Both are EPP based, and both contain all the functionality necessary to provision and manage domain names. The primary mechanism is an EPP interface to connect directly with the registry. This is the interface registrars will use for most of their interactions with the registry. However, an alternative web GUI (Registry Administration Tool) that can also be used to perform EPP transactions will be provided. The primary use of the Registry Administration Tool is for performing administrative or customer support tasks.

The main features of the EPP implementation are:
- Standards Compliance: The EPP XML interface is compliant to the EPP RFCs.
- Scalability: The system is deployed keeping in mind that it may be required to grow and shrink the footprint of the Registry system for a particular TLD.
- Fault-tolerance: The EPP servers are deployed in two geographically separate data centers to provide for quick failover capability in case of a major outage in a particular data center. The EPP servers adhere to strict availability requirements defined in the SLAs.
- Configurability: The EPP extensions are built in a way that they can be easily configured to turn on or off for a particular TLD.
- Extensibility: The software is built ground up using object oriented design. This allows for easy extensibility of the software without risking the possibility of the change rippling through the whole application.
- Auditable: The system stores detailed information about EPP transactions.
from provisioning to DNS and WHOIS publishing. In case of a dispute regarding a name registration, the Registry can provide comprehensive audit information on EPP transactions.

Security: The system provides IP address based access control, client credential-based authorization test, digital certificate exchange, and connection limiting to the protocol layer.

25.3 Compliance with RFCs and Specifications
The registry-registrar model is described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. As shown in Table 25-1, EPP is defined by the core set of RFCs that standardize the interface that registrars use to provision domains with the SRS. As a core component of the SRS architecture, the implementation is fully compliant with all EPP RFCs.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to EPP. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

Neustar has a long history of providing exceptional service that exceeds all performance specifications. The SRS and EPP interface have been designed to exceed the EPP specifications defined in Specification 10 of the Registry Agreement and profiled in Table 25-2. Evidence of Neustar’s ability to perform at these levels can be found in the .biz monthly progress reports found on the ICANN website.

EPP Toolkits
Toolkits, under open source licensing, are freely provided to registrars for interfacing with the SRS. Both Java and C++ toolkits will be provided, along with the accompanying documentation. The Registrar Tool Kit (RTK) is a software development kit (SDK) that supports the development of a registrar software system for registering domain names in the registry using EPP. The SDK consists of software and documentation as described below.

The software consists of working Java and C++ EPP common APIs and samples that implement the EPP core functions and EPP extensions used to communicate between the registry and registrar. The RTK illustrates how XML requests (registration events) can be assembled and forwarded to the registry for processing. The software provides the registrar with the basis for a reference implementation that conforms to the EPP registry-registrar protocol. The software component of the SDK also includes XML schema definition files for all Registry EPP objects and EPP object extensions. The RTK also includes a “dummy” server to aid in the testing of EPP clients. The accompanying documentation describes the EPP software package hierarchy, the object data model, and the defined objects and methods (including calling parameter lists and expected response behavior). New versions of the RTK are made available from time to time to provide support for additional features as they become available and support for other platforms and languages.

25.4 Proprietary EPP Extensions
The .AMAZON registry will not include proprietary EPP extensions. Neustar has implemented various EPP extensions for both internal and external use in other TLD registries. These extensions use the standard EPP extension framework described in RFC 5730. Table 25-3 provides a list of extensions developed for other TLDs. Should the .AMAZON registry require an EPP extension at some point in the future, the extension will be implemented in compliance with all RFC specifications including RFC 3735.

The full EPP schema to be used in the .AMAZON registry is attached in the document.
titled "EPP Schema."

25.5 Resourcing Plans

The development and support of EPP is largely the responsibility of the Development/Engineering and Quality Assurance teams. As an experience registry operator with a fully developed EPP solution, on-going support is largely limited to periodic updates to the standard and the implementation of TLD specific extensions. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Development/Engineering – 19 employees
Quality Assurance – 7 employees.
These resources are more than adequate to support any EPP modification needs of the .AMAZON registry.

26. Whois

26.1 Introduction
Amazon EU S.à r.l. recognizes the importance of an accurate, reliable, and up-to-date WHOIS database to governments, law enforcement, intellectual property holders and the public as a whole and is firmly committed to complying with all of the applicable WHOIS specifications for data objects, bulk access, and lookups as defined in Specifications 4 and 10 to the Registry Agreement. Amazon EU S.à r.l.’s back-end registry services provider, Neustar, has extensive experience providing ICANN and RFC-compliant WHOIS services for each of the TLDs that it operates both as a Registry Operator for gTLDs, ccTLDs and back-end registry services provider. As one of the first "thick" registry operators in the gTLD space, Neustar’s WHOIS service has been designed from the ground up to display as much information as required by a TLD and respond to a very stringent availability and performance requirement.

Some of the key features of .AMAZON’s solution include:
- Fully compliant with all relevant RFCs including 3912
- Production proven, highly flexible, and scalable with a track record of 100% availability over the past 10 years
- Exceeds current and proposed performance specifications
- Supports dynamic updates with the capability of doing bulk updates
- Geographically distributed sites to provide greater stability and performance

In addition, .AMAZON’s thick-WHOIS solution also provides for additional search capabilities and mechanisms to mitigate potential forms of abuse as discussed below. (e.g., IDN, registrant data).

26.2 Software Components
The WHOIS architecture comprises the following components:
- An in-memory database local to each WHOIS node: To provide for the performance needs, the WHOIS data is served from an in-memory database indexed by searchable keys.
- Redundant servers: To provide for redundancy, the WHOIS updates are propagated to a cluster of WHOIS servers that maintain an independent copy of the database.
- Attack resistant: To ensure that the WHOIS system cannot be abused using malicious queries or DOS attacks, the WHOIS server is only allowed to query the local database and rate limits on queries based on IPs and IP ranges can be readily applied.
- Accuracy auditor: To ensure the accuracy of the information served by the WHOIS servers, a daily audit is done between the SRS information and the WHOIS responses for the domain names which are updated during the last 24-hour period. Any discrepancies are resolved proactively.
- Modular design: The WHOIS system allows for filtering and translation of
data elements between the SRS and the WHOIS database to allow for customizations.

Scalable architecture: The WHOIS system is scalable and has a very small footprint. Depending on the query volume, the deployment size can grow and shrink quickly.

Flexible: It is flexible enough to accommodate thin, thick, or modified thick models and can accommodate any future ICANN policy, such as different information display levels based on user categorization.

SRS master database: The SRS database is the main persistent store of the Registry information. The Update Agent computes what WHOIS updates need to be pushed out. A publish-subscribe mechanism then takes these incremental updates and pushes to all the WHOIS slaves that answer queries.

26.3 Compliance with RFC and Specifications 4 and 10
Neustar has been running thick-WHOIS Services for over 10+ years in full compliance with RFC 3912 and with Specifications 4 and 10 of the Registry Agreement. RFC 3912 is a simple text based protocol over TCP that describes the interaction between the server and client on port 43. Neustar built a home-grown solution for this service. It processes millions of WHOIS queries per day.

Table 26-1 describes Neustar’s compliance with Specifications 4 and 10.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to WHOIS. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

26.4 High-level WHOIS System Description

26.4.1 WHOIS Service (port 43)
The WHOIS service is responsible for handling port 43 queries. Our WHOIS is optimized for speed using an in-memory database and master-slave architecture between the SRS and WHOIS slaves.

The WHOIS service also has built-in support for IDN. If the domain name being queried is an IDN, the returned results include the language of the domain name, the domain name’s UTF-8 encoded representation along with the Unicode code page.

26.4.2 Web Page for WHOIS queries
In addition to the WHOIS Service on port 43, Neustar provides a web based WHOIS application (www.whois.AMAZON). It is an intuitive and easy to use application for the general public to use. WHOIS web application provides all of the features available in the port 43 WHOIS. This includes full and partial search on:

- Domain names
- Nameservers
- Registrant, Technical and Administrative Contacts
- Registrars

It also provides features not available on the port 43 service. These include:

1. Redemption Grace Period calculation: Based on the registry’s policy, domains in pendingDelete can be restorable or scheduled for release depending on the date/time the domain went into pendingDelete. For these domains, the web based WHOIS displays "Restorable" or "Scheduled for Release" to clearly show this additional status to the user.

2. Extensive support for international domain names (IDN)
3. Ability to perform WHOIS lookups on the actual Unicode IDN
4. Display of the actual Unicode IDN in addition to the ACE-encoded name
5. A Unicode to Punycode and Punycode to Unicode translator
6. An extensive FAQ
7. A list of upcoming domain deletions

26.5 IT and Infrastructure Resources
As described above the WHOIS architecture uses a workflow that decouples the update process from the SRS. This ensures SRS performance is not adversely affected by the load requirements of dynamic updates. It is also decoupled from the WHOIS lookup agent to ensure the WHOIS service is always available and performing well for users.
Each of Neustar’s geographically diverse WHOIS sites use:

- Firewalls, to protect this sensitive data
- Dedicated servers for MQ Series, to ensure guaranteed delivery of WHOIS updates
- Packetshaper for source IP address-based bandwidth limiting
- Load balancers to distribute query load
- Multiple WHOIS servers for maximizing the performance of WHOIS service.

The WHOIS service uses HP BL 460C servers, each with 2 X Quad Core CPU and a 64GB of RAM. The existing infrastructure has 6 servers, but is designed to be easily scaled with additional servers should it be needed.

Figure 26-1 depicts the different components of the WHOIS architecture.

26.6 Interconnectivity with Other Registry System

As described in Question 24 about the SRS and further in response to Question 31, “Technical Overview”, when an update is made by a registrar that impacts WHOIS data, a trigger is sent to the WHOIS system by the external notifier layer. The update agent processes these updates, transforms the data if necessary and then uses messaging oriented middleware to publish all updates to each WHOIS slave. The local update agent accepts the update and applies it to the local in-memory database. A separate auditor compares the data in WHOIS and the SRS daily and monthly to ensure accuracy of the published data.

26.7 Frequency of Synchronization between Servers

Updates from the SRS, through the external notifiers, to the constellation of independent WHOIS slaves happens in real-time via an asynchronous publish/subscribe messaging architecture. The updates are guaranteed to be updated in each slave within the required SLA of 95% ≤ 60 minutes. Please note that Neustar’s current architecture is built towards the stricter SLAs (95% ≤ 15 minutes) of .BIZ. The vast majority of updates tend to happen within 2-3 minutes.

26.8 Provision for Searchable WHOIS Capabilities

Neustar will create a new web-based service to address the new search features based on requirements specified in Specification 4 Section 1.8. The application will enable users to search the WHOIS directory using any one or more of the following fields:

- Domain name
- Registrar ID
- Contacts and registrant’s name
- Contact and registrant’s postal address, including all the sub-fields described in EPP (e.g., street, city, state or province, etc.)
- Name server name and name server IP address

The system will also allow search using non-Latin character sets which are compliant with IDNA specification.

The user will choose one or more search criteria, combine them by Boolean operators (AND, OR, NOT) and provide partial or exact match regular expressions for each of the criterion name-value pairs. The domain names matching the search criteria will be returned to the user.

Figure 26-2 shows an architectural depiction of the new service.

Potential Forms of Abuse

As recognized by the Terms of Reference for Whois Misuse Studies, http://gnso.icann.org/issues/whois-to-whois-misuse-studies-25sep09-en.pdf, a number of reported and recorded harmful acts, such as spam, phishing, identity theft, and stalking which Registrants believe were sent using WHOIS contact information.

Although these Whois studies are still underway, there is a general belief that public access to Whois data may lead to a measurable degree of misuse - that is, to actions that cause actual harm, are illegal or illegitimate, or otherwise contrary to the stated legitimate purpose. One of the other key focuses of these studies will be to correlate the reported incidents of harmful acts with anti-harvesting measures that some Registrars and Registries apply to WHOIS queries (e.g., rate limiting, CAPTCHA, etc.).
Neustar firmly believes that adding the increased search capabilities, without appropriate controls could exacerbate the potential abuses associated with the Whois service. To mitigate the risk of this powerful search service being abused by unscrupulous data miners, a layer of security will be built around the query engine which will allow the registry to identify rogue activities and then take appropriate measures. Potential abuses include, but are not limited to:

- Data Mining
- Unauthorized Access
- Excessive Querying
- Denial of Service Attacks

To mitigate the abuses noted above, Neustar will implement any or all of these mechanisms as appropriate:

- Username-password based authentication
- Certificate based authentication
- Data encryption
- CAPTCHA mechanism to prevent robo invocation of Web query
- Fee-based advanced query capabilities for premium customers.

The searchable WHOIS application will adhere to all privacy laws and policies of the .AMAZON registry.

26.9 Resourcing Plans

As with the SRS, the development, customization, and on-going support of the WHOIS service is the responsibility of a combination of technical and operational teams. The primary groups responsible for managing the service include:

- Development/Engineering – 19 employees
- Database Administration – 10 employees
- Systems Administration – 24 employees
- Network Engineering – 5 employees

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will also be involved. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31.

Neustar’s WHOIS implementation is very mature, and has been in production for over 10 years. As such, very little new development will be required to support the implementation of the .AMAZON registry. The resources are more than adequate to support the WHOIS needs of all the TLDs operated by Neustar, including the .AMAZON registry.

27. Registration Life Cycle

27.1 Registration Life Cycle

Introduction

.AMAZON will follow the lifecycle and business rules found in the majority of gTLDs today. Our back-end operator, Neustar, has over ten years of experience managing numerous TLDs that utilize standard and unique business rules and lifecycles. This section describes the business rules, registration states, and the overall domain lifecycle that will be used for .AMAZON.

Domain Lifecycle – Description

The registry will use the EPP 1.0 standard for provisioning domain names, contacts and hosts. Each domain record is comprised of three registry object types: domain, contacts, and hosts.

Domains, contacts and hosts may be assigned various EPP defined statuses indicating either a particular state or restriction placed on the object. Some statuses may be applied by the Registrar; other statuses may only be applied by the Registry. Statuses are an integral part of the domain lifecycle and serve the dual purpose of indicating the particular state of the domain and indicating any restrictions placed on the domain. The EPP standard defines 17 statuses, however only 14 of these statuses will be used in the .AMAZON registry per the defined .AMAZON business rules.
The following is a brief description of each of the statuses. Server statuses may only be applied by the Registry, and client statuses may be applied by the Registrar.

OK – Default status applied by the Registry.
Inactive – Default status applied by the Registry if the domain has less than 2 nameservers.
PendingCreate – Status applied by the Registry upon processing a successful Create command, and indicates further action is pending. This status will not be used in the .AMAZON registry.
PendingTransfer – Status applied by the Registry upon processing a successful Transfer request command, and indicates further action is pending.
PendingDelete – Status applied by the Registry upon processing a successful Delete command that does not result in the immediate deletion of the domain, and indicates further action is pending.
PendingRenew – Status applied by the Registry upon processing a successful Renew command that does not result in the immediate renewal of the domain, and indicates further action is pending. This status will not be used in the .AMAZON registry.
PendingUpdate – Status applied by the Registry if an additional action is expected to complete the update, and indicates further action is pending. This status will not be used in the .AMAZON registry.
Hold – Removes the domain from the DNS zone.
UpdateProhibited – Prevents the object from being modified by an Update command.
TransferProhibited – Prevents the object from being transferred to another Registrar by the Transfer command.
RenewProhibited – Prevents a domain from being renewed by a Renew command.
DeleteProhibited – Prevents the object from being deleted by a Delete command.

The lifecycle of a domain begins with the registration of the domain. All registrations must follow the EPP standard, as well as the specific business rules described in the response to Question 18 above. Upon registration a domain will either be in an active or inactive state. Domains in an active state are delegated and have their delegation information published to the zone. Inactive domains either have no delegation information or their delegation information is not published in the zone. Following the initial registration of a domain, one of five actions may occur during its lifecycle:

Domain may be updated
Domain may be deleted, either within or after the add-grace period
Domain may be renewed at anytime during the term
Domain may be auto-renewed by the Registry
Domain may be transferred to another registrar.

Each of these actions may result in a change in domain state. This is described in more detail in the following section. Every domain must eventually be renewed, auto-renewed, transferred, or deleted. A registrar may apply EPP statuses described above to prevent specific actions such as updates, renewals, transfers, or deletions.

27.1.1 Registration States
Domain Lifecycle – Registration States
As described above the .AMAZON registry will implement a standard domain lifecycle found in most gTLD registries today. There are five possible domain states:

Active
Inactive
Locked
Pending Transfer
Pending Delete.

All domains are always in either an Active or Inactive state, and throughout the course of the lifecycle may also be in a Locked, Pending Transfer, and Pending Delete state. Specific conditions such as applied EPP policies and registry business rules will determine whether a domain can be transitioned between states.
Additionally, within each state, domains may be subject to various timed events such as grace periods, and notification periods.

Active State
The active state is the normal state of a domain and indicates that delegation data has been provided and the delegation information is published in the zone. A domain in an Active state may also be in the Locked or Pending Transfer states.

Inactive State
The Inactive state indicates that a domain has not been delegated or that the delegation data has not been published to the zone. A domain in an Inactive state may also be in the Locked or Pending Transfer states. By default all domain in the Pending Delete state are also in the Inactive state.

Locked State
The Locked state indicates that certain specified EPP transactions may not be performed to the domain. A domain is considered to be in a Locked state if at least one restriction has been placed on the domain; however up to eight restrictions may be applied simultaneously. Domains in the Locked state will also be in the Active or Inactive, and under certain conditions may also be in the Pending Transfer or Pending Delete states.

Pending Transfer State
The Pending Transfer state indicates a condition in which there has been a request to transfer the domain from one registrar to another. The domain is placed in the Pending Transfer state for a period of time to allow the current (losing) registrar to approve (ack) or reject (nack) the transfer request. Registrars may only nack requests for reasons specified in the Inter-Registrar Transfer Policy.

Pending Delete State
The Pending Delete State occurs when a Delete command has been sent to the Registry after the first 5 days (120 hours) of registration. The Pending Delete period is 35-days during which the first 30-days the name enters the Redemption Grace Period (RGP) and the last 5-days guarantee that the domain will be purged from the Registry Database and available to public pool for registration on a first come, first serve basis.

27.1.2 Typical Registration Lifecycle Activities

Domain Creation Process
The creation (registration) of domain names is the fundamental registry operation. All other operations are designed to support or compliment a domain creation. The following steps occur when a domain is created.

1. Contact objects are created in the SRS database. The same contact object may be used for each contact type, or they may all be different. If the contacts already exist in the database this step may be skipped.
2. Nameservers are created in the SRS database. Nameservers are not required to complete the registration process; however any domain with less than 2 nameservers will not be resolvable.
3. The domain is created using the each of the objects created in the previous steps. In addition, the term and any client statuses may be assigned at the time of creation.

The actual number of EPP transactions needed to complete the registration of a domain name can be as few as one and as many as 40. The latter assumes seven distinct contacts and 13 nameservers, with Check and Create commands submitted for each object.

Update Process
Registry objects may be updated (modified) using the EPP Modify operation. The Update transaction updates the attributes of the object. For example, the Update operation on a domain name will only allow the following attributes to be updated:

- Domain statuses
- Registrant ID
- Administrative Contact ID
- Billing Contact ID
- Technical Contact ID
- Nameservers
- AuthInfo
- Additional Registrar provided fields.
The Update operation will not modify the details of the contacts. Rather it may be used to associate a different contact object (using the Contact ID) to the domain name. To update the details of the contact object the Update transaction must be applied to the contact itself. For example, if an existing registrant wished to update the postal address, the Registrar would use the Update command to modify the contact object, and not the domain object.

Renew Process

The term of a domain may be extended using the EPP Renew operation. ICANN policy general establishes the maximum term of a domain name to be 10 years, and Neustar recommends not deviating from this policy. A domain may be renewed-extended at any point time, even immediately following the initial registration. The only stipulation is that the overall term of the domain name may not exceed 10 years. If a Renew operation is performed with a term value will extend the domain beyond the 10 year limit, the Registry will reject the transaction entirely.

Transfer Process

The EPP Transfer command is used for several domain transfer related operations:Initiate a domain transfer
  Cancel a domain transfer
  Approve a domain transfer
  Reject a domain transfer.

To transfer a domain from one Registrar to another the following process is followed:
4. The gaining (new) Registrar submits a Transfer command, which includes the AuthInfo code of the domain name.
5. If the AuthInfo code is valid and the domain is not in a status that does not allow transfers the domain is placed into pendingTransfer status.
6. A poll message notifying the losing Registrar of the pending transfer is sent to the Registrar’s message queue.
7. The domain remains in pendingTransfer status for up to 120 hours, or until the losing (current) Registrar Acks (approves) or Nack (rejects) the transfer request.
8. If the losing Registrar has not Acked or Nacked the transfer request within the 120 hour timeframe, the Registry auto-approves the transfer.
9. The requesting Registrar may cancel the original request up until the transfer has been completed.

A transfer adds an additional year to the term of the domain. In the event that a transfer will cause the domain to exceed the 10 year maximum term, the Registry will add a partial term up to the 10 year limit. Unlike with the Renew operation, the Registry will not reject a transfer operation.

Deletion Process

A domain may be deleted from the SRS using the EPP Delete operation. The Delete operation will result in either the domain being immediately removed from the database or the domain being placed in pendingDelete status. The outcome is dependent on when the domain is deleted. If the domain is deleted within the first five days (120 hours) of registration, the domain is immediately removed from the database. A deletion at any other time will result in the domain being placed in pendingDelete status and entering the Redemption Grace Period (RGP). Additionally, domains that are deleted within five days (120) hours of any billable (add, renew, transfer) transaction may be deleted for credit.

Grace Periods

There are six grace periods:
  Add-Delete Grace Period (AGP)
  Renew-Delete Grace Period
  Transfer-Delete Grace Period
  Auto-Renew-Delete Grace Period
  Auto-Renew Grace Period
  Redemption Grace Period (RGP).

The first four grace periods listed above are designed to provide the Registrar with the ability to cancel a revenue transaction (add, renew, or transfer) within a
certain period of time and receive a credit for the original transaction. The following describes each of these grace periods in detail.

Add-Delete Grace Period
The APG is associated with the date the Domain was registered. Domains may be deleted for credit during the initial 120 hours of a registration, and the Registrar will receive a billing credit for the original registration. If the domain is deleted during the Add Grace Period, the domain is dropped from the database immediately and a credit is applied to the Registrar’s billing account.

Renew-Delete Grace Period
The Renew-Delete Grace Period is associated with the date the Domain was renewed. Domains may be deleted for credit during the 120 hours after a renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly renewed. It should be noted that domains that are deleted during the renew grace period will be placed into pendingDelete and will enter the RGP (see below).

Transfer-Delete Grace Period
The Transfer-Delete Grace Period is associated with the date the Domain was transferred to another Registrar. Domains may be deleted for credit during the 120 hours after a transfer. It should be noted that domains that are deleted during the renew grace period will be placed into pendingDelete and will enter the RGP. A deletion of domain after a transfer is not the method used to correct a transfer mistake. Domains that have been erroneously transferred or hijacked by another party can be transferred back to the original registrar through various means including contacting the Registry.

Auto-Renew-Delete Grace Period
The Auto-Renew-Delete Grace Period is associated with the date the Domain was auto-renewed. Domains may be deleted for credit during the 120 hours after an auto-renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly auto-renewed. It should be noted that domains that are deleted during the auto-renew delete grace period will be placed into pendingDelete and will enter the RGP.

Auto-Renew Grace Period
The Auto-Renew Grace Period is a special grace period intended to provide registrants with an extra amount of time, beyond the expiration date, to renew their domain name. The grace period lasts for 45 days from the expiration date of the domain name. Registrars are not required to provide registrants with the full 45 days of the period.

Redemption Grace Period
The RGP is a special grace period that enables Registrars to restore domains that have been inadvertently deleted but are still in pendingDelete status within the Redemption Grace Period. All domains enter the RGP except those deleted during the AGP.

The RGP period is 30 days, during which time the domain may be restored using the EPP RenewDomain command as described below. Following the 30day RGP period the domain will remain in pendingDelete status for an additional five days, during which time the domain may NOT be restored. The domain is released from the SRS, at the end of the 5 day non-restore period. A restore fee applies and is detailed in the Billing Section. A renewal fee will be automatically applied for any domain past expiration.

Neustar has created a unique restoration process that uses the EPP Renew transaction to restore the domain and fulfill all the reporting obligations required under ICANN policy. The following describes the restoration process.

27.2 State Diagram
Figure 27-1 provides a description of the registration lifecycle.

The different states of the lifecycle are active, inactive, locked, pending transfer, and pending delete. Please refer to section 27.1.1 for detail description of each of these states. The lines between the states represent triggers that transition a domain from one state to another.

The details of each trigger are described below:
Create: Registry receives a create domain EPP command.
WithNS: The domain has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
WithoutNS: The domain has not met the minimum number of nameservers required by registry policy. The domain will not be in the DNS zone.
Remove Nameservers: Domain’s nameserver(s) is removed as part of an update domain EPP command. The total nameserver is below the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
Add Nameservers: Nameserver(s) has been added to domain as part of an update domain EPP command. The total number of nameservers has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
Delete: Registry receives a delete domain EPP command.
DeleteWithinAddGrace: Domain deletion falls within the add grace period.
DeleteAfterGrace: Domain deletion does not fall within the add grace period.
Restore: Domain is restored. Domain goes back to its original state prior to the delete command.
Transfer: Transfer request EPP command is received.
Transfer Approve/Cancel/Reject: Transfer requested is approved or cancel or rejected.
TransferProhibited: The domain is in clientTransferProhibited and/or serverTransferProhibited status. This will cause the transfer request to fail. The domain goes back to its original state.
DeleteProhibited: The domain is in clientDeleteProhibited and/or serverDeleteProhibited status. This will cause the delete command to fail. The domain goes back to its original state.

Note: the locked state is not represented as a distinct state on the diagram as a domain may be in a locked state in combination with any of the other states: inactive, active, pending transfer, or pending delete.

27.2.1 EPP RFC Consistency
As described above, the domain lifecycle is determined by ICANN policy and the EPP RFCs. Neustar has been operating ICANN TLDs for the past 10 years consistent and compliant with all the ICANN policies and related EPP RFCs.

27.3 Resources
The registration lifecycle and associated business rules are largely determined by policy and business requirements; as such the Product Management and Policy teams will play a critical role in working with Amazon EU S.à r.l. to determine the precise rules that meet the requirements of the TLD. Implementation of the lifecycle rules will be the responsibility of Development/Engineering team, with testing performed by the Quality Assurance team. Neustar’s SRS implementation is very flexible and configurable, and in many case development is not required to support business rule changes.
The .AMAZON registry will be using standard lifecycle rules, and as such no customization is anticipated. However should modifications be required in the future, the necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Development/Engineering – 19 employees
Registry Product Management – 4 employees
These resources are more than adequate to support the development needs of all the TLDs operated by Neustar, including the .AMAZON registry.

28. Abuse Prevention and Mitigation

28.1 Abuse Prevention and Mitigation
Amazon EU S.à r.l. and its registry service provider, Neustar, recognize that preventing and mitigating abuse and malicious conduct in the .AMAZON registry is an important and significant responsibility. Amazon EU S.à r.l. will leverage Neustar’s extensive experience in establishing and implementing registration
policies to prevent and mitigate abusive and malicious domain activity within the proposed .AMAZON space.

.AMAZON will be a single entity registry, with all domains registered to Amazon for use in pursuit of Amazon’s business goals. There will be no re-sellers in .AMAZON and there will be no market in .AMAZON domains. Amazon will strictly control the use of .AMAZON domains. Opportunities for abusive and malicious domain activity in .AMAZON are therefore very restricted but we will nonetheless abide by our obligations to ICANN. A responsible domain name registry works towards the eradication of abusive domain name registrations and malicious activity, which may include conduct such as:

- Illegal or fraudulent actions
- Spam
- Phishing
- Pharming
- Distribution of malware
- Fast flux hosting
- Botnets
- Malicious hacking
- Distribution of child pornography
- Online sale or distribution of illegal pharmaceuticals.

By taking an active role in researching and monitoring abusive domain name registration and malicious conduct, Neustar has developed the ability to efficiently work with various law enforcement and security communities to mitigate fast flux DNS-using botnets.

Policies and Procedures to Minimize Abusive Registrations

A registry must have the policies, resources, personnel, and expertise in place to combat such abusive registration and malicious conduct. Neustar, Amazon EU S.à r.l.’s registry services provider, has played a leading role in preventing such abusive practices, and has developed and implemented a “domain takedown” policy. Amazon EU S.à r.l. also believes that combating abusive use of the DNS is important in protecting registrants.

Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution. Because removing a domain name from the zone will stop all activity associated with the domain name, including websites and e-mail, the decision to remove a domain name from the DNS must follow a documented process, culminating in a determination that the domain name to be removed poses a threat to the security and stability of the Internet or the registry. Amazon EU S.à r.l., via Neustar, has an extensive, defined, and documented process for taking the necessary action of removing a domain from the zone when its presence in the zone poses a threat to the security and stability of the infrastructure of the Internet or the registry.

Abuse Point of Contact

As required by the Registry Agreement, Amazon EU S.à r.l. will establish and publish on its website a single abuse point of contact responsible for addressing inquiries from law enforcement and the public related to malicious and abusive conduct. Amazon EU S.à r.l. will also provide such information to ICANN before delegating any domain names in .AMAZON. This information shall consist of, at a minimum, a valid e-mail address dedicated solely to the handling of malicious conduct complaints, and a telephone number and mailing address for the primary contact. Amazon EU S.à r.l. will ensure that this information is accurate and current, and that updates are provided to ICANN if and when changes are made. In addition, the registry services provider for .AMAZON, Neustar, shall continue to have an additional point of contact for requests from registrars related to abusive domain name practices.

28.2 Policies Regarding Abuse Complaints

Amazon EU S.à r.l. will adopt an Acceptable Use Policy that (i) clearly defines the types of activities that will not be permitted in .AMAZON; (ii) reserves Amazon EU S.à r.l.’s right to lock, cancel, transfer or otherwise suspend or take down domain names violating the Acceptable Use Policy; and (iii) identify the circumstances under which Amazon EU S.à r.l. may share information with law enforcement. Amazon EU
S.à r.l. will incorporate its .AMAZON Acceptable User Policy into its Registry-Registrar Agreement.

Under the .AMAZON Acceptable Use Policy, which is set forth below, Amazon EU S.à r.l. may lock down the domain name to prevent any changes to the domain name contact and nameserver information, place the domain name “on hold” rendering the domain name non-resolvable, transfer the domain name to another registrar and/or in cases in which the domain name is associated with an ongoing law enforcement investigation, Amazon EU S.à r.l. will coordinate with law enforcement to assist in the investigation as described in more detail below.

It is Amazon EU S.à r.l.’s intention that all .AMAZON domain names will be registered and used by it and its Affiliates and that only ICANN-accredited registrars that have signed a Registry-Registrar Agreement will be permitted to register .AMAZON domain names. Accordingly, the potential for abusive registrations and malicious conduct in the .AMAZON registry is expected to be limited. In the unlikely event that such abuse should occur, Amazon EU S.à r.l. will work with its registry services provider, Neustar, to implement the following policies and processes to prevent and mitigate such activities. Below is initial Acceptable Use Policy for the .AMAZON registry.

.AMAZON Acceptable Use Policy

This Acceptable Use Policy gives the .AMAZON registry the ability to quickly lock, cancel, transfer or take ownership of any .AMAZON domain name, either temporarily or permanently, if the domain name is being used in a manner that appears to threaten the stability, integrity or security of the .AMAZON registry, or any of its registrar partners— and/or that may put the safety and security of any registrant or user at risk. The process also allows the .AMAZON registry to take preventive measures to avoid any such criminal or security threats.

The Acceptable Use Policy may be triggered through a variety of channels, including, among other things, private complaint, public alert, government or enforcement agency outreach, and the on-going monitoring by the .AMAZON registry or its partners. In all cases, the .AMAZON registry or its designees will alert .AMAZON registry’s registrar partners about any identified threats and will work closely with them to bring offending sites into compliance.

The following are some (but not all) activities that may be subject to rapid domain compliance:

- Phishing: the attempt to acquire personally identifiable information by masquerading as a website other than .AMAZON’s own.
- Pharming: the redirection of Internet users to websites other than those the user intends to visit, usually through unauthorized changes to the Hosts file on a victim’s computer or DNS records in DNS servers.
- Dissemination of Malware: the intentional creation and distribution of “malicious” software designed to infiltrate a computer system without the owner’s consent, including, without limitation, computer viruses, worms, key loggers, and Trojans.
- Fast Flux Hosting: a technique used to shelter Phishing, Pharming and Malware sites and networks from detection and to frustrate methods employed to defend against such practices, whereby the IP address associated with fraudulent websites are changed rapidly so as to make the true location of the sites difficult to find.
- Botnetting: the development and use of a command, agent, motor, service, or software which is implemented: (1) to remotely control the computer or computer system of an Internet user without their knowledge or consent, (2) to generate direct denial of service (DDOS) attacks.
- Malicious Hacking: the attempt to gain unauthorized access (or exceed the level of authorized access) to a computer, information system, user account or profile, database, or security system.
- Child Pornography: the storage, publication, display and/or dissemination of pornographic materials depicting individuals under the age of majority in the relevant jurisdiction.

The .AMAZON registry reserves the right, in its sole discretion, to take any administrative and operational actions necessary, including the use of computer forensics and information security technological services, among other things, in
order to implement the Acceptable Use Policy. In addition, the .AMAZON registry reserves the right to deny, cancel or transfer any registration or transaction, or place any domain name(s) on registry lock, hold or similar status, that it deems necessary, in its discretion (1) to protect the integrity and stability of the registry; (2) to comply with any applicable laws, government rules or requirements, requests of law enforcement, or any dispute resolution process; (3) to avoid any liability, civil or criminal, on the part of the .AMAZON registry as well as its affiliates, subsidiaries, officers, directors, and employees; (4) per the terms of the registration agreement, or (5) to correct mistakes made by the .AMAZON registry or any Registrar in connection with a domain name registration. The .AMAZON registry also reserves the right to place upon registry lock, hold or similar status a domain name during resolution of a dispute.

Taking Action Against Abusive and/or Malicious Activity

The .AMAZON registry is committed to acting in a timely manner against those domain names associated with abuse or malicious conduct in violation of the Acceptable Use Policy. After a complaint is received from a trusted source or third-party, or detected by the .AMAZON registry, the registry will use commercially reasonable efforts to verify the information in the complaint. If that information can be verified to the best of the registry’s ability, the sponsoring registrar will be notified and have 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. If the registrar has not acted when the 12-hour period ends (i.e., is unresponsive to the request or refuses to take action), the .AMAZON registry will place the domain on “ServerHold”. (It is unlikely the registrar will not timely act because Amazon EU S.à r.l. intends to use a single, gateway registrar with which it has a contract reflecting these policies). ServerHold removes the domain name from the .AMAZON zone, but the domain name record still appears in the TLD WHOIS database so that the name and entities can be investigated by law enforcement should they desire to get involved.

Coordination with Law Enforcement

Amazon EU S.à r.l. will obtain assistance from Neustar to meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of the .AMAZON registry. The .AMAZON registry will respond to legitimate law enforcement inquiries promptly upon receiving the request.

The response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. for rapid resolution of the request. If the request involves any of the activities that can be validated by the registry and implicates activity covered by the .AMAZON Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .AMAZON Registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

Monitoring for Malicious Activity

Neustar, .AMAZON’s registry services provider, has developed and implemented an active “domain takedown” policy in which the registry itself takes down abusive domain names.

Neustar targets domain names verified to be abusive and removes them within 12 hours regardless of whether the domain name registrar cooperated. Neustar has determined that the benefit in removing such threats outweighs any potential damage to the registrar-registrant relationship. Amazon EU S.à r.l.’s restrictions on registration eligibility make it unlikely that any .AMAZON domains will be taken down. The .AMAZON registry rules are anticipated to exclude third parties beyond Amazon EU S.à r.l. and its Affiliates. Moreover, only registrars that contractually agree to cooperate in stemming abusive behaviors will be permitted to register .AMAZON domain names.

Neustar’s active prevention policies stem from the notion that registrants
in .AMAZON have a reasonable expectation that they control the data associated with their domains, especially its presence in the DNS zone. Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution that harms not only the domain name registrant, but also potentially millions of unsuspecting Internet users.

Rapid Takedown Process
Since implementing the program, Neustar has developed two basic variations of the process. The more common process variation is a lightweight process that is triggered by “typical” notices. The less common variation is the full process that is triggered by unusual notices, which generally allege that a domain name is being used to threaten the stability and security of the TLD, or is part of a real-time investigation by law enforcement or security researchers. In these cases, accelerated action by the registry is necessary. These processes are described below, though it is important to note that .AMAZON will be managed as a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s subsidiaries. Therefore, the potential for abusive registrations and other activities that have a negative impact on Internet users is minimal. In the unlikely event that such abuse should occur, Amazon with its registry operator, Neustar, will implement the following policies and processes to manage such activities.

Lightweight Process
In addition to having an active Information Security group that, on its own initiatives, seeks out abusive practices in the .AMAZON registry, Neustar is an active member in a number of security organizations that have the expertise and experience in receiving and investigating reports of abusive DNS practices, including but not limited to, the Anti-Phishing Working Group, Castle Cops, NSP-SEC, the Registration Infrastructure Safety Group and others. Each of these sources is a well-known security organization that has a reputation for preventing abuse and malicious conduct on the Internet. Aside from these organizations, Neustar also actively participates in privately run security associations that operate based on trust and anonymity, making it much easier to obtain information regarding abusive DNS activity.

Once a complaint is received from a trusted source or third-party, or detected by Neustar’s internal security group, information about the abusive practice is forwarded to an internal mail distribution list that includes members of Neustar’s operations, legal, support, engineering, and security teams for immediate response (“CERT Team”). Although the impacted URL is included in the notification e-mail, the CERT Team is trained not to investigate the URLs themselves because the URLs in question often have scripts, bugs, etc. that can compromise the individual’s own computer and the network safety. Rather, the investigation is conducted by CERT team members who can access the URLs in a laboratory environment to avoid compromising the Neustar network. The lab environment is designed specifically for these types of tests and is scrubbed on a regular basis to ensure that none of Neustar’s internal or external network elements are harmed in any fashion.

Once the complaint has been reviewed and the alleged abusive domain name activity is verified to the best of the ability of the CERT Team, the sponsoring registrar has 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone.

The .AMAZON Registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

Full Process
In the unlikely event with a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s subsidiaries, that Neustar receives a complaint that claims that a domain name is being used to threaten the stability and security of the .AMAZON registry, or is a part of a real-time investigation by law enforcement or security, Neustar follows a slightly different course of action. Upon initiation of this process, members of the CERT Team are paged and a
teleconference bridge is immediately opened up for the CERT Team to assess whether the activity warrants immediate action. If the CERT Team determines the incident is not an immediate threat to the security and the stability of critical Internet infrastructure, the CERT Team provides documentation to the Neustar Network Operations Center to clearly capture the rationale for the decision and either refers the incident to the Lightweight process set forth above or closes the incident.

However, if the CERT TEAM determines that there is a reasonable likelihood that the incident warrants immediate action, a determination is made to immediately remove the domain from the zone. As such, Customer Support will contact Amazon EU S.à r.l.’s registrar immediately to communicate that there is a domain involved in a security and stability issue. The registrar is provided only the domain name in question and the broadly stated type of incident. As .AMAZON is a Single Entity Registry using a single registrar whose work will be strictly controlled through a Service Level Agreement that includes the implementation of measures to prevent abusive registrations, the risk of evidence of abuse being compromised is minimized.

Coordination with Law Enforcement & Industry Groups

Neustar has a close working relationship with a number of law enforcement agencies, both in the United States and Internationally. For example, in the United States, Neustar is in constant communication with the Federal Bureau of Investigation, US CERT, Homeland Security, the Food and Drug Administration, and the National Center for Missing and Exploited Children.

Neustar also participates in a number of industry groups aimed at sharing information among key industry players about the abusive registration and use of domain names. These groups include the Anti-Phishing Working Group and the Registration Infrastructure Safety Group (where Neustar served for several years on the Board of Directors). Through these organizations and others, Neustar proactively shares information with other registries, registrars, ccTLDs, law enforcement, security professionals, etc. not only on abusive domain name registrations within its own TLDs, but also with respect to information uncovered with respect to domain names in other registries’ TLDs. Neustar has often found that rarely are abuses found only in the TLDs for which it manages, but also within other TLDs, such as .com and .info. Neustar routinely provides this information to the other registries so that the relevant registry can take the appropriate action.

With the assistance of Neustar as its registry services provider, Amazon EU S.à r.l. can meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of its .AMAZON registry. Amazon EU S.à r.l. and/or Neustar will respond to legitimate law enforcement inquiries promptly upon receiving the request. Such response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. and/or Neustar for rapid resolution of the request.

If the request involves any of the activities that can be validated by the registry and/or Neustar and implicates the type of activity set forth in the Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the activity further and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .AMAZON registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

28.3 Measures for Removal of Orphan Glue Records

As the Security and Stability Advisory Committee of ICANN (SSAC) rightly acknowledges, although orphaned glue records may be used for abusive or malicious purposes, the “dominant use of orphaned glue supports the correct and ordinary operation of the DNS.” See http://www.icann.org/en/committees/security/sac048.pdf.

While orphan glue often support correct and ordinary operation of the DNS, such glue records can be used maliciously to point to name servers that host domains used in illegal phishing, bot-nets, malware, and other abusive behaviors. Problems occur when the parent domain of the glue record is deleted but its children glue records still remain in DNS. Therefore, when the .AMAZON registry has written evidence of actual abuse of orphaned glue, the .AMAZON registry will act to remove those records
from the zone to mitigate such malicious conduct.

Neustar runs a daily audit of entries in its DNS systems and compares those with its provisioning system, which serves as an umbrella protection that items in the DNS zone are valid. Any DNS record that shows up in the DNS zone but not in the provisioning system is flagged for investigation and removed if necessary. This daily DNS audit prevents not only orphaned hosts but also other records that should not be in the zone.

In addition, if either Amazon EU S.à r.l. or Neustar becomes aware of actual abuse on orphaned glue after receiving written notification from a third party through its Abuse Contact or through its customer support, such glue records will be removed from the zone.

28.4 Measures to Promote WHOIS Accuracy

The .AMAZON registry will implement several measures to promote Whois accuracy. Whois service for Amazon EU S.à r.l. will operate as follows. The registry will keep all basic contact details for each domain name in a unique internal system, which facilitates access to the domain information. In addition, Amazon EU S.à r.l. will perform internal monitoring checks and procedures that will only allow accurate Whois information and remove outdated data.

28.4.1. Authentication of Registrant Information

Amazon EU S.à r.l. will guarantee the adequate authentication of registrant data, ensuring the highest levels of accuracy and diligence when dealing with Whois data. In doing so, Amazon EU S.à r.l.’s solid internal system will undertake, but not be limited to the following measures: running checks against Whois internal records and regular verification of all contact details and other relevant registrant information. The Amazon EU S.à r.l.’s registrar will also be charged with regularly checking Whois accuracy.

Amazon EU S.à r.l. will have a well-defined registration policy that will include a requirement that complete and accurate registrant details are provided by the requestor for a domain. These details will be validated by the Amazon EU S.à r.l. registrar who will have a contractual duty to comply with Amazon EU S.à r.l.’s registration policy. The full details of every domain requestor will be kept in Amazon EU S.à r.l.’s on-line registry management dashboard which can be accessed by Amazon EU S.à r.l.’s Domain Management Team at any time.

28.4.2. Regular Monitoring of Registration Data

Amazon EU S.à r.l. will comply with ICANN’s Whois requirements. Among other measures, Amazon EU S.à r.l. will regularly remind its internal personnel to comply with ICANN’s Whois information Policy through regularly checking Whois data against internal records, offering Whois accuracy services, evaluating claims of fraudulent Whois data, and cancelling domain name registrations with outdated Whois details.

28.4.3. Policies and Procedures ensuring compliance

Only Amazon EU S.à r.l. and its Affiliates will be permitted to register and use Amazon EU S.à r.l. domain names. Accordingly, the duties of the Amazon EU S.à r.l. registrar will be very limited and closely defined. Regardless, Amazon EU S.à r.l.’s Registry-Registrar Agreement will require Amazon EU S.à r.l.’s registrar to take steps necessary to ensure Whois data is complete and accurate and to implement the .AMAZON registration policies.

28.5 Resourcing Plans

Responsibility for abuse mitigation rests with a variety of functional groups at Neustar. The Neustar Abuse Monitoring team is primarily responsible for providing analysis and conducting investigations of reports of abuse. The Neustar Customer Service team also plays an important role in assisting with investigations, responding to customers, and notifying registrars of abusive domains. Finally, the Neustar Policy-Legal team is responsible for developing the relevant policies and procedures.

The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are
available from those teams:
Customer Support - 12 employees
Policy/Legal - Two employees

The resources are more than adequate to support the abuse mitigation procedures of the .AMAZON registry.

Furthermore, Amazon EU S.à r.l. dedicates significant financial and personnel resources to combating malicious and abusive behavior in the DNS and across the internet. Amazon EU S.à r.l. will extend these resources to designating the unique abuse point of contact, regularly monitoring potential abusive and malicious activities with support from dedicated technical staff, analyzing reported abuse and malicious activity, and acting to address such reported activity.

The designated abuse prevention staff within Neustar and Amazon EU S.à r.l. will be subject to regular evaluations, receive adequate training and work under expert supervision. The abuse prevention resources will comprise both internal staff and external abuse prevention experts who would give extra advice and support when necessary. This external staff includes experts in Amazon EU S.à r.l.’s registrar where one legal manager and four operational experts will be available to support Amazon EU S.à r.l.

Please note that in the above answer the terms “We”, “Our” and “Amazon” may refer to either the applicant Amazon EU S.à r.l. or Amazon.com Inc., the ultimate parent, or sometimes NeuStar, the registry services provider.

29. Rights Protection Mechanisms

29.1 Introduction

Amazon is applying for .AMAZON to provide a dedicated platform for stable and secure online communication and interaction. Amazon has several thousand registered intellectual property assets of all types including trademarks, designs, and domain names - we place the protection of our intellectual property as a high priority and we respect the intellectual property of others.

29.1.1 Rights protection in gTLD registry operation is a core objective of Amazon. We will closely manage this TLD by registering domains through a single registrar. Although Amazon and its subsidiaries will be the only eligible registrants, we will nonetheless require our registrar to work with us on a four-step registration process featuring: (i) Eligibility Confirmation; (ii) Naming Convention Check; (iii) Acceptable Use Review; and (iv) Registration. As stated in our answer to Question 18, all domains in our registry will remain the property of Amazon and will be provisioned to support the business goals of Amazon. Because all domains will be registered and maintained by Amazon (for use that complements our strategic business goals), we can ensure that all domains in our registries will carry accurate and up-to-date registration records.

We believe that the above registration process will ensure that abusive registrations are prevented, but we will continue to monitor ICANN policy developments, and update our procedures as required.

29.2 Core measures to prevent abusive registrations

To further prevent abusive registration or cybersquatting, we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated for new gTLD operators by ICANN:

- A 30 day Sunrise process
- A 60 day Trademark Claims process

Generally, these RPMs are targeted at abusive registrations undertaken by third parties. However, domains in our registry will be registered only to Amazon or its subsidiaries through a single registrar who will be contractually required to ensure that stated rules covering eligibility and use of a domain are adhered to through a validation process. As a result, abusive registrations should be prevented. In the very unlikely circumstances that a domain is registered and used in an improper way, we acknowledge that we will be the respondent in related proceedings.
and we undertake to co-operate fully with ICANN and other appropriate agencies to resolve any concerns.

29.2.1 Sunrise Eligibility
Our Sunrise Eligibility Requirements will clearly state that eligible applicants must be members of the Amazon group of companies and its subsidiaries. Furthermore, all domain names must be used to support the business goals of Amazon. Nonetheless, notice of our Sunrise will be provided to third party holders of validated trademarks in the Trademark Clearinghouse as required by ICANN. Our Sunrise Eligibility Requirements will be published on the website of our registry.

29.2.2 Sunrise Window
As required in the Applicant Guidebook in section 7.1, our Sunrise window will recognize "all word marks: (i) nationally or regionally registered and for which proof of use - which can be a declaration and a single specimen of current use - was submitted to, and validated by, the Trademark Clearinghouse; or (ii) that have been court-validated; or (iii) that are specifically protected by statute or treaty currently in effect and that was in effect on or before 26 June 2008”.

Our Sunrise window will last for 30 days. Applications received from an ICANN-accredited registrar will be accepted for registration if they are (i) supported by an entry in the Trademark Clearinghouse (TMCH) during our Sunrise window and (ii) satisfy our Sunrise Eligibility Requirements. Once registered, those domain names will have a one year term of registration. Any domain names registered will be managed by our registrar.

29.2.3 Sunrise Dispute Resolution Policy
We will devise and publish the rules for our Sunrise Dispute Resolution Policy (SDRP) on our registry website. Our SDRP will apply to all our registries and will allow any party to raise a challenge on the following four grounds as required in the Applicant Guidebook (6.2.4):

(i) At the time the challenged domain name was registered, the registrant did not hold a trademark registration of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty;
(ii) The domain name is not identical to the mark on which the registrant based its Sunrise registration;
(iii) The trademark registration on which the registrant based its Sunrise registration is not of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty;
(iv) The trademark registration on which the domain name registrant based its Sunrise registration did not issue on or before the effective date of the Registry Agreement and was not applied for on or before ICANN announced the applications received.

Complaints can be submitted through our registry website within 30 days following the closure of our Sunrise, and will be initially processed by our registrar. Our registrar will promptly report to us: (i) the challenger; (ii) the challenged domain name; (iii) the grounds upon which the complaint is based; and (iv) why the challenger believes the grounds are satisfied.

29.2.4 Trademark Claims Service
Our Trademark Claims Service (TMCS) will run for a 60 day period following the closure of our 30 day Sunrise. Our TMCS will be supported by the Trademark Clearinghouse and will provide a notice to third parties interested in filing a character string in our registry of a registered trademark right that matches the character string in the TMCH.

We will honour and recognize in our TMCS the following types of marks as defined in the Applicant Guidebook section 7.1: (i) nationally or regionally registered; (ii) court-validated; or (iii) specifically protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion.

Once received from the TMCH, with which our registry provider will interface, a claim will be initially processed by our registrar who will provide a report to us on the eligibility of the applicant.

29.2.5 Implementation and Resourcing Plans of core services to prevent abusive
registration

Our Sunrise and IP Claims service will be introduced with the following timetable:

Day One: Announcement of Registry Launch and publication of registry website with details of the Sunrise and Trademark Claim Service (“TMCS”)

Day 30: Sunrise opens for 30 days on a first-come, first served basis. Once registrations are approved, they will be entered into the Shared Registry System (SRS) and published in our Thick-Whois database.

Day 60-75: Registry Open, domains applied for in the Sunrise registered and TMCS begins for a minimum of 60 days

Day 120-135: TMCS ends; normal operations continue.

Our Implementation Team will comprise the following:

From Amazon: the Director of IP will lead a team of up to seven experts with experience of domain name management and on-line legal dispute resolution, with access to other teams in Amazon Legal if required.

From NeuStar, registry service provider to Amazon: A Customer Support team of 12, a Product Management Team of four and a Development / Engineering Team of 19 will be available as required to support the legal team, led by Jeff Neuman. This team has over 10 years’ experience with implementing registry launches including rights protection schemes such as the .biz Sunrise and IP Claims.

In addition, Amazon will be supported by its Registrar which will provide two legal specialists, four client managers and six operational staff. The operational staff will undertake the validation checks on registration requests.

The Implementation Team will create a formal Registry Launch plan by 1 October 2012. This plan will set out the exact process for the launch of each Amazon registry and will define responsibilities and budgets. The Registry website, which is budgeted for in the three year plans provided in our answers to Question 46, will be built by 1 December 2012 or within 30 days of pre-validation testing beginning, whichever is the sooner. It will feature Rules of Registration, Rules of Eligibility, Terms & Conditions of Registration, Acceptable Use Policies as well as the Rules of the Sunrise, the Rules of the Sunrise Dispute Resolution Policy and the Rules of the Trademark Claims Service.

Technical implementation between the registry and the Trademark Clearinghouse will be undertaken by the registry service provider as soon as practical after the Trademark Clearinghouse is operational and announces its integration process. As demonstrated in our answer to question 46, a budget has been set aside to pay fees charged by the Trademark Clearinghouse Operator for this integration.

The contract we have with our registrar (the RAA) will require that the registrar uses the TMCH, adheres to the Terms & Conditions of the TMCH and will prohibit the registrar from filing domains in our registries on its own behalf or utilizing any data from the TMCH except in the provision of its duties as our registrar.

When processing TMCS claims, our registrar will be required to use the specific form of notice provided by ICANN in the Applicant Guidebook.

We will also require our registrar to implement appropriate privacy policies reflecting local requirements. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.

29.3 Mechanisms to identify and address the abusive use of registered domain names on an ongoing basis

To prevent the abusive use of registered domain names on an ongoing basis we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated by ICANN:

• The Uniform Dispute Resolution Policy (UDRP) to address domain names that have been registered and used in bad faith in the TLD.
• The Uniform Rapid Suspension (URS) scheme which is a faster, more efficient alternative to the Uniform Dispute Resolution Policy to deal with clear-cut cases of cybersquatting.
• The Post Delegation Dispute Resolution Procedure (PDDRP).
• Implementation of a Thick WHOIS making it easier for rights holders to identify and locate infringing parties.

The UDRP and the URS are targeted at abusive registrations undertaken by third parties and the PDDRP at so called “Bad Actor” registries. As domains in our registry will be registered not to third parties but only to Amazon or its
subsidiaries through a single registrar which will be required through contract to ensure that the rules covering eligibility and use of a domain are adhered to, we believe that abusive registrations by third parties should be completely prevented. Abusive behaviour by representatives of Amazon or our subsidiaries will be prevented by our internal processes, for example the pre-registration validation checks and monitoring of use of our registrar.

We acknowledge that we are subject to the UDRP, the URS and the PDDRP and we will co-operate fully with ICANN and appropriate registries in the unlikely circumstances that complaints against us, as the registrant, are made.

29.3.1 The Uniform Dispute Resolution Policy (UDRP)

The UDRP is an out-of-court dispute resolution mechanism for trademark owners to resolve clear cases of bad faith, abusive registration and use of domain names. The UDRP applies by contract to all domain name registrations in gTLDs. Standing to file a UDRP complaint is limited to trademark owners who must demonstrate their rights. To prevail in a UDRP complaint, the complainant must further demonstrate that the domain name registrant has no rights or legitimate interests in the disputed domain name, and that the disputed domain name has been registered and is being used in bad faith. In the event of a successful claim, the infringing domain name registration is transferred to the complainant’s control.

Amazon or its subsidiaries will be the respondent in all UDRP complaints because we will be the only eligible registrants. Therefore we do not anticipate that there are any circumstances in which complainants can argue that we have “no rights or legitimate interests” in a domain in our registry so the possibility of good faith UDRP complaints should be minimized. In the unlikely circumstances that a complaint is made, we will respond in a timely fashion, reflecting our contractual responsibility to ICANN as a registry operator.

We will be applying for an exemption to Clause 1b of the Registry Operators Code of Conduct. This means that we will not be allowed to transfer domains to third parties as the only registrant will be Amazon or our subsidiaries. Therefore if a complaint against us is filed, the only possible remedy will be the cancellation of the domain instead of the transfer to the complainant.

Should a successful complaint be made we will therefore place the cancelled domain on a list that prevents it from being registered again.

29.3.2 The URS

The URS is intended to be a lighter, quicker complement to the UDRP. Like the UDRP, it is intended for clear-cut cases of trademark abuse. Under the URS, the only remedy which a panel may grant is the temporary suspension of a domain name for the duration of the registration period (which may be extended by the prevailing complainant for one year, at commercial rates). URS substantive criteria mirror those of the UDRP but with a higher burden of proof for complainants, and additional registrant defences. Once a determination is rendered, a losing registrant has several appeal possibilities from 30 days up to one year. Either party may file a de novo appeal within 14 days of a decision. There are penalties for filing “abusive complaints” which may result in a ban on future URS filings.

As with the description of our UDRP process above, Amazon or its subsidiaries will be the respondent in all URS complaints because we will be the only eligible registrants. Therefore we do not anticipate that there are any circumstances in which complainants can argue that we have “no legitimate right or interest to the domain name” and “that the domain name was registered and is being used in bad faith.” Notwithstanding this, should a complaint be made, we will respond in a timely fashion, reflecting our contractual responsibility to ICANN as a registry operator.

Should a successful complaint be made, we will suspend the domain name for the duration of the registration period.

We will co-operate with the URS panel providers and panelists as we will co-operate with UDRP panel providers and panelists. Being the only eligible registrant, we will not make changes to a domain in Locked Status or alter a registration record associated with a URS complaint as required in the Applicant Guidebook.

29.3.3 The Post-Delegation Dispute Resolution Procedure (PDDRP)

The PDDRP is an administrative option for trademark owners to file an objection
against a registry whose “affirmative conduct” in its operation or use of its gTLD is alleged to cause or materially contribute to trademark abuse. In this way, the PDDRP is intended to act as a higher-level enforcement tool to assist ICANN compliance activities, where rights holders may not be able to continue to turn solely to lower-level multijurisdictional enforcement options in a vastly expanded DNS.

The PDDRP involves a number of procedural layers, such as an administrative compliance review, appointment of a “threshold review panel”, an expert determination as to liability under the procedure (with implementation of any remedies at ICANN’s discretion), a possible de novo appeal and further appeal to arbitration under ICANN’s registry terms. The PDDRP requires specific bad faith conduct including profit from encouraging infringement in addition to “the typical registration fee.”

As set out in the Applicant Guidebook in the appendix summarising the PDDRP, the grounds for a complaint on a second level registration are that, “(a) there is a substantial pattern or practice of specific bad faith intent by the registry operator to profit from the sale of trademark infringing domain names; and (b) the registry operator’s bad faith intent to profit from the systematic registration of domain names within the gTLD that are identical or confusingly similar to the complainant’s mark, which (i) takes unfair advantage of the distinctive character or the reputation of the complainant's mark or (ii) impairs the distinctive character or the reputation of the complainant’s mark, or (iii) creates a likelihood of confusion with the complainant’s mark.”

Whilst we will co-operate with any complaints made under the PDDRP and we will abide by any determinations, we think it is highly improbable that any PDDRP complaints will succeed because the grounds set out above cannot be satisfied as domains in the registry will not be for sale and cannot be transferred to third parties.

29.3.4 Thick Whois

As required in Specification 4 of the Registry agreement, all Amazon registries will provide Thick Whois. A Thick WHOIS provides a centralized location of registrant information within the control of the registry (as opposed to thin Whois where the data is dispersed across registrars).

Thick Whois will provide rights owners and law enforcement with the ability to review the registration record easily.

We will place a requirement on our registrar to ensure that all registrations are filed with accurate Whois details and we will undertake reviews of Whois accuracy every three months to ensure that the integrity of data under our control is maintained.

Amazon will create and publish a Whois Query email address so that third parties can submit queries about any domains in our registry.

29.3.5 Implementation and Resourcing Plans for mechanisms to identify and address the abusive use of registered domain names on an ongoing basis

Our post-launch rights protection mechanisms will be in place from Day One of the launch of the registry. To ensure that we are compliant with our obligations as a registry operator, we will develop a section of our registry website to assist third parties involved in UDRP, URS and PDDRP complaints including third parties wishing to make a complaint, ICANN compliance staff and the providers of UDRP and URS panels. This will feature an email address for enquiries relating to disputes or seeking further information on specific domains. We will monitor this address for all of the following: Notice of Complaint, Notice of Default, URS Determination, UDRP Determination, Notice of Appeal and Appeal Panel Findings where appropriate.

As stated in our answer to Question 18, Amazon’s Intellectual Property group will be responsible for the development, maintenance and enforcement of the Domain Management Policy. This will include ensuring that the following implementation targets are met:

- Locking domains that are the subject of URS complaints within 24 hours of receipt of a URS complaint, and ensuring our registrar locks domains that are the subject of UDRP complaints within 24 hours of receipt of a UDRP complaint.
- Confirming the implementation of the lock to the relevant URS provider, and ensure our registrar confirms the implementation of the lock to the relevant UDRP provider.
• Ensuring that our registrar cancels domain names that are the subject of a successful UDRP complaint within 24 hours

• Redirecting servers to a website with the ICANN mandated information following a successful URS within 24 hours

The human resources dedicated to managing post-launch RPM include:

From Amazon: the Director of IP will lead a team of up to seven experts with experience of domain name management and on-line legal dispute resolution, with access to other teams in Amazon Legal if required.

From NeuStar, registry service provider to Amazon: A Customer Support team of 12, a Product Management Team of four and a Development/Engineering Team of 19 will be available as required to support the legal team, led by Jeff Neuman. This team has over 10 years’ experience with implementing registry launches including rights protection schemes including the .biz Sunrise and IP Claims.

In addition, Amazon will be supported by its Registrar which will provide two legal specialists, four client managers and six operational staff. The operational staff will undertake the validation checks on registration requests.

We are confident that this staffing is more than adequate for a registry where the only registrant is Amazon or its subsidiaries. Of course, should business goals change requiring more resources, Amazon will closely review any expansion plans, and plan for additional financial, technical, and team-member support to put the Registry in the best position for success.

We will also require our registrar to implement appropriate privacy policies reflecting the high standards that we operate. For information on our Privacy Policies, please see:

http://www.amazon.com/gp/help/customer/display.html/ref=footer_privacy?ie=UTF8&nodeId=468496

29.4 Additional Mechanism that exceed requirements

Rights protection is at the core of Amazon’s objective in applying for this registry. Therefore we are committed to providing the following additional mechanisms:

29.4.1 Registry Legal Manager

Amazon will appoint a Legal Manager to ensure that we are compliant with ICANN policies. The Legal Manager will also handle all disputes relating to RPMs. This will involve evaluating complaints, working with external legal counsel and law enforcement, and liaising with external stakeholders including URS and UDRP panel providers, the TMCH operator and trademark holders as needed.

29.4.2 Rights Protection Help Line

Amazon will maintain a Rights Protection Help Line. Calls to this line will be allocated a Case Number and the following details will be recorded: (i) the contact details of the complainant; (ii) the domain name that is the subject of the complaint or query; (iii) the registered right, if any, that is associated with the request; and (iv) an explanation of the concerns.

An initial response to a query or complaint will be made within 24 hours. The Rights Protection Help Line will be in place on Day One of the registry. The cost of the Rights Help Line is reflected in the Projections Templates provided at Question 46 as part of on-going registry maintenance costs.

The aim of the Rights Protection Help Line is to assist third parties in understanding the mission and purpose of our registry and to see if a resolution can be found that is quicker and easier than the filing of a UDRP or URS complaint.

The Legal Manager will oversee the Rights Protection Help Line.

29.4.3 Registrar Accreditation

Amazon will audit the performance of our registrar every six months and re-validate our Registry-Registrar Agreements annually. Our audits will include site visits to ensure the security of data etc.

29.4.4 Audits of registration records

Every three months, whichever is the most of 250 or 2% of the total of domain names registered in that period will be reviewed by our registrar to ensure accurate registration records and use that is compliant with our Acceptable Use guidelines.

29.4.5 Maintenance of Registry Website

Amazon will create a website for all our registries and we will make it easy for third parties including representatives of law enforcement to contact us by
29.4.6 Click Wrapping our Terms & Conditions
Although only Amazon and its subsidiaries can register domain names in our registry, we will bring to the attention of requestors of domain names the Terms & Conditions of registration and, especially, Acceptable Use terms through Click Wrapping.

29.4.7 Annual Report
Amazon will publish an Annual Report on Rights Protection in our registries on our Registry Website. This will include relevant statistics and it will outline all cases and how they were resolved.

29.4.8 Contacts with WIPO and other DRS providers
Amazon will invite representatives of WIPO and other DRS providers to review our RPM and to make suggestions on any improvements that we might make after the first full year of operation.

29.4.9 Registrant Pre-Verification
All requests for registration will be verified by our registrar to ensure that they come from a legitimate representative of Amazon or our subsidiaries. A record of the request will be kept in our on-line domain management console including the requestor’s email address and other contact information.

29.4.10 Take down Procedures
Amazon has described Takedown Procedures for domains supporting Abusive Behaviours in Question 28. We think this is very unlikely in a registry where only Amazon or its subsidiaries are registrants but we will reserve the right to terminate a registration and to take down all associated services after a review by our Legal Manager if a takedown for reasons of rights protection is requested by law enforcement, a representative of a court we recognise etc.

29.4.11 Speed of Response
Wherever possible, as outlined above, Amazon committed to a response within 24 hours of a complaint being made. This exceeds the guidelines for the UDRP and the URS. Please note that in the above answer the terms “We”, “Our” and “Amazon” may refer to either the applicant Amazon EU S.à r.l. or Amazon.com Inc., the ultimate parent.

30(a). Security Policy: Summary of the security policy for the proposed registry

Amazon EU S.à r.l. and our back-end operator, Neustar, recognize the vital need to secure the systems and the integrity of the data in commercial solutions. The .AMAZON registry solution will leverage industry-best security practices including the consideration of physical, network, server, and application elements.

Neustar’s approach to information security starts with comprehensive information security policies. These are based on the industry best practices for security including SANS (SysAdmin, Audit, Network, Security) Institute, NIST (National Institute of Standards and Technology), and Center for Internet Security (CIS). Policies are reviewed annually by Neustar’s information security team.

The following is a summary of the security policies that will be used in the .AMAZON registry, including:
1. Summary of the security policies used in the registry operations
2. Description of independent security assessments
3. Description of security features that are appropriate for .AMAZON
4. List of commitments made to registrants regarding security levels

All of the security policies and levels described in this section are appropriate for the .AMAZON registry.

30.(a).1 Summary of Security Policies

Neustar, Inc. has developed a comprehensive Information Security Program in order to create effective administrative, technical, and physical safeguards for the protection of its information assets, and to comply with Neustar’s obligations under
applicable law, regulations, and contracts. This Program establishes Neustar’s policies for accessing, collecting, storing, using, transmitting, and protecting electronic, paper, and other records containing sensitive information.

The Program defines:
- The policies for internal users and our clients to ensure the safe, organized and fair use of information resources.
- The rights that can be expected with that use.
- The standards that must be met to effectively comply with policy.
- The responsibilities of the owners, maintainers, and users of Neustar’s information resources.

Rules and principles used at Neustar to approach information security issues

The following policies are included in the Program:

1. Acceptable Use Policy
   The Acceptable Use Policy provides the “rules of behavior” covering all Neustar Associates for using Neustar resources or accessing sensitive information.

2. Information Risk Management Policy
   The Information Risk Management Policy describes the requirements for the on-going information security risk management program, including defining roles and responsibilities for conducting and evaluating risk assessments, assessments of technologies used to provide information security and monitoring procedures used to measure policy compliance.

3. Data Protection Policy
   The Data Protection Policy provides the requirements for creating, storing, transmitting, disclosing, and disposing of sensitive information, including data classification and labeling requirements, the requirements for data retention, Encryption and related technologies such as digital certificates are also covered under this policy.

4. Third Party Policy
   The Third Party Policy provides the requirements for handling service provider contracts, including specifically the vetting process, required contract reviews, and on-going monitoring of service providers for policy compliance.

5. Security Awareness and Training Policy
   The Security Awareness and Training Policy provide the requirements for managing the on-going awareness and training program at Neustar. This includes awareness and training activities provided to all Neustar Associates.

6. Incident Response Policy
   The Incident Response Policy provides the requirements for reacting to reports of potential security policy violations. This policy defines the necessary steps for identifying and reporting security incidents, remediation of problems, and conducting “lessons learned” post-mortem reviews in order to provide feedback on the effectiveness of this Program. Additionally, this policy contains the requirement for reporting data security breaches to the appropriate authorities and to the public, as required by law, contractual requirements, or regulatory bodies.

7. Physical and Environmental Controls Policy
   The Physical and Environmental Controls Policy provides the requirements for securely storing sensitive information and the supporting information technology equipment and infrastructure. This policy includes details on the storage of paper records as well as access to computer systems and equipment locations by authorized personnel and visitors.

8. Privacy Policy
   Neustar supports the right to privacy, including the rights of individuals to control the dissemination and use of personal data that describes them, their personal choices, or life experiences. Neustar supports domestic and international laws and regulations that seek to protect the privacy rights of such individuals.

9. Identity and Access Management Policy
   The Identity and Access Management Policy covers user accounts (login ID naming convention, assignment, authoritative source) as well as ID lifecycle (request, approval, creation, use, suspension, deletion, review), including provisions for system/application accounts, shared-group accounts, guest-public accounts, temporary-emergency accounts, administrative access, and remote access. This policy also includes the user password policy requirements.
10. Network Security Policy
The Network Security Policy covers aspects of Neustar network infrastructure and the technical controls in place to prevent and detect security policy violations.

11. Platform Security Policy
The Platform Security Policy covers the requirements for configuration management of servers, shared systems, applications, databases, middle-ware, and desktops and laptops owned or operated by Neustar Associates.

12. Mobile Device Security Policy
The Mobile Device Policy covers the requirements specific to mobile devices with information storage or processing capabilities. This policy includes laptop standards, as well as requirements for PDAs, mobile phones, digital cameras and music players, and any other removable device capable of transmitting, processing or storing information.

13. Vulnerability and Threat Management Policy
The Vulnerability and Threat Management Policy provides the requirements for patch management, vulnerability scanning, penetration testing, threat management (modeling and monitoring) and the appropriate ties to the Risk Management Policy.

14. Monitoring and Audit Policy
The Monitoring and Audit Policy covers the details regarding which types of computer events to record, how to maintain the logs, and the roles and responsibilities for how to review, monitor, and respond to log information. This policy also includes the requirements for backup, archival, reporting, forensics use, and retention of audit logs.

15. Project and System Development and Maintenance Policy
The System Development and Maintenance Policy covers the minimum security requirements for all software, application, and system development performed by or on behalf of Neustar and the minimum security requirements for maintaining information systems.

30. (a).2 Independent Assessment Reports
Neustar IT Operations is subject to yearly Sarbanes-Oxley (SOX), Statement on Auditing Standards #70 (SAS70) and ISO audits. Testing of controls implemented by Neustar management in the areas of access to programs and data, change management and IT Operations are subject to testing by both internal and external SOX and SAS70 audit groups. Audit Findings are communicated to process owners, Quality Management Group and Executive Management. Actions are taken to make process adjustments where required and remediation of issues is monitored by internal audit and QM groups. External Penetration Test is conducted by a third party on a yearly basis. As authorized by Neustar, the third party performs an external Penetration Test to review potential security weaknesses of network devices and hosts and demonstrate the impact to the environment. The assessment is conducted remotely from the Internet with testing divided into four phases:
- A network survey is performed in order to gain a better knowledge of the network that was being tested.
- Vulnerability scanning is initiated with all the hosts that are discovered in the previous phase.
- Identification of key systems for further exploitation is conducted.
- Exploitation of the identified systems is attempted.

Each phase of the audit is supported by detailed documentation of audit procedures and results. Identified vulnerabilities are classified as high, medium and low risk to facilitate management’s prioritization of remediation efforts. Tactical and strategic recommendations are provided to management supported by reference to industry best practices.

30. (a).3 Augmented Security Levels and Capabilities
There are no increased security levels specific for .AMAZON. However, Neustar will provide the same high level of security provided across all of the registries it manages.

A key to Neustar’s Operational success is Neustar’s highly structured operations practices. The standards and governance of these processes:
- Include annual independent review of information security practices
- Include annual external penetration tests by a third party
- Conform to the ISO 9001 standard (Part of Neustar’s ISO-based Quality
Management System
Are aligned to Information Technology Infrastructure Library (ITIL) and CoBIT best practices
Are aligned with all aspects of ISO IEC 17799
Are in compliance with Sarbanes-Oxley (SOX) requirements (audited annually)
Are focused on continuous process improvement (metrics driven with product scorecards reviewed monthly).
A summary view to Neustar’s security policy in alignment with ISO 17799 can be found in section 30.(a).4 below.

30.(a).4 Commitments and Security Levels
The .AMAZON registry commits to high security levels that are consistent with the needs of the TLD. These commitments include:

Compliance with High Security Standards
Security procedures and practices that are in alignment with ISO 17799
Annual SOC 2 Audits on all critical registry systems
Annual 3rd Party Penetration Tests
Annual Sarbanes Oxley Audits

Highly Developed and Document Security Policies
Compliance with all provisions described in section 30.(a).4 below and in the attached security policy document.
Resources necessary for providing information security
Fully documented security policies
Annual security training for all operations personnel

High Levels of Registry Security
Multiple redundant data centers
High Availability Design
Architecture that includes multiple layers of security
Diversified firewall and networking hardware vendors
Multi-factor authentication for accessing registry systems
Physical security access controls
A 24x7 manned Network Operations Center that monitors all systems and applications
A 24x7 manned Security Operations Center that monitors and mitigates DDoS attacks
DDoS mitigation using traffic scrubbing technologies

11(c). Name(s) and position(s) of all shareholders holding at least 15% of shares

Amazon Europe Holding Technologies S.C.S. Not Applicable

11(d). For an applying entity that does not have directors, officers, partners, or shareholders: Name(s) and position(s) of all individuals having legal or executive responsibility

Applied-for gTLD string

13. Provide the applied-for gTLD string. If an IDN, provide the U-label.

亚马逊

14(a). If an IDN, provide the A-label (beginning with "xn--").

xn--j1q480n2rg

14(b). If an IDN, provide the meaning or restatement of the string in English, that is, a description of the literal meaning of the string in the opinion of the applicant.

Amazon

14(c). If an IDN, provide the language of the label (in English).

Chinese

14(c). If an IDN, provide the language of the label (as referenced by ISO-639-1).

ZH
14(d). If an IDN, provide the script of the label (in English).

Han (simplified variant)

14(d). If an IDN, provide the script of the label (as referenced by ISO 15924).

HANS

14(e). If an IDN, list all code points contained in the U-label according to Unicode form.

U+4E9A U+9A6C U+900A

15(a). If an IDN, Attach IDN Tables for the proposed registry.

Attachments are not displayed on this form.

15(b). Describe the process used for development of the IDN tables submitted, including consultations and sources used.

Wherever possible, well-established language tables that have been published in IANA Repository of IDN Practices are adopted. Published tables, especially from a ccTLD that primarily uses the given language or script, represent valuable research and deployment experience. In the interest of interoperability, we reuse these tables in our IDN implementation.

In some instances, multiple language tables for the same language may exist, with material differences in their content. In order to determine the best approach that fits our needs and specific target audience, we may conduct research and consult reference sources such as omniglot.com and evertype.com for clarity and understand the reason for the differences.

The Chinese IDN table is based on the .biz table found on in the IANA Repository. This table has been in use for nearly five years. When it was created in 2007, it was derived from the following sources:

IDN Character Table for CNNIC: http://www.iana.org/domains/idn-tables/tables/cn_zh-cn_4.0.html
IDN Character Table for TWNIC: http://www.iana.org/domains/idn-tables/tables/tw_zh-tw_4.0.1.html

When constructing the table, Neustar consulted with various experts including representatives at CNNIC and TWNIC.

15(c). List any variant strings to the applied-for gTLD string according to the relevant IDN tables.
Variant 1
A-label: xn--jlq061n1kg
U-label: 亚马遜
Unicode: U+4E9A U+9A6C U+905C

Variant 2
A-label: xn--jlqz76b6y5b
U-label: 亚马懓
Unicode: U+4E9A U+9A6C U+613B

Variant 3
A-label: xn--jlq480nmbg
U-label: 亚馬遜
Unicode: U+4E9A U+99AC U+900A

Variant 4
A-label: xn--jlq061nl3f
U-label: 亚馬遜
Unicode: U+4E9A U+99AC U+905C

Variant 5
A-label: xn--jlqz76bqi5b
U-label: 亚馬懓
Unicode: U+4E9A U+99AC U+613B

Variant 6
A-label: xn--nlqw80n2rg
U-label: 亚马遜
Unicode: U+4E9E U+9A6C U+900A

Variant 7
A-label: xn--nlqs61n1kg
U-label: 亚马遜
Unicode: U+4E9E U+9A6C U+905C

Variant 8
A-label: xn--nlqr76b6y5b
U-label: 亚馬遜
Unicode: U+4E9E U+9A6C U+613B

Variant 9
A-label: xn--nlqw80nmbg
U-label: 亞馬遜
Unicode: U+4E9E U+99AC U+900A

Variant 10
A-label: xn--nlqs61nl3f

U-label: 亞馬遜
Unicode: U+4E9E U+99AC U+613B

Variant 12
A-label: xn--llq080n2rg
U-label: 亜马遜
Unicode: U+4E9C U+9A6C U+900A
16. Describe the applicant’s efforts to ensure that there are no known operational or rendering problems concerning the applied-for gTLD string. If such issues are known, describe steps that will be taken to mitigate these issues in software and other applications.

Amazon EU S.à r.l. (AEU) foresees no known rendering issues in connection with the .亚马逊 TLD. This is based upon consultation with AEU’s backend provider, Neustar, which has successfully launched a number of new gTLDs over the last decade. In reaching this determination, the following data points were analyzed:

- ICANN’s Security Stability Advisory Committee DSV009, Alternative TLD Name Systems and Roots: Conflict, Control & Consequences
- IAB - RFC3696 Application Techniques for Checking & Transformation of Names
- Known software issues which Neustar has encountered from launching new gTLDs
- Character type and length
- ICANN supplemental notes to Q16
- ICANN presentation during its Costa Rica regional meeting on TLD Universal Acceptance;

The following sections discuss the potential operational or rendering problems that can arise, and how mitigated.

Compliance & Interoperability
The applied-for string conforms to all relevant RFCs, as well as the string requirements set forth in s2.2.1.3.2 Applicant Guidebook.

Mixing Scripts
A domain name label with characters from different scripts has a higher likelihood of encountering rendering issues. If the mixing of scripts occurs within the top-level label, any rendering issue would affect all domain names registered under it. If occurring within second level labels, its ill-effects are confined to the domain names with such labels.

All characters in the applied-for gTLD string are taken from a single script. The IDN policies are conservative and compliant with ICANN Guidelines for the Implementation of IDN V3.0. Specifically, mixed-script labels may not be registered...
at the 2nd level, except for languages with established orthographies and conventions that require the commingled use of multiple scripts, e.g. Japanese.

Interaction between Labels
Even with the above issue appropriately restricted, it is possible that a domain name composed of labels with different properties such as script and directionality may introduce unintended rendering behavior. Only scripts and characters that would not pose a risk when combined with the top level label will be offered.

Immature Scripts
Scripts or characters added in Unicode versions newer than 3.2 (on which IDNA2003 was based) may encounter interoperability issues due to the lack of software support. We have no current plans to offer registration of labels containing such scripts or characters.

Other Issues
We are not offering the registration of domains that includes combining characters or characters that require IDNA contextual rules handling. The following may be construed as operational or rendering issues, but consider them out of the scope of this question. Nevertheless, we will take reasonable steps to protect registrants and Internet users by working with vendors and relevant language communities to mitigate such issues.

• missing fonts causing string to fail to render correctly
• universal acceptance of the TLD

17. (OPTIONAL) Provide a representation of the label according to the International Phonetic Alphabet (http://www.langsci.ucl.ac.uk/ipa/).

N/A

Mission/Purpose

18(a). Describe the mission/purpose of your proposed gTLD.

Founded in 1994, Amazon opened on the World Wide Web in July 1995 and today offers Earth’s Biggest Selection. Amazon seeks to be Earth’s most customer-centric company, where customers can find and discover anything they might want to buy online, and endeavors to offer its customers the lowest possible prices. Amazon and other sellers offer millions of unique new, refurbished and used items in categories such as Books; Movies, Music & Games; Digital Downloads; Electronics & Computers; Home & Garden; Toys, Kids & Baby; Grocery; Apparel, Shoes & Jewelry; Health & Beauty; Sports & Outdoors; and Tools, Auto & Industrial. Amazon Web Services provides Amazon’s developer customers with access to in-the-cloud infrastructure services based on Amazon’s own back-end technology platform, which developers can use to enable virtually any type of business. The new latest generation Kindle is the lightest, most compact Kindle ever and features the same 6-inch, most advanced electronic ink display that reads like real paper even in bright sunlight. Kindle Touch is a new addition to the Kindle family with an easy-to-use touch screen that makes it easier than ever to turn pages, search, shop, and take notes – still with all the benefits of the most advanced electronic ink display. Kindle Touch 3G is
the top of the line e-reader and offers the same new design and features of Kindle Touch, with the unparalleled added convenience of free 3G. Kindle Fire is the Kindle for movies, TV shows, music, books, magazines, apps, games and web browsing with all the content, free storage in the Amazon Cloud, Whispersync, Amazon Silk (Amazon’s new revolutionary cloud-accelerated web browser), vibrant color touch screen, and powerful dual-core processor.

18a

The mission of the .亚马逊 registry is:
To provide a unique and dedicated platform for Amazon while simultaneously protecting the integrity of its brand and reputation.
A .亚马逊 registry will:
• Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
• Provide Amazon a further platform for innovation.
• Enable Amazon to protect its intellectual property rights.

18(b). How do you expect that your proposed gTLD will benefit registrants, Internet users, and others?

The .亚马逊 registry will benefit registrants and internet users by offering a stable and secure foundation for online communication and interaction.

What is the goal of your proposed gTLD in terms of areas of specialty, service levels or reputation?

Amazon intends for its new .亚马逊 gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction. The .亚马逊 registry will be run in line with current industry standards of good registry practice.

What do you anticipate your proposed gTLD will add to the current space in terms of competition, differentiation or innovation?

Amazon values the opportunity to be one of the first companies to own a gTLD. A .亚马逊 registry will:
• Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
• Provide Amazon a further platform for innovation.
• Enable Amazon to protect its intellectual property rights.

What goals does your proposed gTLD have in terms of user experience?

Amazon intends for its new .亚马逊 gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction.

Provide a complete description of the applicant’s intended registration policies in support of the goals above

Amazon’s Intellectual Property group will be responsible for the development, maintenance and enforcement of a Domain Management Policy. The Domain Management Policy will define (i) the rules associated with eligibility and domain name allocation, (ii) the license terms governing the use of a .亚马逊 domain name, and (iii) the dispute resolution policies for the .亚马逊 gTLD. Amazon will continually update the Domain Management Policy as needed to reflect Amazon’s business goals and, where appropriate, ICANN consensus policies.

Registration of a domain name in the .亚马逊 registry will be undertaken in four steps: (i) Eligibility Confirmation, (ii) Naming Convention Check, (iii) Acceptable Use Review, and (iv) Registration. All domains in the .亚马逊 registry will remain
the property of Amazon. For example, on the rules of eligibility, each applied for character string must conform to the .亚马逊 rules of eligibility. Each .亚马逊 name must:

• be at least 3 characters and no more than 63 characters long
• not contain a hyphen on the 3rd and 4th position (tagged domains)
• contain only letters (a-z), numbers (0-9) and hyphens or a combination of these
• start and end with an alphanumeric character, not a hyphen
• not match any character strings reserved by ICANN
• not match any protected country names or geographical terms

Additionally:

• Internationalized domain names (IDN) may be supported in the .亚马逊 registry at the second level.
• The .亚马逊 registry will respect third party intellectual property rights.
• .亚马逊 domains may not be delegated or assigned to third party organizations, institutions, or individuals.
• All .亚马逊 domains will carry accurate and up-to-date registration records. Amazon’s Intellectual Property group reserves the right to revoke a license to use a .亚马逊 domain name, at any time, if any use of a .亚马逊 domain name violates the Domain Management Policy.

Will your proposed gTLD impose any measures for protecting the privacy of confidential information of registrants or users?

Yes. Amazon will implement appropriate privacy policies respecting requirements of local jurisdictions. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.

Describe whether and in what ways outreach and communications will help to achieve your projected benefits?

There is no foreseeable reason for Amazon to undertake public outreach or mass communication about its new gTLD registry because domains will be provisioned in line with Amazon’s business goals.

18(c). What operating rules will you adopt to eliminate or minimize social costs?

Amazon intends to initially provision a relatively small number of domains in the .亚马逊 registry to support the business goals of Amazon. These initiatives should not impose social costs of any type on consumers.

How will multiple applications for a particular domain be resolved, for example, by auction or on a first come first served basis?

Applications from Amazon and its subsidiaries for domains in the .亚马逊 registry will be considered by Amazon’s Intellectual Property group and allocated in line with Amazon’s business goals. The .亚马逊 registry will not be promoted by hundreds of registrars simultaneously, so there will not be multiple-applications for a particular domain.

Explain any cost benefits for registrants you intend to implement (e.g. advantageous pricing, introductory discounts, bulk registration discounts).

Domains in the .亚马逊 registry will be provisioned to support the business goals of Amazon. Accordingly, “cost benefits” may be explored depending on the business goals of Amazon. Amazon shares the goals of enhancing customer trust and choice.
The Registry Agreement requires that registrars be offered the option to obtain initial domain name registrations for periods of one to ten years at the discretion of the registrar, but no greater than 10 years. Additionally, the Registry Agreement requires advance written notice of price increases. Do you intend to make contractual commitments to registrants regarding the magnitude of price escalation?

The Domain Management Policy will include the costs and benefits of Amazon’s unique and dedicated platform for stable and secure online communication and interaction.

Community-based Designation

19. Is the application for a community-based TLD?

No

20(a). Provide the name and full description of the community that the applicant is committing to serve.

20(b). Explain the applicant's relationship to the community identified in 20(a).

20(c). Provide a description of the community-based purpose of the applied-for gTLD.

20(d). Explain the relationship between the applied-for gTLD string and the community identified in 20(a).

20(e). Provide a description of the applicant's intended registration policies in support of the community-based purpose of the applied-for gTLD.

20(f). Attach any written endorsements from institutions/groups representative of the community identified in 20(a).

Attachments are not displayed on this form.
Geographic Names

21(a). Is the application for a geographic name?

No

Protection of Geographic Names

22. Describe proposed measures for protection of geographic names at the second and other levels in the applied-for gTLD.

Amazon EU S.à r.l., with support of its ultimate parent company, Amazon.com, Inc. (collectively referred to in this response throughout as “Amazon”), is committed to managing the .亚马逊 registry in full compliance with all applicable laws, consensus policies, ICANN guidelines, RFCs and the Specifications of the Registry Agreement. In the management of domain names in the .亚马逊 registry, based on GAC advice and Specification 5, Amazon intends to block from initial registration those country and territory names contained in the following lists:
1. The short form (in English) of all country and territory names contained on the ISO 3166-1 list, as updated from time to time, including the European Union; and
2. The United Nations Group of Experts on Geographical Names, Technical Reference Manual for the Standardization of Geographical Names, Part III Names of Countries of the World; and

The process for reserving these names, and hence blocking them from registration, will be agreed to with our technical service provider Neustar. Because the .亚马逊 registry will be a single entity registry and for purposes which serve Amazon’s strategic business aims, the reserved names cannot be offered to Governments or other official bodies for their own use as this would conflict with the mission and purpose of the gTLD. However, for the same reason, they will not be offered to third parties.

The .亚马逊 registry only provides for the registration of names at the second level. No third level domains will be delegated at the registry level. It is consistent with GAC advice that Amazon may choose to create sub domains using country names or abbreviations at the third level. For example, Amazon may register information.亚马逊 and its internal users may create sub domains such as cn.information.亚马逊. Amazon may also use a folder structure to represent country names in its URLs, while the block exists at the second level. For example, information.亚马逊/China.

We imagine that over time, there will be demand from brand gTLDs leading to the development of a standardized process for requesting GAC review and ICANN approval for the release of country and territory names for registration by the Registry Operator when the registry is a single entity registry. When such a process is in place, Amazon expects to apply for the release of country and territory names within .亚马逊.
Registry Services

23. Provide name and full description of all the Registry Services to be provided.

23.1 Introduction

Amazon EU S.à r.l. has elected to partner with Neustar, Inc. to provide back-end services for the .亚马逊 registry. In making this decision, Amazon EU S.à r.l. recognized that Neustar already possesses a production-proven registry system that can be quickly deployed and smoothly operated over its robust, flexible, and scalable world-class infrastructure. The existing registry services will be leveraged for the .亚马逊 registry. The following section describes the registry services to be provided.

23.2 Standard Technical and Business Components

Neustar will provide the highest level of service while delivering a secure, stable and comprehensive registry platform. Amazon EU S.à r.l. will use Neustar’s Registry Services platform to deploy the .亚马逊 registry, by providing the following Registry Services (none of these services are offered in a manner that is unique to .亚马逊).

- Registry-Registrar Shared Registration Service (SRS)
- Extensible Provisioning Protocol (EPP)
- Domain Name System (DNS)
- WHOIS
- DNSSEC
- Data Escrow
- Dissemination of Zone Files using Dynamic Updates
- Access to Bulk Zone Files
- Dynamic WHOIS Updates
- IPv6 Support
- Rights Protection Mechanisms
- Internationalized Domain Names (IDN).

The following is a description of each of the services.

SRS

Neustar’s secure and stable SRS is a production-proven, standards-based, highly reliable, and high-performance domain name registration and management system. The SRS includes an EPP interface for receiving data from registrars for the purpose of provisioning and managing domain names and name servers. The response to Question 24 provides specific SRS information.

EPP

The .亚马逊 registry will use the Extensible Provisioning Protocol (EPP) for the provisioning of domain names. The EPP implementation will be fully compliant with all RFCs. Registrars are provided with access via an EPP API and an EPP based Web GUI. With more than 10 gTLD, ccTLD, and private TLDs implementations, Neustar has extensive experience building EPP-based registries. Additional discussion on the EPP approach is presented in the response to Question 25.

DNS

Amazon EU S.à r.l. will leverage Neustar’s world-class DNS network of geographically distributed nameserver sites to provide the highest level of DNS service. The service utilizes “Anycast” routing technology, and supports both IPv4 and IPv6. The DNS network is highly proven, and currently provides service to over 20 TLDs and thousands of enterprise companies. Additional information on the DNS solution is presented in the response to Questions 35.

WHOIS

Neustar’s existing standard WHOIS solution will be used for .亚马逊. The service
provides supports for near real-time dynamic updates. The design and construction is agnostic with regard to data display policy is flexible enough to accommodate any data model. In addition, a searchable WHOIS service that complies with all ICANN requirements will be provided. The following WHOIS options will be provided:

- Standard WHOIS (Port 43)
- Standard WHOIS (Web)
- Searchable WHOIS (Web)

**DNSSEC**

An RFC compliant DNSSEC implementation will be provided using existing DNSSEC capabilities. Neustar is an experienced provider of DNSSEC services, and currently manages signed zones for three large top level domains: .biz, .us, and .co.

Registrars are provided with the ability to submit and manage DS records using EPP, or through a web GUI. Additional information on DNSSEC, including the management of security extensions is found in the response to Question 43.

**Data Escrow**

Data escrow will be performed in compliance with all ICANN requirements in conjunction with an approved data escrow provider. The data escrow service will:

- Protect against data loss
- Follow industry best practices
- Ensure easy, accurate, and timely retrieval and restore capability in the event of a hardware failure
- Minimizes the impact of software or business failure.

Additional information on the Data Escrow service is provided in the response to Question 38.

**Dissemination of Zone Files using Dynamic Updates**

Dissemination of zone files will be provided through a dynamic, near real-time process. Updates will be performed within the specified performance levels. The proven technology ensures that updates pushed to all nodes within a few minutes of the changes being received by the SRS. Additional information on the DNS updates may be found in the response to Question 35.

**Access to Bulk Zone Files**

Amazon EU S.à r.l. will provide third party access to the bulk zone file in accordance with specification 4, Section 2 of the Registry Agreement. Credentialing and dissemination of the zone files will be facilitated through the Central Zone Data Access Provider.

**Dynamic WHOIS Updates**

Updates to records in the WHOIS database will be provided via dynamic, near real-time updates. Guaranteed delivery message oriented middleware is used to ensure each individual WHOIS server is refreshed with dynamic updates. This component ensures that all WHOIS servers are kept current as changes occur in the SRS, while also decoupling WHOIS from the SRS. Additional information on WHOIS updates is presented in response to Question 26.

**IPv6 Support**

The registry will provide IPv6 support in the following registry services: SRS, WHOIS, and DNS-DNSSEC. In addition, the registry supports the provisioning of IPv6 AAAA records. A detailed description on IPv6 is presented in the response to Question 36.

**Required Rights Protection Mechanisms**

Amazon EU S.à r.l. will provide all ICANN required Rights Mechanisms, including:

- Trademark Claims Service
- Trademark Post-Delegation Dispute Resolution Procedure (PDDRP)
- Registration Restriction Dispute Resolution Procedure (RRDRP)
- UDRP
- URS
- Sunrise service.

More information is presented in the response to Question 29.

**Internationalized Domain Names (IDN)**

IDN registrations are provided in full compliance with the IDNA protocol. Neustar possesses extensive experience offering IDN registrations in numerous TLDs, and its IDN implementation uses advanced technology to accommodate the unique bundling needs of certain languages. Character mappings are easily constructed to block out
characters that may be deemed as confusing to users. A detailed description of the IDN implementation is presented in response to Question 44.

23.3 Unique Services
Amazon EU S.à r.l. will not be offering services that are unique to .亚马逊.

23.4 Security or Stability Concerns
All services offered are standard registry services that have no known security or stability concerns. Neustar has demonstrated a strong track record of security and stability within the industry.

Demonstration of Technical & Operational Capability

24. Shared Registration System (SRS) Performance

24.1 Introduction
Amazon EU S.à r.l. has partnered with Neustar, Inc., an experienced TLD registry operator, for the operation of the .亚马逊 Registry. Amazon EU S.à r.l. is confident that the plan in place for the operation of a robust and reliable Shared Registration System (SRS) as currently provided by Neustar will satisfy the criterion established by ICANN.

Neustar built its SRS from the ground up as an EPP based platform and has been operating it reliably and at scale since 2001. The software currently provides registry services to five TLDs (.BIZ, .US, TEL, .CO and .TRAVEL) and is used to provide gateway services to the .CN and .TW registries. Neustar’s state of the art registry has a proven track record of being secure, stable, and robust. It manages more than 6 million domains, and has over 300 registrars connected today.

The following describes a detailed plan for a robust and reliable SRS that meets all ICANN requirements including compliance with Specifications 6 and 10.

24.2 The Plan for Operation of a Robust and Reliable SRS

High-level SRS System Description
The SRS to be used for .亚马逊 will leverage a production-proven, standards-based, highly reliable and high-performance domain name registration and management system that fully meets or exceeds the requirements as identified in the new gTLD Application Guidebook.

The SRS is the central component of any registry implementation and its quality, reliability and capabilities are essential to the overall stability of the TLD. Neustar has a documented history of deploying SRS implementations with proven and verifiable performance, reliability and availability. The SRS adheres to all industry standards and protocols. By leveraging an existing SRS platform, Amazon EU S.à r.l. is mitigating the significant risks and costs associated with the development of a new system. Highlights of the SRS include:

- State-of-the-art, production proven multi-layer design
- Ability to rapidly and easily scale from low to high volume as a TLD grows
- Fully redundant architecture at two sites
- Support for IDN registrations in compliance with all standards
- Use by over 300 Registrars
- EPP connectivity over IPv6
- Performance being measured using 100% of all production transactions (not sampling).

SRS Systems, Software, Hardware, and Interoperability
The systems and software that the registry operates on are a critical element to providing a high quality of service. If the systems are of poor quality, if they are difficult to maintain and operate, or if the registry personnel are unfamiliar with them, the registry will be prone to outages. Neustar has a decade of experience operating registry infrastructure to extremely high service level requirements. The
infrastructure is designed using best of breed systems and software. Much of the application software that performs registry-specific operations was developed by the current engineering team and as a result the team is intimately familiar with its operations.

The architecture is highly scalable and provides the same high level of availability and performance as volumes increase. It combines load balancing technology with scalable server technology to provide a cost effective and efficient method for scaling.

The Registry is able to limit the ability of any one registrar from adversely impacting other registrars by consuming too many resources due to excessive EPP transactions. The system uses network layer 2 level packet shaping to limit the number of simultaneous connections registrars can open to the protocol layer. All interaction with the Registry is recorded in log files. Log files are generated at each layer of the system. These log files record at a minimum:

- The IP address of the client
- Timestamp
- Transaction Details
- Processing Time.

In addition to logging of each and every transaction with the SRS Neustar maintains audit records, in the database, of all transformational transactions. These audit records allow the Registry, in support of Amazon EU S.à r.l., to produce a complete history of changes for any domain name.

**SRS Design**

The SRS incorporates a multi-layer architecture that is designed to mitigate risks and easily scale as volumes increase. The three layers of the SRS are:

- Protocol Layer
- Business Policy Layer
- Database.

Each of the layers is described below.

**Protocol Layer**

The first layer is the protocol layer, which includes the EPP interface to registrars. It consists of a high availability farm of load-balanced EPP servers. The servers are designed to be fast processors of transactions. The servers perform basic validations and then feed information to the business policy engines as described below. The protocol layer is horizontally scalable as dictated by volume. The EPP servers authenticate against a series of security controls before granting service, as follows:

- The registrar’s host exchanges keys to initiate a TLS handshake session with the EPP server.
- The registrar’s host must provide credentials to determine proper access levels.
- The registrar’s IP address must be preregistered in the network firewalls and traffic-shapers.

**Business Policy Layer**

The Business Policy Layer is the “brain” of the registry system. Within this layer, the policy engine servers perform rules-based processing as defined through configurable attributes. This process takes individual transactions, applies various validation and policy rules, persists data and dispatches notification through the central database in order to publish to various external systems. External systems fed by the Business Policy Layer include backend processes such as dynamic update of DNS, WHOIS and Billing.

Similar to the EPP protocol farm, the SRS consists of a farm of application servers within this layer. This design ensures that there is sufficient capacity to process every transaction in a manner that meets or exceeds all service level requirements. Some registries couple the business logic layer directly in the protocol layer or within the database. This architecture limits the ability to scale the registry. Using a decoupled architecture enables the load to be distributed among farms of inexpensive servers that can be scaled up or down as demand changes.

The SRS today processes over 30 million EPP transactions daily.

**Database**

The database is the third core components of the SRS. The primary function of the SRS database is to provide highly reliable, persistent storage for all registry
information required for domain registration services. The database is highly secure, with access limited to transactions from authenticated registrars, trusted application-server processes, and highly restricted access by the registry database administrators. A full description of the database can be found in response to Question 33.

Figure 24-1 depicts the overall SRS architecture including network components.

Number of Servers
As depicted in the SRS architecture diagram above Neustar operates a high availability architecture where at each level of the stack there are no single points of failures. Each of the network level devices run with dual pairs as do the databases. For the .亚马逊 registry, the SRS will operate with 8 protocol servers and 6 policy engine servers. These expand horizontally as volume increases due to additional TLDs, increased load, and through organic growth. In addition to the SRS servers described above, there are multiple backend servers for services such as DNS and WHOIS. These are discussed in detail within those respective response sections.

Description of Interconnectivity with Other Registry Systems
The core SRS service interfaces with other external systems via Neustar’s external systems layer. The services that the SRS interfaces with include:
- WHOIS
- DNS
- Billing
- Data Warehouse (Reporting and Data Escrow).

Other external interfaces may be deployed to meet the unique needs of a TLD. At this time there are no additional interfaces planned for .亚马逊.

The SRS includes an “external notifier” concept in its business policy engine as a message dispatcher. This design allows time-consuming backend processing to be decoupled from critical online registrar transactions. Using an external notifier solution, the registry can utilize “control levers” that allow it to tune or to disable processes to ensure optimal performance at all times. For example, during the early minutes of a TLD launch, when unusually high volumes of transactions are expected, the registry can elect to suspend processing of one or more back end systems in order to ensure that greater processing power is available to handle the increased load requirements. This proven architecture has been used with numerous TLD launches, some of which have involved the processing of over tens of millions of transactions in the opening hours. The following are the standard three external notifiers used the SRS:
- WHOIS External Notifier
- DNS External Notifier
- Billing External Notifier

WHOIS External Notifier
The WHOIS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on WHOIS. It is important to note that, while the WHOIS external notifier feeds the WHOIS system, it intentionally does not have visibility into the actual contents of the WHOIS system. The WHOIS external notifier serves just as a tool to send a signal to the WHOIS system that a change is ready to occur. The WHOIS system possesses the intelligence and data visibility to know exactly what needs to change in WHOIS. See response to Question 26 for greater detail.

DNS External Notifier
The DNS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on DNS. Like the WHOIS external notifier, the DNS external notifier does not have visibility into the actual contents of the DNS zones. The work items that are generated by the notifier indicate to the dynamic DNS update sub-system that a change occurred that may impact DNS. That DNS system has the ability to decide what actual changes must be propagated out to the DNS constellation. See response to Question 35 for greater detail.

Billing External Notifier
The billing external notifier is responsible for sending all billable transactions to the downstream financial systems for billing and collection. This external notifier contains the necessary logic to determine what types of transactions are billable. The financial systems use this information to apply appropriate debits and credits based on registrar.
The data warehouse is responsible for managing reporting services, including registrar reports, business intelligence dashboards, and the processing of data escrow files. The Reporting Database is used to create both internal and external reports, primarily to support registrar billing and contractual reporting requirement. The data warehouse databases are updated on a daily basis with full copies of the production SRS data.

Frequency of Synchronization between Servers
The external notifiers discussed above perform updates in near real-time, well within the prescribed service level requirements. As transactions from registrars update the core SRS, update notifications are pushed to the external systems such as DNS and WHOIS. These updates are typically live in the external system within 2-3 minutes.

Synchronization Scheme (e.g., hot standby, cold standby)
Neustar operates two hot databases within the data center that is operating in primary mode. These two databases are kept in sync via synchronous replication. Additionally, there are two databases in the secondary data center. These databases are updated real time through asynchronous replication. This model allows for high performance while also ensuring protection of data. See response to Question 33 for greater detail.

Compliance with Specification 6 Section 1.2
The SRS implementation for .亚马逊 is fully compliant with Specification 6, including section 1.2. EPP Standards are described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. Extensible Provisioning Protocol or EPP is defined by a core set of RFCs that standardize the interface that make up the registry-registrar model. The SRS interface supports EPP 1.0 as defined in the following RFCs shown in Table 24-1.

Additional information on the EPP implementation and compliance with RFCs can be found in the response to Question 25.

Compliance with Specification 10
Specification 10 of the New TLD Agreement defines the performance specifications of the TLD, including service level requirements related to DNS, RDDS (WHOIS), and EPP. The requirements include both availability and transaction response time measurements. As an experienced registry operator, Neustar has a long and verifiable track record of providing registry services that consistently exceed the performance specifications stipulated in ICANN agreements. This same high level of service will be provided for the .亚马逊 Registry. The following section describes Neustar’s experience and its capabilities to meet the requirements in the new agreement.

To properly measure the technical performance and progress of TLDs, Neustar collects data on key essential operating metrics. These measurements are key indicators of the performance and health of the registry. Neustar’s current .biz SLA commitments are among the most stringent in the industry today, and exceed the requirements for new TLDs. Table 24-2 compares the current SRS performance levels compared to the requirements for new TLDs, and clearly demonstrates the ability of the SRS to exceed those requirements.

Their ability to commit and meet such high performance standards is a direct result of their philosophy towards operational excellence. See response to Question 31 for a full description of their philosophy for building and managing for performance.

24.3 Resourcing Plans
The development, customization, and on-going support of the SRS are the responsibility of a combination of technical and operational teams, including:

- Development/Engineering
- Database Administration
- Systems Administration
- Network Engineering.

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will be involved in the design and testing. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably.
The necessary resources will be pulled from the pool of operational resources described in detail in the response to Question 31. Neustar’s SRS implementation is very mature, and has been in production for over 10 years. As such, very little new development related to the SRS will be required for the implementation of the .亚马逊 registry. The following resources are available from those teams:

- Development/Engineering - 19 employees
- Database Administration - 10 employees
- Systems Administration - 24 employees
- Network Engineering - 5 employees

The resources are more than adequate to support the SRS needs of all the TLDs operated by Neustar, including the .亚马逊 registry.

25. Extensible Provisioning Protocol (EPP)

25.1 Introduction

Amazon EU S.à r.l.’s back-end registry operator, Neustar, has over 10 years of experience operating EPP based registries. They deployed one of the first EPP registries in 2001 with the launch of .biz. In 2004, they were the first gTLD to implement EPP 1.0. Over the last ten years Neustar has implemented numerous extensions to meet various unique TLD requirements. Neustar will leverage its extensive experience to ensure Amazon EU S.à r.l. is provided with an unparalleled EPP based registry. The following discussion explains the EPP interface which will be used for the .亚马逊 registry. This interface exists within the protocol farm layer as described in Question 24 and is depicted in Figure 25-1.

25.2 EPP Interface

Registrars are provided with two different interfaces for interacting with the registry. Both are EPP based, and both contain all the functionality necessary to provision and manage domain names. The primary mechanism is an EPP interface to connect directly with the registry. This is the interface registrars will use for most of their interactions with the registry. However, an alternative web GUI (Registry Administration Tool) that can also be used to perform EPP transactions will be provided. The primary use of the Registry Administration Tool is for performing administrative or customer support tasks. The main features of the EPP implementation are:

- Standards Compliance: The EPP XML interface is compliant to the EPP RFCs. As future EPP RFCs are published or existing RFCs are updated, Neustar makes changes to the implementation keeping in mind of any backward compatibility issues.
- Scalability: The system is deployed keeping in mind that it may be required to grow and shrink the footprint of the Registry system for a particular TLD.
- Fault-tolerance: The EPP servers are deployed in two geographically separate data centers to provide for quick failover capability in case of a major outage in a particular data center. The EPP servers adhere to strict availability requirements defined in the SLAs.
- Configurability: The EPP extensions are built in a way that they can be easily configured to turn on or off for a particular TLD.
- Extensibility: The software is built ground up using object oriented design. This allows for easy extensibility of the software without risking the possibility of the change rippling through the whole application.
- Auditable: The system stores detailed information about EPP transactions from provisioning to DNS and WHOIS publishing. In case of a dispute regarding a name registration, the Registry can provide comprehensive audit information on EPP transactions.
- Security: The system provides IP address based access control, client credential-based authorization test, digital certificate exchange, and connection limiting to the protocol layer.

25.3 Compliance with RFCs and Specifications

The registry-registrar model is described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. As shown in Table
25-1, EPP is defined by the core set of RFCs that standardize the interface that registrars use to provision domains with the SRS. As a core component of the SRS architecture, the implementation is fully compliant with all EPP RFCs.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to EPP. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

Neustar has a long history of providing exceptional service that exceeds all performance specifications. The SRS and EPP interface have been designed to exceed the EPP specifications defined in Specification 10 of the Registry Agreement and profiled in Table 25-2. Evidence of Neustar’s ability to perform at these levels can be found in the .biz monthly progress reports found on the ICANN website.

EPP Toolkits

Toolkits, under open source licensing, are freely provided to registrars for interfacing with the SRS. Both Java and C++ toolkits will be provided, along with the accompanying documentation. The Registrar Tool Kit (RTK) is a software development kit (SDK) that supports the development of a registrar software system for registering domain names in the registry using EPP. The SDK consists of software and documentation as described below.

The software consists of working Java and C++ EPP common APIs and samples that implement the EPP core functions and EPP extensions used to communicate between the registry and registrar. The RTK illustrates how XML requests (registration events) can be assembled and forwarded to the registry for processing. The software provides the registrar with the basis for a reference implementation that conforms to the EPP registry-registrar protocol. The software component of the SDK also includes XML schema definition files for all Registry EPP objects and EPP object extensions. The RTK also includes a “dummy” server to aid in the testing of EPP clients. The accompanying documentation describes the EPP software package hierarchy, the object data model, and the defined objects and methods (including calling parameter lists and expected response behavior). New versions of the RTK are made available from time to time to provide support for additional features as they become available and support for other platforms and languages.

25.4 Proprietary EPP Extensions

The .亚马逊 registry will not include proprietary EPP extensions. Neustar has implemented various EPP extensions for both internal and external use in other TLD registries. These extensions use the standard EPP extension framework described in RFC 5730. Table 25-3 provides a list of extensions developed for other TLDs. Should the .亚马逊 registry require an EPP extension at some point in the future, the extension will be implemented in compliance with all RFC specifications including RFC 3735.

The full EPP schema to be used in the .亚马逊 registry is attached in the document titled “EPP Schema.”

25.5 Resourcing Plans

The development and support of EPP is largely the responsibility of the Development-Engineering and Quality Assurance teams. As an experience registry operator with a fully developed EPP solution, on-going support is largely limited to periodic updates to the standard and the implementation of TLD specific extensions. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:

Development-Engineering - 19 employees
26. Whois

26.1 Introduction
Amazon EU S.à r.l. recognizes the importance of an accurate, reliable, and up-to-date WHOIS database to governments, law enforcement, intellectual property holders and the public as a whole and is firmly committed to complying with all of the applicable WHOIS specifications for data objects, bulk access, and lookups as defined in Specifications 4 and 10 to the Registry Agreement. Amazon EU S.à r.l.’s back-end registry services provider, Neustar, has extensive experience providing ICANN and RFC-compliant WHOIS services for each of the TLDs that it operates both as a Registry Operator for gTLDs, ccTLDs and back-end registry services provider. As one of the first “thick” registry operators in the gTLD space, Neustar’s WHOIS service has been designed from the ground up to display as much information as required by a TLD and respond to a very stringent availability and performance requirement.

Some of the key features of .亚马逊’s solution include:
- Fully compliant with all relevant RFCs including 3912
- Production proven, highly flexible, and scalable with a track record of 100% availability over the past 10 years
- Exceeds current and proposed performance specifications
- Supports dynamic updates with the capability of doing bulk updates
- Geographically distributed sites to provide greater stability and performance

In addition, .亚马逊’s thick-WHOIS solution also provides for additional search capabilities and mechanisms to mitigate potential forms of abuse as discussed below. (e.g., IDN, registrant data).

26.2 Software Components
The WHOIS architecture comprises the following components:
- An in-memory database local to each WHOIS node: To provide for the performance needs, the WHOIS data is served from an in-memory database indexed by searchable keys.
- Redundant servers: To provide for redundancy, the WHOIS updates are propagated to a cluster of WHOIS servers that maintain an independent copy of the database.
- Attack resistant: To ensure that the WHOIS system cannot be abused using malicious queries or DOS attacks, the WHOIS server is only allowed to query the local database and rate limits on queries based on IPs and IP ranges can be readily applied.
- Accuracy auditor: To ensure the accuracy of the information served by the WHOIS servers, a daily audit is done between the SRS information and the WHOIS responses for the domain names which are updated during the last 24-hour period. Any discrepancies are resolved proactively.
- Modular design: The WHOIS system allows for filtering and translation of data elements between the SRS and the WHOIS database to allow for customizations.
- Scalable architecture: The WHOIS system is scalable and has a very small footprint. Depending on the query volume, the deployment size can grow and shrink quickly.
- Flexible: It is flexible enough to accommodate thin, thick, or modified thick models and can accommodate any future ICANN policy, such as different information display levels based on user categorization.
- SRS master database: The SRS database is the main persistent store of the Registry information. The Update Agent computes what WHOIS updates need to be pushed out. A publish-subscribe mechanism then takes these incremental updates and pushes to all the WHOIS slaves that answer queries.

26.3 Compliance with RFC and Specifications 4 and 10
Neustar has been running thick-WHOIS Services for over 10+ years in full compliance with RFC 3912 and with Specifications 4 and 10 of the Registry Agreement. RFC 3912 is a simple text based protocol over TCP that describes the interaction between the server and client on port 43. Neustar built a home-grown solution for this service. It processes millions of WHOIS queries per day. Table 26-1 describes Neustar’s compliance with Specifications 4 and 10.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to WHOIS. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

26.4 High-level WHOIS System Description
26.4.1 WHOIS Service (port 43)
The WHOIS service is responsible for handling port 43 queries. Our WHOIS is optimized for speed using an in-memory database and master-slave architecture between the SRS and WHOIS slaves. The WHOIS service also has built-in support for IDN. If the domain name being queried is an IDN, the returned results include the language of the domain name, the domain name’s UTF-8 encoded representation along with the Unicode code page.

26.4.2 Web Page for WHOIS queries
In addition to the WHOIS Service on port 43, Neustar provides a web based WHOIS application (www.whois.亚马逊). It is an intuitive and easy to use application for the general public to use. WHOIS web application provides all of the features available in the port 43 WHOIS. This includes full and partial search on:

- Domain names
- Nameservers
- Registrant, Technical and Administrative Contacts
- Registrars

It also provides features not available on the port 43 service. These include:

1. Redemption Grace Period calculation: Based on the registry’s policy, domains in pendingDelete can be restorable or scheduled for release depending on the date/time the domain went into pendingDelete. For these domains, the web based WHOIS displays “Restorable” or “Scheduled for Release” to clearly show this additional status to the user.
2. Extensive support for international domain names (IDN)
3. Ability to perform WHOIS lookups on the actual Unicode IDN
4. Display of the actual Unicode IDN in addition to the ACE-encoded name
5. A Unicode to Punycode and Punycode to Unicode translator
6. An extensive FAQ
7. A list of upcoming domain deletions

26.5 IT and Infrastructure Resources
As described above the WHOIS architecture uses a workflow that decouples the update process from the SRS. This ensures SRS performance is not adversely affected by the load requirements of dynamic updates. It is also decoupled from the WHOIS lookup agent to ensure the WHOIS service is always available and performing well for users. Each of Neustar’s geographically diverse WHOIS sites use:

- Firewalls, to protect this sensitive data
- Dedicated servers for MQ Series, to ensure guaranteed delivery of WHOIS updates
- Packetshaper for source IP address-based bandwidth limiting
- Load balancers to distribute query load
- Multiple WHOIS servers for maximizing the performance of WHOIS service.

The WHOIS service uses HP BL 460C servers, each with 2 X Quad Core CPU and a 64GB of RAM. The existing infrastructure has 6 servers, but is designed to be easily scaled with additional servers should it be needed.

Figure 26-1 depicts the different components of the WHOIS architecture.
26.6 Interconnectivity with Other Registry System

As described in Question 24 about the SRS and further in response to Question 31, "Technical Overview", when an update is made by a registrar that impacts WHOIS data, a trigger is sent to the WHOIS system by the external notifier layer. The update agent processes these updates, transforms the data if necessary and then uses messaging oriented middleware to publish all updates to each WHOIS slave. The local update agent accepts the update and applies it to the local in-memory database. A separate auditor compares the data in WHOIS and the SRS daily and monthly to ensure accuracy of the published data.

26.7 Frequency of Synchronization between Servers

Updates from the SRS, through the external notifiers, to the constellation of independent WHOIS slaves happens in real-time via an asynchronous publish-subscribe messaging architecture. The updates are guaranteed to be updated in each slave within the required SLA of 95% ≤ 60 minutes. Please note that Neustar’s current architecture is built towards the stricter SLAs (95% ≤ 15 minutes) of .BIZ. The vast majority of updates tend to happen within 2-3 minutes.

26.8 Provision for Searchable WHOIS Capabilities

Neustar will create a new web-based service to address the new search features based on requirements specified in Specification 4 Section 1.8. The application will enable users to search the WHOIS directory using any one or more of the following fields:

- Domain name
- Registrar ID
- Contacts and registrant’s name
- Contact and registrant’s postal address, including all the sub-fields described in EPP (e.g., street, city, state or province, etc.)
- Name server name and name server IP address

The system will also allow search using non-Latin character sets which are compliant with IDNA specification. The user will choose one or more search criteria, combine them by Boolean operators (AND, OR, NOT) and provide partial or exact match regular expressions for each of the criterion name-value pairs. The domain names matching the search criteria will be returned to the user.

Figure 26-2 shows an architectural depiction of the new service.

Potential Forms of Abuse

As recognized by the Terms of Reference for Whois Misuse Studies, http://gnso.icann.org/issues/whois/tor-whois-misuse-studies-25sep09-en.pdf, a number of reported and recorded harmful acts, such as spam, phishing, identity theft, and stalking which Registrants believe were sent using WHOIS contact information. Although these Whois studies are still underway, there is a general belief that public access to Whois data may lead to a measurable degree of misuse - that is, to actions that cause actual harm, are illegal or illegitimate, or otherwise contrary to the stated legitimate purpose. One of the other key focuses of these studies will be to correlate the reported incidents of harmful acts with anti-harvesting measures that some Registrars and Registries apply to WHOIS queries (e.g., rate limiting, CAPTCHA, etc.).

Neustar firmly believes that adding the increased search capabilities, without appropriate controls could exacerbate the potential abuses associated with the Whois service. To mitigate the risk of this powerful search service being abused by unscrupulous data miners, a layer of security will be built around the query engine which will allow the registry to identify rogue activities and then take appropriate measures. Potential abuses include, but are not limited to:

- Data Mining
- Unauthorized Access
- Excessive Querying
- Denial of Service Attacks

To mitigate the abuses noted above, Neustar will implement any or all of these mechanisms as appropriate:

Username-password based authentication
Certificate based authentication
Data encryption
CAPTCHA mechanism to prevent robo invocation of Web query
Fee-based advanced query capabilities for premium customers.
The searchable WHOIS application will adhere to all privacy laws and policies of the .亚马逊 registry.

26.9 Resourcing Plans
As with the SRS, the development, customization, and on-going support of the WHOIS service is the responsibility of a combination of technical and operational teams. The primary groups responsible for managing the service include:
- Development/Engineering - 19 employees
- Database Administration - 10 employees
- Systems Administration - 24 employees
- Network Engineering - 5 employees

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will also be involved. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31.

Neustar’s WHOIS implementation is very mature, and has been in production for over 10 years. As such, very little new development will be required to support the implementation of the .亚马逊 registry. The resources are more than adequate to support the WHOIS needs of all the TLDs operated by Neustar, including the .亚马逊 registry.

27. Registration Life Cycle

27.1 Registration Life Cycle
Introduction
.亚马逊 will follow the lifecycle and business rules found in the majority of gTLDs today. Our back-end operator, Neustar, has over ten years of experience managing numerous TLDs that utilize standard and unique business rules and lifecycles. This section describes the business rules, registration states, and the overall domain lifecycle that will be used for .亚马逊.
Domain Lifecycle - Description
The registry will use the EPP 1.0 standard for provisioning domain names, contacts and hosts. Each domain record is comprised of three registry object types: domain, contacts, and hosts.

Domains, contacts and hosts may be assigned various EPP defined statuses indicating either a particular state or restriction placed on the object. Some statuses may be applied by the Registrar; other statuses may only be applied by the Registry. Statuses are an integral part of the domain lifecycle and serve the dual purpose of indicating the particular state of the domain and indicating any restrictions placed on the domain. The EPP standard defines 17 statuses, however only 14 of these statuses will be used in the .亚马逊 registry per the defined .亚马逊 business rules. The following is a brief description of each of the statuses. Server statuses may only be applied by the Registry, and client statuses may be applied by the Registrar.

- OK – Default status applied by the Registry.
- Inactive – Default status applied by the Registry if the domain has less than 2 nameservers.
- PendingCreate – Status applied by the Registry upon processing a successful Create command, and indicates further action is pending. This status will not be used in the .亚马逊 registry.
- PendingTransfer – Status applied by the Registry upon processing a successful Transfer request command, and indicates further action is pending.
- PendingDelete – Status applied by the Registry upon processing a successful Delete command that does not result in the immediate deletion of the domain, and indicates further action is pending.
- PendingRenew – Status applied by the Registry upon processing a successful
Renew command that does not result in the immediate renewal of the domain, and
indicates further action is pending. This status will not be used in the .amazon registry.
PendingUpdate – Status applied by the Registry if an additional action is
expected to complete the update, and indicates further action is pending. This
status will not be used in the .amazon registry.
Hold – Removes the domain from the DNS zone.
UpdateProhibited – Prevents the object from being modified by an Update
command.
TransferProhibited – Prevents the object from being transferred to another
Registrar by the Transfer command.
RenewProhibited – Prevents a domain from being renewed by a Renew command.
DeleteProhibited – Prevents the object from being deleted by a Delete
command.
The lifecycle of a domain begins with the registration of the domain. All
registrations must follow the EPP standard, as well as the specific business rules
described in the response to Question 18 above. Upon registration a domain will
either be in an active or inactive state. Domains in an active state are delegated
and have their delegation information published to the zone. Inactive domains
either have no delegation information or their delegation information in not
published in the zone. Following the initial registration of a domain, one of five
actions may occur during its lifecycle:
Domain may be updated
Domain may be deleted, either within or after the add-grace period
Domain may be renewed at anytime during the term
Domain may be auto-renewed by the Registry
Domain may be transferred to another registrar.
Each of these actions may result in a change in domain state. This is described in
more detail in the following section. Every domain must eventually be renewed,
auto-renewed, transferred, or deleted. A registrar may apply EPP statuses
described above to prevent specific actions such as updates, renewals, transfers, or
deletions.

27.1.1 Registration States
Domain Lifecycle – Registration States
As described above the .amazon registry will implement a standard domain
lifecycle found in most gTLD registries today. There are five possible domain
states:
Active
Inactive
Locked
Pending Transfer
Pending Delete.
All domains are always in either an Active or Inactive state, and throughout the
course of the lifecycle may also be in a Locked, Pending Transfer, and Pending
Delete state. Specific conditions such as applied EPP policies and registry
business rules will determine whether a domain can be transitioned between states.
Additionally, within each state, domains may be subject to various timed events such
as grace periods, and notification periods.
Active State
The active state is the normal state of a domain and indicates that delegation data
has been provided and the delegation information is published in the zone. A domain
in an Active state may also be in the Locked or Pending Transfer states.
Inactive State
The Inactive state indicates that a domain has not been delegated or that the
delegation data has not been published to the zone. A domain in an Inactive state
may also be in the Locked or Pending Transfer states. By default all domain in the
Pending Delete state are also in the Inactive state.
Locked State
The Locked state indicates that certain specified EPP transactions may not be
performed to the domain. A domain is considered to be in a Locked state if at least
one restriction has been placed on the domain; however up to eight restrictions may
be applied simultaneously. Domains in the Locked state will also be in the Active or Inactive, and under certain conditions may also be in the Pending Transfer or Pending Delete states.

Pending Transfer State

The Pending Transfer state indicates a condition in which there has been a request to transfer the domain from one registrar to another. The domain is placed in the Pending Transfer state for a period of time to allow the current (losing) registrar to approve (ack) or reject (nack) the transfer request. Registrars may only nack requests for reasons specified in the Inter-Registrar Transfer Policy.

Pending Delete State

The Pending Delete State occurs when a Delete command has been sent to the Registry after the first 5 days (120 hours) of registration. The Pending Delete period is 35-days during which the first 30-days the name enters the Redemption Grace Period (RGP) and the last 5-days guarantee that the domain will be purged from the Registry Database and available to public pool for registration on a first come, first serve basis.

27.1.2 Typical Registration Lifecycle Activities

Domain Creation Process

The creation (registration) of domain names is the fundamental registry operation. All other operations are designed to support or compliment a domain creation. The following steps occur when a domain is created.

1. Contact objects are created in the SRS database. The same contact object may be used for each contact type, or they may all be different. If the contacts already exist in the database this step may be skipped.
2. Nameservers are created in the SRS database. Nameservers are not required to complete the registration process; however any domain with less than 2 name servers will not be resolvable.
3. The domain is created using the each of the objects created in the previous steps. In addition, the term and any client statuses may be assigned at the time of creation.

The actual number of EPP transactions needed to complete the registration of a domain name can be as few as one and as many as 40. The latter assumes seven distinct contacts and 13 nameservers, with Check and Create commands submitted for each object.

Update Process

Registry objects may be updated (modified) using the EPP Modify operation. The Update transaction updates the attributes of the object.

For example, the Update operation on a domain name will only allow the following attributes to be updated:

- Domain statuses
- Registrant ID
- Administrative Contact ID
- Billing Contact ID
- Technical Contact ID
- Nameservers
- AuthInfo
- Additional Registrar provided fields.

The Update operation will not modify the details of the contacts. Rather it may be used to associate a different contact object (using the Contact ID) to the domain name. To update the details of the contact object the Update transaction must be applied to the contact itself. For example, if an existing registrant wished to update the postal address, the Registrar would use the Update command to modify the contact object, and not the domain object.

Renew Process

The term of a domain may be extended using the EPP Renew operation. ICANN policy general establishes the maximum term of a domain name to be 10 years, and Neustar recommends not deviating from this policy. A domain may be renewed-extended at any point time, even immediately following the initial registration. The only stipulation is that the overall term of the domain name may not exceed 10 years. If a Renew operation is performed with a term value will extend the domain beyond the 10 year limit, the Registry will reject the transaction entirely.
Transfer Process
The EPP Transfer command is used for several domain transfer related operations:
- Initiate a domain transfer
- Cancel a domain transfer
- Approve a domain transfer
- Reject a domain transfer.
To transfer a domain from one Registrar to another the following process is followed:
4. The gaining (new) Registrar submits a Transfer command, which includes the AuthInfo code of the domain name.
5. If the AuthInfo code is valid and the domain is not in a status that does not allow transfers the domain is placed into pendingTransfer status
6. A poll message notifying the losing Registrar of the pending transfer is sent to the Registrar’s message queue
7. The domain remains in pendingTransfer status for up to 120 hours, or until the losing (current) Registrar Ack (approves) or Nack (rejects) the transfer request
8. If the losing Registrar has not Acked or Nacked the transfer request within the 120 hour timeframe, the Registry auto-approves the transfer
9. The requesting Registrar may cancel the original request up until the transfer has been completed.
A transfer adds an additional year to the term of the domain. In the event that a transfer will cause the domain to exceed the 10 year maximum term, the Registry will add a partial term up to the 10 year limit. Unlike with the Renew operation, the Registry will not reject a transfer operation.
Deletion Process
A domain may be deleted from the SRS using the EPP Delete operation. The Delete operation will result in either the domain being immediately removed from the database or the domain being placed in pendingDelete status. The outcome is dependent on when the domain is deleted. If the domain is deleted within the first five days (120 hours) of registration, the domain is immediately removed from the database. A deletion at any other time will result in the domain being placed in pendingDelete status and entering the Redemption Grace Period (RGP). Additionally, domains that are deleted within five days (120) hours of any billable (add, renew, transfer) transaction may be deleted for credit.
27.1.3 Applicable Time Elements
The following section explains the time elements that are involved.
Grace Periods
There are six grace periods:
- Add-Delete Grace Period (AGP)
- Renew-Delete Grace Period
- Transfer-Delete Grace Period
- Auto-Renew-Delete Grace Period
- Auto-Renew Grace Period
- Redemption Grace Period (RGP).
The first four grace periods listed above are designed to provide the Registrar with the ability to cancel a revenue transaction (add, renew, or transfer) within a certain period of time and receive a credit for the original transaction. The following describes each of these grace periods in detail.
Add-Delete Grace Period
The AGP is associated with the date the Domain was registered. Domains may be deleted for credit during the initial 120 hours of a registration, and the Registrar will receive a billing credit for the original registration. If the domain is deleted during the Add Grace Period, the domain is dropped from the database immediately and a credit is applied to the Registrar’s billing account.
Renew-Delete Grace Period
The Renew-Delete Grace Period is associated with the date the Domain was renewed. Domains may be deleted for credit during the 120 hours after a renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly renewed. It should be noted that domains that are deleted during the renew grace period will be placed into pendingDelete and will enter the RGP (see below).
Transfer-Delete Grace Period
The Transfer-Delete Grace Period is associated with the date the Domain was transferred to another Registrar. Domains may be deleted for credit during the 120 hours after a transfer. It should be noted that domains that are deleted during the renewal grace period will be placed into pendingDelete and will enter the RGP. A deletion of domain after a transfer is not the method used to correct a transfer mistake. Domains that have been erroneously transferred or hijacked by another party can be transferred back to the original registrar through various means including contacting the Registry.

Auto-Renew-Delete Grace Period
The Auto-Renew-Delete Grace Period is associated with the date the Domain was auto-renewed. Domains may be deleted for credit during the 120 hours after an auto-renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly auto-renewed. It should be noted that domains that are deleted during the auto-renew delete grace period will be placed into pendingDelete and will enter the RGP.

Auto-Renew Grace Period
The Auto-Renew Grace Period is a special grace period intended to provide registrants with an extra amount of time, beyond the expiration date, to renew their domain name. The grace period lasts for 45 days from the expiration date of the domain name. Registrars are not required to provide registrants with the full 45 days of the period.

Redemption Grace Period
The RGP is a special grace period that enables Registrars to restore domains that have been inadvertently deleted but are still in pendingDelete status within the Redemption Grace Period. All domains enter the RGP except those deleted during the AGP.

The RGP period is 30 days, during which time the domain may be restored using the EPP RenewDomain command as described below. Following the 30day RGP period the domain will remain in pendingDelete status for an additional five days, during which time the domain may NOT be restored. The domain is released from the SRS, at the end of the 5 day non-restore period. A restore fee applies and is detailed in the Billing Section. A renewal fee will be automatically applied for any domain past expiration.

Neustar has created a unique restoration process that uses the EPP Renew transaction to restore the domain and fulfill all the reporting obligations required under ICANN policy. The following describes the restoration process.

27.2 State Diagram
Figure 27-1 provides a description of the registration lifecycle.

The different states of the lifecycle are active, inactive, locked, pending transfer, and pending delete. Please refer to section 27.1.1 for detail description of each of these states. The lines between the states represent triggers that transition a domain from one state to another.

The details of each trigger are described below:
Create: Registry receives a create domain EPP command.
WithNS: The domain has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
WithoutNS: The domain has not met the minimum number of nameservers required by registry policy. The domain will not be in the DNS zone.
Remove Nameservers: Domain’s nameserver(s) is removed as part of an update domain EPP command. The total nameserver is below the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
Add Nameservers: Nameserver(s) has been added to domain as part of an update domain EPP command. The total number of nameservers has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
Delete: Registry receives a delete domain EPP command.
DeleteAfterGrace: Domain deletion does not fall within the add grace period.
DeleteWithinAddGrace: Domain deletion falls within add grace period.
Restore: Domain is restored. Domain goes back to its original state prior to the delete command.

Transfer: Transfer request EPP command is received.

Transfer Approve/Cancel/Reject: Transfer requested is approved or cancel or rejected.

TransferProhibited: The domain is in clientTransferProhibited and/or serverTransferProhibited status. This will cause the transfer request to fail. The domain goes back to its original state.

DeleteProhibited: The domain is in clientDeleteProhibited and/or serverDeleteProhibited status. This will cause the delete command to fail. The domain goes back to its original state.

Note: the locked state is not represented as a distinct state on the diagram as a domain may be in a locked state in combination with any of the other states: inactive, active, pending transfer, or pending delete.

27.2.1 EPP RFC Consistency

As described above, the domain lifecycle is determined by ICANN policy and the EPP RFCs. Neustar has been operating ICANN TLDs for the past 10 years consistent and compliant with all the ICANN policies and related EPP RFCs.

27.3 Resources

The registration lifecycle and associated business rules are largely determined by policy and business requirements; as such the Product Management and Policy teams will play a critical role in working with Amazon EU S.à r.l. to determine the precise rules that meet the requirements of the TLD. Implementation of the lifecycle rules will be the responsibility of Development/Engineering team, with testing performed by the Quality Assurance team. Neustar’s SRS implementation is very flexible and configurable, and in many case development is not required to support business rule changes.

As described above, the domain lifecycle is determined by ICANN policy and the EPP RFCs. Neustar has been operating ICANN TLDs for the past 10 years consistent and compliant with all the ICANN policies and related EPP RFCs.

28. Abuse Prevention and Mitigation

28.1 Abuse Prevention and Mitigation

Amazon EU S.à r.l. and its registry service provider, Neustar, recognize that preventing and mitigating abuse and malicious conduct in the .亚马逊 registry is an important and significant responsibility. Amazon EU S.à r.l. will leverage Neustar’s extensive experience in establishing and implementing registration policies to prevent and mitigate abusive and malicious domain activity within the proposed .亚马逊 space.

.亚马逊 will be a single entity registry, with all domains registered to Amazon for use in pursuit of Amazon’s business goals. There will be no re-sellers in .亚马逊 and there will be no market in .亚马逊 domains. Amazon will strictly control the use of .亚马逊 domains. Opportunities for abusive and malicious domain activity in .亚马逊 are therefore very restricted but we will nonetheless abide by our obligations to ICANN. A responsible domain name registry works towards the eradication of abusive domain name registrations and malicious activity, which may include conduct such as:

- Illegal or fraudulent actions
- Spam
- Phishing
- Pharming
- Distribution of malware
- Fast flux hosting
Botnets
Malicious hacking
Distribution of child pornography
Online sale or distribution of illegal pharmaceuticals.

By taking an active role in researching and monitoring abusive domain name registration and malicious conduct, Neustar has developed the ability to efficiently work with various law enforcement and security communities to mitigate fast flux DNS-using botnets.

Policies and Procedures to Minimize Abusive Registrations
A registry must have the policies, resources, personnel, and expertise in place to combat such abusive registration and malicious conduct. Neustar, Amazon EU S.à r.l.’s registry services provider, has played a leading role in preventing such abusive practices, and has developed and implemented a “domain takedown” policy. Amazon EU S.à r.l. also believes that combating abusive use of the DNS is important in protecting registrants.

Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution. Because removing a domain name from the zone will stop all activity associated with the domain name, including websites and e-mail, the decision to remove a domain name from the DNS must follow a documented process, culminating in a determination that the domain name to be removed poses a threat to the security and stability of the Internet or the registry. Amazon EU S.à r.l., via Neustar, has an extensive, defined, and documented process for taking the necessary action of removing a domain from the zone when its presence in the zone poses a threat to the security and stability of the infrastructure of the Internet or the registry.

Abuse Point of Contact
As required by the Registry Agreement, Amazon EU S.à r.l. will establish and publish on its website a single abuse point of contact responsible for addressing inquiries from law enforcement and the public related to malicious and abusive conduct. Amazon EU S.à r.l. will also provide such information to ICANN before delegating any domain names in .亚马逊. This information shall consist of, at a minimum, a valid e-mail address dedicated solely to the handling of malicious conduct complaints, and a telephone number and mailing address for the primary contact. Amazon EU S.à r.l. will ensure that this information is accurate and current, and that updates are provided to ICANN if and when changes are made. In addition, the registry services provider for .亚马逊, Neustar, shall continue to have an additional point of contact for requests from registrars related to abusive domain name practices.

28.2 Policies Regarding Abuse Complaints
Amazon EU S.à r.l. will adopt an Acceptable Use Policy that (i) clearly defines the types of activities that will not be permitted in .亚马逊; (ii) reserves Amazon EU S.à r.l.’s right to lock, cancel, transfer or otherwise suspend or take down domain names violating the Acceptable Use Policy; and (iii) identify the circumstances under which Amazon EU S.à r.l. may share information with law enforcement. Amazon EU S.à r.l. will incorporate its .亚马逊 Acceptable User Policy into its Registry-Registrar Agreement.

Under the .亚马逊 Acceptable Use Policy, which is set forth below, Amazon EU S.à r.l. may lock down the domain name to prevent any changes to the domain name contact and nameserver information, place the domain name “on hold” rendering the domain name non-resolvable, transfer the domain name to another registrar and/or in cases in which the domain name is associated with an ongoing law enforcement investigation, Amazon EU S.à r.l. will coordinate with law enforcement to assist in the investigation as described in more detail below.

It is Amazon EU S.à r.l.’s intention that all .亚马逊 domain names will be registered and used by it and its Affiliates and that only ICANN-accredited registrars that have signed a Registry-Registrar Agreement will be permitted to register .亚马逊 domain names. Accordingly, the potential for abusive registrations and malicious conduct in the .亚马逊 registry is expected to be limited. In the unlikely event that such abuse should occur, Amazon EU S.à r.l. will work with its registry
services provider, Neustar, to implement the following policies and processes to prevent and mitigate such activities. Below is initial Acceptable Use Policy for the .亚马逊 registry.

.亚马逊 Acceptable Use Policy

This Acceptable Use Policy gives the .亚马逊 registry the ability to quickly lock, cancel, transfer or take ownership of any .亚马逊 domain name, either temporarily or permanently, if the domain name is being used in a manner that appears to threaten the stability, integrity or security of the .亚马逊 registry, or any of its registrar partners — and/or that may put the safety and security of any registrant or user at risk. The process also allows the .亚马逊 registry to take preventive measures to avoid any such criminal or security threats.

The Acceptable Use Policy may be triggered through a variety of channels, including, among other things, private complaint, public alert, government or enforcement agency outreach, and the on-going monitoring by the .亚马逊 registry or its partners. In all cases, the .亚马逊 registry or its designees will alert .亚马逊 registry’s registrar partners about any identified threats and will work closely with them to bring offending sites into compliance.

The following are some (but not all) activities that may be subject to rapid domain compliance:

- **Phishing:** the attempt to acquire personally identifiable information by masquerading as a website other than .亚马逊’s own.
- **Pharming:** the redirection of Internet users to websites other than those the user intends to visit, usually through unauthorized changes to the Hosts file on a victim’s computer or DNS records in DNS servers.
- **Dissemination of Malware:** the intentional creation and distribution of "malicious" software designed to infiltrate a computer system without the owner’s consent, including, without limitation, computer viruses, worms, key loggers, and Trojans.
- **Fast Flux Hosting:** a technique used to shelter Phishing, Pharming and Malware sites and networks from detection and to frustrate methods employed to defend against such practices, whereby the IP address associated with fraudulent websites are changed rapidly so as to make the true location of the sites difficult to find.
- **Botnetting:** the development and use of a command, agent, motor, service, or software which is implemented: (1) to remotely control the computer or computer system of an Internet user without their knowledge or consent, (2) to generate direct denial of service (DDOS) attacks.
- **Malicious Hacking:** the attempt to gain unauthorized access (or exceed the level of authorized access) to a computer, information system, user account or profile, database, or security system.
- **Child Pornography:** the storage, publication, display and/or dissemination of pornographic materials depicting individuals under the age of majority in the relevant jurisdiction.

The .亚马逊 registry reserves the right, in its sole discretion, to take any administrative and operational actions necessary, including the use of computer forensics and information security technological services, among other things, in order to implement the Acceptable Use Policy. In addition, the .亚马逊 registry reserves the right to deny, cancel or transfer any registration or transaction, or place any domain name(s) on registry lock, hold or similar status, that it deems necessary, in its discretion (1) to protect the integrity and stability of the registry; (2) to comply with any applicable laws, government rules or requirements, requests of law enforcement, or any dispute resolution process; (3) to avoid any liability, civil or criminal, on the part of the .亚马逊 registry as well as its affiliates, subsidiaries, officers, directors, and employees; (4) per the terms of the registration agreement, or (5) to correct mistakes made by the .亚马逊 registry or any Registrar in connection with a domain name registration. The .亚马逊 registry also reserves the right to place upon registry lock, hold or similar status a domain name during resolution of a dispute.

Taking Action Against Abusive and/or Malicious Activity

The .亚马逊 registry is committed to acting in a timely manner against those domain names associated with abuse or malicious conduct in violation of the Acceptable Use
Policy. After a complaint is received from a trusted source or third-party, or detected by the .亚马逊 registry, the registry will use commercially reasonable efforts to verify the information in the complaint. If that information can be verified to the best of the registry's ability, the sponsoring registrar will be notified and have 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. If the registrar has not acted when the 12-hour period ends (i.e., is unresponsive to the request or refuses to take action), the .亚马逊 registry will place the domain on “ServerHold”.

(If it is unlikely the registrar will not timely act because Amazon EU S.à r.l. intends to use a single, gateway registrar with which it has a contract reflecting these policies). ServerHold removes the domain name from the .亚马逊 zone, but the domain name record still appears in the TLD WHOIS database so that the name and entities can be investigated by law enforcement should they desire to get involved.

Coordination with Law Enforcement
Amazon EU S.à r.l. will obtain assistance from Neustar to meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of the .亚马逊 registry. The .亚马逊 registry will respond to legitimate law enforcement inquiries promptly upon receiving the request.

The response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. for rapid resolution of the request. If the request involves any of the activities that can be validated by the registry and implicates activity covered by the .亚马逊 Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .亚马逊 Registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

Monitoring for Malicious Activity
Neustar’s registry services provider, has developed and implemented an active “domain takedown” policy in which the registry itself takes down abusive domain names.

Neustar targets domain names verified to be abusive and removes them within 12 hours regardless of whether the domain name registrar cooperated. Neustar has determined that the benefit in removing such threats outweighs any potential damage to the registrar–registrant relationship. Amazon EU S.à r.l.’s restrictions on registration eligibility make it unlikely that any .亚马逊 domains will be taken down. The .亚马逊 registry rules are anticipated to exclude third parties beyond Amazon EU S.à r.l. and its Affiliates. Moreover, only registrars that contractually agree to cooperate in stemming abusive behaviors will be permitted to register .亚马逊 domain names.

Neustar’s active prevention policies stem from the notion that registrants in .亚马逊 have a reasonable expectation that they control the data associated with their domains, especially its presence in the DNS zone. Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution that harms not only the domain name registrant, but also potentially millions of unsuspecting Internet users.

Rapid Takedown Process
Since implementing the program, Neustar has developed two basic variations of the process. The more common process variation is a lightweight process that is triggered by “typical” notices. The less common variation is the full process that is triggered by unusual notices, which generally allege that a domain name is being used to threaten the stability and security of the TLD; or is part of a real-time investigation by law enforcement or security researchers. In these cases, accelerated action by the registry is necessary. These processes are described below, though it is important to note that .亚马逊 will be managed as a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s
subsidiaries. Therefore, the potential for abusive registrations and other activities that have a negative impact on Internet users is minimal. In the unlikely event that such abuse should occur, Amazon with its registry operator, Neustar, will implement the following policies and processes to manage such activities.

**Lightweight Process**

In addition to having an active Information Security group that, on its own initiatives, seeks out abusive practices in the .亚马逊 registry, Neustar is an active member in a number of security organizations that have the expertise and experience in receiving and investigating reports of abusive DNS practices, including but not limited to, the Anti-Phishing Working Group, Castle Cops, NSP-SEC, the Registration Infrastructure Safety Group and others. Each of these sources is a well-known security organization that has a reputation for preventing abuse and malicious conduct on the Internet. Aside from these organizations, Neustar also actively participates in privately run security associations that operate based on trust and anonymity, making it much easier to obtain information regarding abusive DNS activity.

Once a complaint is received from a trusted source or third-party, or detected by Neustar’s internal security group, information about the abusive practice is forwarded to an internal mail distribution list that includes members of Neustar’s operations, legal, support, engineering, and security teams for immediate response (“CERT Team”). Although the impacted URL is included in the notification e-mail, the CERT Team is trained not to investigate the URLs themselves because the URLs in question often have scripts, bugs, etc. that can compromise the individual’s own computer and the network safety. Rather, the investigation is conducted by CERT team members who can access the URLs in a laboratory environment to avoid compromising the Neustar network. The lab environment is designed specifically for these types of tests and is scrubbed on a regular basis to ensure that none of Neustar’s internal or external network elements are harmed in any fashion.

Once the complaint has been reviewed and the alleged abusive domain name activity is verified to the best of the ability of the CERT Team, the sponsoring registrar has 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone.

The .亚马逊 Registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period. ServerHold removes the domain name from the .亚马逊 zone, but the domain name record still appears in the TLD WHOIS database so that the name and entities can be investigated by law enforcement.

**Full Process**

In the unlikely event with a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s subsidiaries, that Neustar receives a complaint that claims that a domain name is being used to threaten the stability and security of the .亚马逊 registry, or is a part of a real-time investigation by law enforcement or security, Neustar follows a slightly different course of action. Upon initiation of this process, members of the CERT Team are paged and a teleconference bridge is immediately opened up for the CERT Team to assess whether the activity warrants immediate action. If the CERT Team determines the incident is not an immediate threat to the security and the stability of critical Internet infrastructure, the CERT Team provides documentation to the Neustar Network Operations Center to clearly capture the rationale for the decision and either refers the incident to the Lightweight process set forth above or closes the incident.

However, if the CERT TEAM determines that there is a reasonable likelihood that the incident warrants immediate action, a determination is made to immediately remove the domain from the zone. As such, Customer Support will contact Amazon EU S.à r.l.’s registrar immediately to communicate that there is a domain involved in a security and stability issue. The registrar is provided only the domain name in question and the broadly stated type of incident. As .亚马逊 is a Single Entity Registry using a single registrar whose work will be strictly controlled through a Service Level Agreement that includes the implementation of measures to prevent abusive registrations, the risk of evidence of abuse being compromised is minimized.
Coordination with Law Enforcement & Industry Groups
Neustar has a close working relationship with a number of law enforcement agencies, both in the United States and Internationally. For example, in the United States, Neustar is in constant communication with the Federal Bureau of Investigation, US CERT, Homeland Security, the Food and Drug Administration, and the National Center for Missing and Exploited Children.
Neustar also participates in a number of industry groups aimed at sharing information among key industry players about the abusive registration and use of domain names. These groups include the Anti-Phishing Working Group and the Registration Infrastructure Safety Group (where Neustar served for several years on the Board of Directors). Through these organizations and others, Neustar proactively shares information with other registries, registrars, ccTLDs, law enforcement, security professionals, etc. not only on abusive domain name registrations within its own TLDs, but also with respect to information uncovered with respect to domain names in other registries’ TLDs. Neustar has often found that rarely are abuses found only in the TLDs for which it manages, but also within other TLDs, such as .com and .info. Neustar routinely provides this information to the other registries so that the relevant registry can take the appropriate action.
With the assistance of Neustar as its registry services provider, Amazon EU S.à r.l. can meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of its .亚马逊 registry. Amazon EU S.à r.l. and/or Neustar will respond to legitimate law enforcement inquiries promptly upon receiving the request. Such response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. and/or Neustar for rapid resolution of the request.
If the request involves any of the activities that can be validated by the registry and/or Neustar and implicates the type of activity set forth in the Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the activity further and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .亚马逊 registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

28.3 Measures for Removal of Orphan Glue Records
As the Security and Stability Advisory Committee of ICANN (SSAC) rightly acknowledges, although orphaned glue records may be used for abusive or malicious purposes, the “dominant use of orphaned glue supports the correct and ordinary operation of the DNS.” See http://www.icann.org/en/committees/security/sac048.pdf.
While orphan glue often support correct and ordinary operation of the DNS, such glue records can be used maliciously to point to name servers that host domains used in illegal phishing, bot-nets, malware, and other abusive behaviors. Problems occur when the parent domain of the glue record is deleted but its children glue records still remain in DNS. Therefore, when the .亚马逊 registry has written evidence of actual abuse of orphaned glue, the .亚马逊 registry will act to remove those records from the zone to mitigate such malicious conduct.

Neustar runs a daily audit of entries in its DNS systems and compares those with its provisioning system, which serves as an umbrella protection that items in the DNS zone are valid. Any DNS record that shows up in the DNS zone but not in the provisioning system is flagged for investigation and removed if necessary. This daily DNS audit prevents not only orphaned hosts but also other records that should not be in the zone.
In addition, if either Amazon EU S.à r.l. or Neustar becomes aware of actual abuse on orphaned glue after receiving written notification from a third party through its Abuse Contact or through its customer support, such glue records will be removed from the zone.

28.4 Measures to Promote WHOIS Accuracy
The .亚马逊 registry will implement several measures to promote Whois accuracy. Whois service for Amazon EU S.à r.l. will operate as follows. The registry will keep all basic contact details for each domain name in a unique internal system, which
facilitates access to the domain information. In addition, Amazon EU S.à r.l. will perform internal monitoring checks and procedures that will only allow accurate Whois information and remove outdated data.

28.4.1. Authentication of Registrant Information
Amazon EU S.à r.l. will guarantee the adequate authentication of registrant data, ensuring the highest levels of accuracy and diligence when dealing with Whois data. In doing so, Amazon EU S.à r.l.’s solid internal system will undertake, but not be limited to the following measures: running checks against Whois internal records and regular verification of all contact details and other relevant registrant information. The Amazon EU S.à r.l.’s registrar will also be charged with regularly checking Whois accuracy.

Amazon EU S.à r.l. will have a well-defined registration policy that will include a requirement that complete and accurate registrant details are provided by the requestor for a domain. These details will be validated by the Amazon EU S.à r.l. registrar who will have a contractual duty to comply with Amazon EU S.à r.l.’s registration policy. The full details of every domain requestor will be kept in Amazon EU S.à r.l.’s on-line registry management dashboard which can be accessed by Amazon EU S.à r.l.’s Domain Management Team at any time.

28.4.2. Regular Monitoring of Registration Data
Amazon EU S.à r.l. will comply with ICANN’s Whois requirements. Among other measures, Amazon EU S.à r.l. will regularly remind its internal personnel to comply with ICANN’s Whois information Policy through regularly checking Whois data against internal records, offering Whois accuracy services, evaluating claims of fraudulent Whois data, and cancelling domain name registrations with outdated Whois details.

28.4.3. Policies and Procedures ensuring compliance
Only Amazon EU S.à r.l. and its Affiliates will be permitted to register and use Amazon EU S.à r.l. domain names. Accordingly, the duties of the Amazon EU S.à r.l. registrar will be very limited and closely defined. Regardless, Amazon EU S.à r.l.’s Registry-Registrar Agreement will require Amazon EU S.à r.l.’s registrar to take steps necessary to ensure Whois data is complete and accurate and to implement the .亚马逊 registration policies.

28.5 Resourcing Plans
Responsibility for abuse mitigation rests with a variety of functional groups at Neustar. The Neustar Abuse Monitoring team is primarily responsible for providing analysis and conducting investigations of reports of abuse. The Neustar Customer Service team also plays an important role in assisting with investigations, responding to customers, and notifying registrars of abusive domains. Finally, the Neustar Policy-Legal team is responsible for developing the relevant policies and procedures.

The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Customer Support – 12 employees
Policy-Legal – Two employees

The resources are more than adequate to support the abuse mitigation procedures of the .亚马逊 registry.

Furthermore, Amazon EU S.à r.l. dedicates significant financial and personnel resources to combating malicious and abusive behavior in the DNS and across the internet. Amazon EU S.à r.l. will extend these resources to designating the unique abuse point of contact, regularly monitoring potential abusive and malicious activities with support from dedicated technical staff, analyzing reported abuse and malicious activity, and acting to address such reported activity. The designated abuse prevention staff within Neustar and Amazon EU S.à r.l. will be subject to regular evaluations, receive adequate training and work under expert supervision. The abuse prevention resources will comprise both internal staff and external abuse prevention experts who would give extra advice and support when necessary. This external staff includes experts in Amazon EU S.à r.l.’s registrar
where one legal manager and four operational experts will be available to support Amazon EU S.à r.l.

Please note that in the above answer the terms “We”, “Our” and “Amazon” may refer to either the applicant Amazon EU S.à r.l. or Amazon.com Inc., the ultimate parent, or sometimes NeuStar, the registry services provider.

29. Rights Protection Mechanisms

29.1 Introduction

Amazon is applying for .亚马逊 to provide a dedicated platform for stable and secure online communication and interaction. Amazon has several thousand registered intellectual property assets of all types including trademarks, designs, and domain names - we place the protection of our intellectual property as a high priority and we respect the intellectual property of others.

29.1.1 Rights protection in gTLD registry operation is a core objective of Amazon. We will closely manage this TLD by registering domains through a single registrar. Although Amazon and its subsidiaries will be the only eligible registrants, we will nonetheless require our registrar to work with us on a four-step registration process featuring: (i) Eligibility Confirmation; (ii) Naming Convention Check; (iii) Acceptable Use Review; and (iv) Registration. As stated in our answer to Question 18, all domains in our registry will remain the property of Amazon and will be provisioned to support the business goals of Amazon. Because all domains will be registered and maintained by Amazon (for use that complements our strategic business goals), we can ensure that all domains in our registries will carry accurate and up-to-date registration records.

We believe that the above registration process will ensure that abusive registrations are prevented, but we will continue to monitor ICANN policy developments, and update our procedures as required.

29.2 Core measures to prevent abusive registrations

To further prevent abusive registration or cybersquatting, we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated for new gTLD operators by ICANN:

- A 30 day Sunrise process
- A 60 day Trademark Claims process

Generally, these RPMs are targeted at abusive registrations undertaken by third parties. However, domains in our registry will be registered only to Amazon or its subsidiaries through a single registrar who will be contractually required to ensure that stated rules covering eligibility and use of a domain are adhered to through a validation process. As a result, abusive registrations should be prevented.

In the very unlikely circumstances that a domain is registered and used in an improper way, we acknowledge that we will be the respondent in related proceedings and we undertake to co-operate fully with ICANN and other appropriate agencies to resolve any concerns.

29.2.1 Sunrise Eligibility

Our Sunrise Eligibility Requirements will clearly state that eligible applicants must be members of the Amazon group of companies and its subsidiaries. Furthermore, all domain names must be used to support the business goals of Amazon. Nonetheless, notice of our Sunrise will be provided to third party holders of validated trademarks in the Trademark Clearinghouse as required by ICANN. Our Sunrise Eligibility Requirements will be published on the website of our registry.

29.2.2 Sunrise Window

As required in the Applicant Guidebook in section 7.1, our Sunrise window will recognize "all word marks: (i) nationally or regionally registered and for which proof of use - which can be a declaration and a single specimen of current use - was submitted to, and validated by, the Trademark
Clearinghouse; or (ii) that have been court-validated; or (iii) that are specifically protected by a statute or treaty currently in effect and that was in effect on or before 26 June 2008”.

Our Sunrise window will last for 30 days. Applications received from an ICANN-accredited registrar will be accepted for registration if they are (i) supported by an entry in the Trademark Clearinghouse (TMCH) during our Sunrise window and (ii) satisfy our Sunrise Eligibility Requirements. Once registered, those domain names will have a one year term of registration. Any domain names registered will be managed by our registrar.

29.2.3 Sunrise Dispute Resolution Policy
We will devise and publish the rules for our Sunrise Dispute Resolution Policy (SDRP) on our registry website. Our SDRP will apply to all our registries and will allow any party to raise a challenge on the following four grounds as required in the Applicant Guidebook (6.2.4):

(i) At the time the challenged domain name was registered, the registrant did not hold a trademark registration of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty;
(ii) The domain name is not identical to the mark on which the registrant based its Sunrise registration;
(iii) The trademark registration on which the registrant based its Sunrise registration is not of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty; or
(iv) The trademark registration on which the domain name registrant based its Sunrise registration did not issue on or before the effective date of the Registry Agreement and was not applied for on or before ICANN announced the applications received.

Complaints can be submitted through our registry website within 30 days following the closure of the Sunrise, and will be initially processed by our registrar. Our registrar will promptly report to us: (i) the challenger; (ii) the challenged domain name; (iii) the grounds upon which the complaint is based; and (iv) why the challenger believes the grounds are satisfied.

29.2.4 Trademark Claims Service
Our Trademark Claims Service (TMCS) will run for a 60 day period following the closure of our 30 day Sunrise. Our TMCS will be supported by the Trademark Clearinghouse and will provide a notice to third parties interested in filing a character string in our registry of a registered trademark right that matches the character string in the TMCH.

We will honour and recognize in our TMCS the following types of marks as defined in the Applicant Guidebook section 7.1: (i) nationally or regionally registered; (ii) court-validated; or (iii) specifically protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion.

Once received from the TMCH, with which our registry provider will interface, a claim will be initially processed by our registrar who will provide a report to us on the eligibility of the applicant.

29.2.5 Implementation and Resourcing Plans of core services to prevent abusive registration
Our Sunrise and IP Claims service will be introduced with the following timetable:
Day One: Announcement of Registry Launch and publication of registry website with details of the Sunrise and Trademark Claim Service (“TMCS”)
Day 30: Sunrise opens for 30 days on a first-come, first served basis. Once registrations are approved, they will be entered into the Shared Registry System (SRS) and published in our Thick-Whois database.
Day 60-75: Registry Open, domains applied for in the Sunrise registered and TMCS begins for a minimum of 60 days
Day 120-135: TMCS ends; normal operations continue.
Our Implementation Team will comprise the following: From Amazon: the Director of IP will lead a team of up to seven experts with experience of domain name management and on-line legal dispute resolution, with access to other teams in Amazon Legal if required.
From NeuStar, registry service provider to Amazon: A Customer Support team of 12, a Product Management Team of four and a Development/Engineering Team of 19 will be available as required to support the legal team, led by Jeff Neuman. This team has over 10 years’ experience with implementing registry launches including rights protection schemes such as the .biz Sunrise and IP Claims. In addition, Amazon will be supported by its Registrar which will provide two legal specialists, four client managers and six operational staff. The operational staff will undertake the validation checks on registration requests.

The Implementation Team will create a formal Registry Launch plan by 1 October 2012. This plan will set out the exact process for the launch of each Amazon registry and will define responsibilities and budgets. The Registry website, which is budgeted for in the three year plans provided in our answers to Question 46, will be built by 1 December 2012 or within 30 days of pre-validation testing beginning, whichever is the sooner. It will feature Rules of Registration, Rules of Eligibility, Terms & Conditions of Registration, Acceptable Use Policies as well as the Rules of the Sunrise, the Rules of the Sunrise Dispute Resolution Policy and the Rules of the Trademark Claims Service.

Technical implementation between the registry and the Trademark Clearinghouse will be undertaken by the registry service provider as soon as practical after the Trademark Clearinghouse is operational and announces its integration process. As demonstrated in our answer to question 46, a budget has been set aside to pay fees charged by the Trademark Clearinghouse Operator for this integration.

The contract we have with our registrar (the RAA) will require that the registrar uses the TMCH, adheres to the Terms & Conditions of the TMCH and will prohibit the registrar from filing domains in our registries on its own behalf or utilizing any data from the TMCH except in the provision of its duties as our registrar.

When processing TMCS claims, our registrar will be required to use the specific form of notice provided by ICANN in the Applicant Guidebook. We will also require our registrar to implement appropriate privacy policies reflecting local requirements. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.

29.3 Mechanisms to identify and address the abusive use of registered domain names on an ongoing basis

To prevent the abusive use of registered domain names on an ongoing basis we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated by ICANN:

- The Uniform Dispute Resolution Policy (UDRP) to address domain names that have been registered and used in bad faith in the TLD.
- The Uniform Rapid Suspension (URS) scheme which is a faster, more efficient alternative to the Uniform Dispute Resolution Policy to deal with clear-cut cases of cybersquatting.
- The Post Delegation Dispute Resolution Procedure (PDDRP).
- Implementation of a Thick WHOIS making it easier for rights holders to identify and locate infringing parties.

The UDRP and the URS are targeted at abusive registrations undertaken by third parties and the PDDRP at so called “Bad Actor” registries. As domains in our registry will be registered not to third parties but only to Amazon or its subsidiaries through a single registrar which will be required through contract to ensure that the rules covering eligibility and use of a domain are adhered to, we believe that abusive registrations by third parties should be completely prevented. Abusive behaviour by representatives of Amazon or our subsidiaries will be prevented by our internal processes, for example the pre-registration validation checks and monitoring of use of our registrar.

We acknowledge that we are subject to the UDRP, the URS and the PDDRP and we will co-operate fully with ICANN and appropriate registries in the unlikely circumstances that complaints against us, as the registrant, are made.

29.3.1 The Uniform Dispute Resolution Policy (UDRP)

The UDRP is an out-of-court dispute resolution mechanism for trademark owners to resolve clear cases of bad faith, abusive registration and use of domain names. The UDRP applies by contract to all domain name registrations in gTLDs. Standing to file a UDRP complaint is limited to trademark owners who must demonstrate their
To prevail in a UDRP complaint, the complainant must further demonstrate that the domain name registrant has no rights or legitimate interests in the disputed domain name, and that the disputed domain name has been registered and is being used in bad faith. In the event of a successful claim, the infringing domain name registration is transferred to the complainant’s control.

Amazon or its subsidiaries will be the respondent in all UDRP complaints because we will be the only eligible registrants. Therefore we do not anticipate that there are any circumstances in which complainants can argue that we have “no rights or legitimate interests” in a domain in our registry so the possibility of good faith UDRP complaints should be minimized. In the unlikely circumstances that a complaint is made, we will respond in a timely fashion, reflecting our contractual responsibility to ICANN as a registry operator.

We will be applying for an exemption to Clause 1b of the Registry Operators Code of Conduct. This means that we will not be allowed to transfer domains to third parties as the only registrant will be Amazon or our subsidiaries. Therefore if a complaint against us is filed, the only possible remedy will be the cancellation of the domain instead of the transfer to the complainant.

Should a successful complaint be made we will therefore place the cancelled domain on a list that prevents it from being registered again.

29.3.2 The URS

The URS is intended to be a lighter, quicker complement to the UDRP. Like the UDRP, it is intended for clear-cut cases of trademark abuse. Under the URS, the only remedy which a panel may grant is the temporary suspension of a domain name for the duration of the registration period (which may be extended by the prevailing complainant for one year, at commercial rates). URS substantive criteria mirror those of the UDRP but with a higher burden of proof for complainants, and additional registrant defences. Once a determination is rendered, a losing registrant has several appeal possibilities from 30 days up to one year. Either party may file a de novo appeal within 14 days of a decision. There are penalties for filing “abusive complaints” which may result in a ban on future URS filings.

As with the description of our UDRP process above, Amazon or its subsidiaries will be the respondent in all URS complaints because we will be the only eligible registrants. Therefore we do not anticipate that there are any circumstances in which complainants can argue that we have “no legitimate right or interest to the domain name” and “that the domain name was registered and is being used in bad faith.” Notwithstanding this, should a complaint be made, we will respond in a timely fashion, reflecting our contractual responsibility to ICANN as a registry operator.

Should a successful complaint be made, we will suspend the domain name for the duration of the registration period.

We will co-operate with the URS panel providers and panelists as we will co-operate with UDRP panel providers and panelists. Being the only eligible registrant, we will not make changes to a domain in Locked Status or alter a registration record associated with a URS complaint as required in the Applicant Guidebook.

29.3.3 The Post-Delegation Dispute Resolution Procedure (PDDRP)

The PDDRP is an administrative option for trademark owners to file an objection against a registry whose “affirmative conduct” in its operation or use of its gTLD is alleged to cause or materially contribute to trademark abuse. In this way, the PDDRP is intended to act as a higher-level enforcement tool to assist ICANN compliance activities, where rights holders may not be able to continue to turn solely to lower-level multijurisdictional enforcement options in a vastly expanded DNS.

The PDDRP involves a number of procedural layers, such as an administrative compliance review, appointment of a “threshold review panel”, an expert determination as to liability under the procedure (with implementation of any remedies at ICANN’s discretion), a possible de novo appeal and further appeal to arbitration under ICANN’s registry terms. The PDDRP requires specific bad faith conduct including profit from encouraging infringement in addition to “the typical registration fee.”

As set out in the Applicant Guidebook in the appendix summarising the PDDRP, the
grounds for a complaint on a second level registration are that, “(a) there is a
substantial pattern or practice of specific bad faith intent by the registry
operator to profit from the sale of trademark infringing domain names; and (b) the
registry operator’s bad faith intent to profit from the systematic registration of
domain names within the gTLD that are identical or confusingly similar to the
complainant’s mark, which (i) takes unfair advantage of the distinctive character or
the reputation of the complainant’s mark or (ii) impairs the distinctive character
or the reputation of the complainant’s mark, or (iii) creates a likelihood of
confusion with the complainant’s mark.”

Whilst we will co-operate with any complaints made under the PDDRP and we will abide
by any determinations, we think it is highly improbable that any PDDRP complaints
will succeed because the grounds set out above cannot be satisfied as domains in the
registry will not be for sale and cannot be transferred to third parties.

29.3.4 Thick Whois

As required in Specification 4 of the Registry agreement, all Amazon registries will
provide Thick Whois. A Thick WHOIS provides a centralized location of registrant
information within the control of the registry (as opposed to thin WHOIS where the
data is dispersed across registrars).

Thick Whois will provide rights owners and law enforcement with the ability to
review the registration record easily.

We will place a requirement on our registrar to ensure that all registrations are
filed with accurate Whois details and we will undertake reviews of Whois accuracy
every three months to ensure that the integrity of data under our control is
maintained.

Amazon will create and publish a Whois Query email address so that third parties can
submit queries about any domains in our registry.

29.3.5 Implementation and Resourcing Plans for mechanisms to identify and address
the abusive use of registered domain names on an ongoing basis

Our post-launch rights protection mechanisms will be in place from Day One of the
launch of the registry.

To ensure that we are compliant with our obligations as a registry operator, we will
develop a section of our registry website to assist third parties involved in UDRP,
URS and PDDRP complaints including third parties wishing to make a complaint, ICANN
compliance staff and the providers of UDRP and URS panels. This will feature an
email address for enquiries relating to disputes or seeking further information on
specific domain names. We will monitor this address for all of the following: Notice of
Complaint, Notice of Default, URS Determination, UDRP Determination, Notice of
Appeal and Appeal Panel Findings where appropriate.

As stated in our answer to Question 18, Amazon’s Intellectual Property group will be
responsible for the development, maintenance and enforcement of the Domain
Management Policy. This will include ensuring that the following implementation
targets are met:

• Locking domains that are the subject of URS complaints within 24 hours of
  receipt of a URS complaint, and ensuring our registrar locks domains that are the
  subject of UDRP complaints within 24 hours of receipt of a UDRP complaint.
• Confirming the implementation of the lock to the relevant URS provider, and
  ensure our registrar confirms the implementation of the lock to the relevant UDRP
  provider.
• Ensuring that our registrar cancels domain names that are the subject of a
  successful UDRP complaint within 24 hours
• Redirecting servers to a website with the ICANN mandated information
  following a successful URS within 24 hours

The human resources dedicated to managing post-launch RPM include:

From Amazon: the Director of IP will lead a team of up to seven experts with
experience of domain name management and on-line legal dispute resolution, with
access to other teams in Amazon Legal if required.

From NeuStar, registry service provider to Amazon: A Customer Support team of 12, a
Product Management Team of four and a Development/Engineering Team of 19 will be
available as required to support the legal team, led by Jeff Neuman. This team has
over 10 years’ experience with implementing registry launches including rights
protection schemes including the .biz Sunrise and IP Claims.

In addition, Amazon will be supported by its Registrar which will provide two legal
specialists, four client managers and six operational staff. The operational staff will undertake the validation checks on registration requests. We are confident that this staffing is more than adequate for a registry where the only registrant is Amazon or its subsidiaries. Of course, should business goals change requiring more resources, Amazon will closely review any expansion plans, and plan for additional financial, technical, and team-member support to put the Registry in the best position for success. We will also require our registrar to implement appropriate privacy policies reflecting the high standards that we operate. For information on our Privacy Policies, please see: http://www.amazon.com/gp/help/customer/display.html/ref=footer_privacy?ie=UTF8&nodeId=468496

29.4 Additional Mechanism that exceed requirements

Rights protection is at the core of Amazon’s objective in applying for this registry. Therefore we are committed to providing the following additional mechanisms:

29.4.1 Registry Legal Manager

Amazon will appoint a Legal Manager to ensure that we are compliant with ICANN policies. The Legal Manager will also handle all disputes relating to RPMs. This will involve evaluating complaints, working with external legal counsel and law enforcement, and resolving disputes. The Legal Manager will also liaise with external stakeholders including URS and UDRP panel providers, the TMCH operator and trademark holders as needed.

29.4.2 Rights Protection Help Line

Amazon will maintain a Rights Protection Help Line. Calls to this line will be allocated a Case Number and the following details will be recorded: (i) the contact details of the complainant; (ii) the domain name that is the subject of the complaint or query; (iii) the registered right, if any, that is associated with the request; and (iv) an explanation of the concerns.

An initial response to a query or complaint will be made within 24 hours. The Rights Protection Help Line will be in place on Day One of the registry. The cost of the Rights Help Line is reflected in the Projections Templates provided at Question 46 as part of on-going registry maintenance costs.

The aim of the Rights Protection Help Line is to assist third parties in understanding the mission and purpose of our registry and to see if a resolution can be found that is quicker and easier than the filing of a UDRP or URS complaint. The Legal Manager will oversee the Rights Protection Help Line.

29.4.3 Registrar Accreditation

Amazon will audit the performance of our registrar every six months and re-validate our Registry-Registrar Agreements annually. Our audits will include site visits to ensure the security of data etc.

29.4.4 Audits of registration records

Every three months, whichever is the most of 250 or 2% of the total of domain names registered in that period will be reviewed by our registrar to ensure accurate registration records and use that is compliant with our Acceptable Use guidelines.

Amazon will create a website for all our registries and we will make it easy for third parties including representatives of law enforcement to contact us by featuring our full contact details (physical, email address and phone number).

29.4.6 Click Wrapping our Terms & Conditions

Although only Amazon and its subsidiaries can register domain names in our registry, we will bring to the attention of requestors of domain names the Terms & Conditions of registration and, especially, Acceptable Use terms through Click Wrapping.

29.4.7 Annual Report

Amazon will publish an Annual Report on Rights Protection in our registries on our Registry Website. This will include relevant statistics and it will outline all cases and how they were resolved.

29.4.8 Contacts with WIPO and other DRS providers

Amazon will invite representatives of WIPO and other DRS providers to review our RPM and to make suggestions on any improvements that we might make after the first full year of operation.

29.4.9 Registrant Pre-Verification
All requests for registration will be verified by our registrar to ensure that they come from a legitimate representative of Amazon or our subsidiaries. A record of the request will be kept in our on-line domain management console including the requestor’s email address and other contact information.

29.4.10 Take down Procedures
Amazon has described Takedown Procedures for domains supporting Abusive Behaviours in Question 28. We think this is very unlikely in a registry where only Amazon or its subsidiaries are registrants but we will reserve the right to terminate a registration and to take down all associated services after a review by our Legal Manager if a takedown for reasons of rights protection is requested by law enforcement, a representative of a court we recognise etc.

29.4.11 Speed of Response
Wherever possible, as outlined above, Amazon committed to a response within 24 hours of a complaint being made. This exceeds the guidelines for the UDRP and the URS. Please note that in the above answer the terms “We”, “Our” and “Amazon” may refer to either the applicant Amazon EU S.à r.l. or Amazon.com Inc., the ultimate parent.

30(a). Security Policy: Summary of the security policy for the proposed registry

Amazon EU S.à r.l. and our back-end operator, Neustar, recognize the vital need to secure the systems and the integrity of the data in commercial solutions. The .亚马逊 registry solution will leverage industry-best security practices including the consideration of physical, network, server, and application elements. Neustar’s approach to information security starts with comprehensive information security policies. These are based on the industry best practices for security including SANS (SysAdmin, Audit, Network, Security) Institute, NIST (National Institute of Standards and Technology), and Center for Internet Security (CIS). Policies are reviewed annually by Neustar’s information security team. The following is a summary of the security policies that will be used in the .亚马逊 registry, including:
1. Summary of the security policies used in the registry operations
2. Description of independent security assessments
3. Description of security features that are appropriate for .亚马逊
4. List of commitments made to registrants regarding security levels

All of the security policies and levels described in this section are appropriate for the .亚马逊 registry.

30.(a).1 Summary of Security Policies

Neustar, Inc. has developed a comprehensive Information Security Program in order to create effective administrative, technical, and physical safeguards for the protection of its information assets, and to comply with Neustar’s obligations under applicable law, regulations, and contracts. This Program establishes Neustar’s policies for accessing, collecting, storing, using, transmitting, and protecting electronic, paper, and other records containing sensitive information. The Program defines:
- The policies for internal users and our clients to ensure the safe, organized and fair use of information resources.
- The rights that can be expected with that use.
- The standards that must be met to effectively comply with policy.
- The responsibilities of the owners, maintainers, and users of Neustar’s information resources.

Rules and principles used at Neustar to approach information security issues

The following policies are included in the Program:
1. **Acceptable Use Policy**
   The Acceptable Use Policy provides the “rules of behavior” covering all Neustar Associates for using Neustar resources or accessing sensitive information.

2. **Information Risk Management Policy**
   The Information Risk Management Policy describes the requirements for the on-going information security risk management program, including defining roles and responsibilities for conducting and evaluating risk assessments, assessments of technologies used to provide information security and monitoring procedures used to measure policy compliance.

3. **Data Protection Policy**
   The Data Protection Policy provides the requirements for creating, storing, transmitting, disclosing, and disposing of sensitive information, including data classification and labeling requirements, the requirements for data retention. Encryption and related technologies such as digital certificates are also covered under this policy.

4. **Third Party Policy**
   The Third Party Policy provides the requirements for handling service provider contracts, including specifically the vetting process, required contract reviews, and on-going monitoring of service providers for policy compliance.

5. **Security Awareness and Training Policy**
   The Security Awareness and Training Policy provide the requirements for managing the on-going awareness and training program at Neustar. This includes awareness and training activities provided to all Neustar Associates.

6. **Incident Response Policy**
   The Incident Response Policy provides the requirements for reacting to reports of potential security policy violations. This policy defines the necessary steps for identifying and reporting security incidents, remediation of problems, and conducting “lessons learned” post-mortem reviews in order to provide feedback on the effectiveness of this Program. Additionally, this policy contains the requirement for reporting data security breaches to the appropriate authorities and to the public, as required by law, contractual requirements, or regulatory bodies.

7. **Physical and Environmental Controls Policy**
   The Physical and Environmental Controls Policy provides the requirements for securely storing sensitive information and the supporting information technology equipment and infrastructure. This policy includes details on the storage of paper records as well as access to computer systems and equipment locations by authorized personnel and visitors.

8. **Privacy Policy**
   Neustar supports the right to privacy, including the rights of individuals to control the dissemination and use of personal data that describes them, their personal choices, or life experiences. Neustar supports domestic and international laws and regulations that seek to protect the privacy rights of such individuals.

9. **Identity and Access Management Policy**
   The Identity and Access Management Policy covers user accounts (login ID naming convention, assignment, authoritative source) as well as ID lifecycle (request, approval, creation, suspension, deletion, review), including provisions for system/application accounts, shared/group accounts, guest/public accounts, temporary/emergency accounts, administrative access, and remote access. This policy also includes the user password policy requirements.

10. **Network Security Policy**
    The Network Security Policy covers aspects of Neustar network infrastructure and the technical controls in place to prevent and detect security policy violations.

11. **Platform Security Policy**
    The Platform Security Policy covers the requirements for configuration management of servers, shared systems, applications, databases, middleware, and desktops and laptops owned or operated by Neustar Associates.

12. **Mobile Device Security Policy**
    The Mobile Device Policy covers the requirements specific to mobile devices with information storage or processing capabilities. This policy includes laptop standards, as well as requirements for PDAs, mobile phones, digital cameras and music players, and any other removable device capable of transmitting, processing or storing information.
13. Vulnerability and Threat Management Policy
The Vulnerability and Threat Management Policy provides the requirements for patch management, vulnerability scanning, penetration testing, threat management (modeling and monitoring) and the appropriate ties to the Risk Management Policy.

14. Monitoring and Audit Policy
The Monitoring and Audit Policy covers the details regarding which types of computer events to record, how to maintain the logs, and the roles and responsibilities for how to review, monitor, and respond to log information. This policy also includes the requirements for backup, archival, reporting, forensics use, and retention of audit logs.

15. Project and System Development and Maintenance Policy
The System Development and Maintenance Policy covers the minimum security requirements for all software, application, and system development performed by or on behalf of Neustar and the minimum security requirements for maintaining information systems.

30. (a).2 Independent Assessment Reports
Neustar IT Operations is subject to yearly Sarbanes-Oxley (SOX), Statement on Auditing Standards #70 (SAS70) and ISO audits. Testing of controls implemented by Neustar management in the areas of access to programs and data, change management and IT Operations are subject to testing by both internal and external SOX and SAS70 audit groups. Audit Findings are communicated to process owners, Quality Management Group and Executive Management. Actions are taken to make process adjustments where required and remediation of issues is monitored by internal audit and QM groups. As authorized by Neustar, the third party performs an external Penetration Test to review potential security weaknesses of network devices and hosts and demonstrate the impact to the environment. The assessment is conducted remotely from the Internet with testing divided into four phases:

A network survey is performed in order to gain a better knowledge of the network that was being tested
Vulnerability scanning is initiated with all the hosts that are discovered in the previous phase
Identification of key systems for further exploitation is conducted
Exploitation of the identified systems is attempted.

Each phase of the audit is supported by detailed documentation of audit procedures and results. Identified vulnerabilities are classified as high, medium and low risk to facilitate management’s prioritization of remediation efforts. Tactical and strategic recommendations are provided to management supported by reference to industry best practices.

30. (a).3 Augmented Security Levels and Capabilities
There are no increased security levels specific for .亚马逊. However, Neustar will provide the same high level of security provided across all of the registries it manages.
A key to Neustar’s Operational success is Neustar’s highly structured operations practices. The standards and governance of these processes:
- Include annual independent review of information security practices
- Include annual external penetration tests by a third party
- Conform to the ISO 9001 standard (Part of Neustar’s ISO-based Quality Management System)
- Are aligned to Information Technology Infrastructure Library (ITIL) and CoBIT best practices
- Are aligned with all aspects of ISO IEC 17799
- Are in compliance with Sarbanes-Oxley (SOX) requirements (audited annually)
- Are focused on continuous process improvement (metrics driven with product scorecards reviewed monthly).

A summary view to Neustar’s security policy in alignment with ISO 17799 can be found in section 30. (a).4 below.

30. (a).4 Commitments and Security Levels
The .亚马逊 registry commits to high security levels that are consistent with the needs of the TLD. These commitments include:
Compliance with High Security Standards
  Security procedures and practices that are in alignment with ISO 17799
  Annual SOC 2 Audits on all critical registry systems
  Annual 3rd Party Penetration Tests
  Annual Sarbanes Oxley Audits

Highly Developed and Document Security Policies
  Compliance with all provisions described in section 30.(a).4 below and in the attached security policy document.
  Resources necessary for providing information security
  Fully documented security policies
  Annual security training for all operations personnel

High Levels of Registry Security
  Multiple redundant data centers
  High Availability Design
  Architecture that includes multiple layers of security
  Diversified firewall and networking hardware vendors
  Multi-factor authentication for accessing registry systems
  Physical security access controls
  A 24x7 manned Network Operations Center that monitors all systems and applications
  A 24x7 manned Security Operations Center that monitors and mitigates DDoS attacks
  DDoS mitigation using traffic scrubbing technologies
New gTLD Application Submitted to ICANN by: Amazon EU S.à r.l.

14(a). If an IDN, provide the A-label (beginning with "xn--").

xn--cckwcxetd

14(b). If an IDN, provide the meaning or restatement of the string in English, that is, a description of the literal meaning of the string in the opinion of the applicant.

Amazon

14(c). If an IDN, provide the language of the label (in English).

Japanese

14(c). If an IDN, provide the language of the label (as referenced by ISO-639-1).

JA
14(d). If an IDN, provide the script of the label (in English).

Katakana

14(d). If an IDN, provide the script of the label (as referenced by ISO 15924).

KANA

14(e). If an IDN, list all code points contained in the U-label according to Unicode form.

U+30A2 U+30DE
U+30BE U+30F3

15(a). If an IDN, Attach IDN Tables for the proposed registry.

Attachments are not displayed on this form.

15(b). Describe the process used for development of the IDN tables submitted, including consultations and sources used.

Wherever possible, well-established language tables that have been published in IANA Repository of IDN Practices are adopted. Published tables, especially from a ccTLD that primarily uses the given language or script, represent valuable research and deployment experience. In the interest of interoperability, we reuse these tables in our IDN implementation.

In some instances, multiple language tables for the same language may exist, with material differences in their content. In order to determine the best approach that fits our needs and specific target audience, we may conduct research and consult reference sources such as omniglot.com and evertype.com for clarity and understand the reason for the differences.

The Japanese IDN table is based on the .biz table found on in the IANA Repository. This table has been in use for nearly five years. When it was created in 2007, it was derived from the following sources:
IDN Character Table for JPRS: http://www.iana.org/assignments/idn/jp-japanese.html

When constructing the table, Neustar consulted with various experts including representatives at JPRS.

15(c). List any variant strings to the applied-for gTLD string according to
the relevant IDN tables.

N/A

16. Describe the applicant's efforts to ensure that there are no known operational or rendering problems concerning the applied-for gTLD string. If such issues are known, describe steps that will be taken to mitigate these issues in software and other applications.

Amazon EU S.à r.l. (AEU) foresees no known rendering issues in connection with the .アマゾン TLD. This is based upon consultation with AEU's backend provider, Neustar, which has successfully launched a number of new gTLDs over the last decade. In reaching this determination, the following data points were analyzed:

- ICANN's Security Stability Advisory Committee DSV009, Alternative TLD Name Systems and Roots: Conflict, Control & Consequences
- IAB - RFC3696 Application Techniques for Checking & Transformation of Names
- Known software issues which Neustar has encountered from launching new gTLDs
- Character type and length
- ICANN supplemental notes to Q16
- ICANN presentation during its Costa Rica regional meeting on TLD Universal Acceptance;

The following sections discuss the potential operational or rendering problems that can arise, and how mitigated.

Compliance & Interoperability
The applied-for string conforms to all relevant RFCs, as well as the string requirements set forth in s2.2.1.3.2 Applicant Guidebook.

Mixing Scripts
A domain name label with characters from different scripts has a higher likelihood of encountering rendering issues. If the mixing of scripts occurs within the top-level label, any rendering issue would affect all domain names registered under it. If occurring within second level labels, its ill-effects are confined to the domain names with such labels. All characters in the applied-for gTLD string are taken from a single script. The IDN policies are conservative and compliant with ICANN Guidelines for the Implementation of IDN V3.0. Specifically, mixed-script labels may not be registered at the 2nd level, except for languages with established orthographies and conventions that require the commingled use of multiple scripts, e.g. Japanese.

Interaction between Labels
Even with the above issue appropriately restricted, it is possible that a domain name composed of labels with different properties such as script and directionality may introduce unintended rendering behavior.
Only scripts and characters that would not pose a risk when combined with the top level label will be offered.

Immature Scripts
Scripts or characters added in Unicode versions newer than 3.2 (on which IDNA2003 was based) may encounter interoperability issues due to the lack of software support.
We have no current plans to offer registration of labels containing such scripts or characters.

Other Issues
We are not offering the registration of domains that includes combining characters or characters that require IDNA contextual rules handling.
The following may be construed as operational or rendering issues, but consider them out of the scope of this question. Nevertheless, we will take reasonable steps to protect registrants and Internet users by working with vendors and relevant language communities to mitigate such issues.

- missing fonts causing string to fail to render correctly
- universal acceptance of the TLD

17. (OPTIONAL) Provide a representation of the label according to the International Phonetic Alphabet (http://www.langsci.ucl.ac.uk/ipa/).

N/A

Mission/Purpose

18(a). Describe the mission/purpose of your proposed gTLD.

Founded in 1994, Amazon opened on the World Wide Web in July 1995 and today offers Earth’s Biggest Selection. Amazon seeks to be Earth’s most customer-centric company, where customers can find and discover anything they might want to buy online, and endeavors to offer its customers the lowest possible prices. Amazon and other sellers offer millions of unique new, refurbished and used items in categories such as Books; Movies, Music & Games; Digital Downloads; Electronics & Computers; Home & Garden; Toys, Kids & Baby; Grocery; Apparel, Shoes & Jewelry; Health & Beauty; Sports & Outdoors; and Tools, Auto & Industrial. Amazon Web Services provides Amazon’s own back-end technology platform, which developers can use to enable virtually any type of business. The new latest generation Kindle is the lightest, most compact Kindle ever and features the same 6-inch, most advanced electronic ink display that reads like real paper even in bright sunlight. Kindle Touch is a new addition to the Kindle family with an easy-to-use touch screen that makes it easier than ever to turn pages, search, shop, and take notes - still with all the benefits of the most advanced electronic ink display. Kindle Touch 3G is the top of the line e-reader and offers the same new design and features of Kindle Touch, with the unparalleled added convenience of free 3G. Kindle Fire is the Kindle for movies, TV shows, music, books, magazines, apps, games and web browsing with all the content, free storage in the Amazon Cloud, Whispersync, Amazon Silk (Amazon’s new revolutionary cloud-accelerated web browser), vibrant color touch screen, and powerful dual-core processor.

The mission of the .アマゾン registry is:

To provide a unique and dedicated platform for Amazon while simultaneously protecting the integrity of its brand and reputation.

A .アマゾン registry will:
- Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
- Provide Amazon a further platform for innovation.
- Enable Amazon to protect its intellectual property rights.
18(b). How do you expect that your proposed gTLD will benefit registrants, Internet users, and others?

The .アマゾン registry will benefit registrants and internet users by offering a stable and secure foundation for online communication and interaction.

What is the goal of your proposed gTLD in terms of areas of specialty, service levels or reputation?

Amazon intends for its new .アマゾン gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction. The .アマゾン registry will be run in line with current industry standards of good registry practice.

What do you anticipate your proposed gTLD will add to the current space in terms of competition, differentiation or innovation?

Amazon values the opportunity to be one of the first companies to own a gTLD. A .アマゾン registry will:
- Provide Amazon with additional controls over its technical architecture, offering a stable and secure foundation for online communication and interaction.
- Provide Amazon a further platform for innovation.
- Enable Amazon to protect its intellectual property rights.

What goals does your proposed gTLD have in terms of user experience?

Amazon intends for its new .アマゾン gTLD to provide a unique and dedicated platform for stable and secure online communication and interaction.

Provide a complete description of the applicant’s intended registration policies in support of the goals above

Amazon’s Intellectual Property group will be responsible for the development, maintenance and enforcement of a Domain Management Policy. The Domain Management Policy will define (i) the rules associated with eligibility and domain name allocation, (ii) the license terms governing the use of a .アマゾン domain name, and (iii) the dispute resolution policies for the .アマゾン gTLD. Amazon will continually update the Domain Management Policy as needed to reflect Amazon’s business goals and, where appropriate, ICANN consensus policies.

Registration of a domain name in the .アマゾン registry will be undertaken in four steps: (i) Eligibility Confirmation, (ii) Naming Convention Check, (iii) Acceptable Use Review, and (iv) Registration. All domains in the .アマゾン registry will remain the property of Amazon.

For example, on the rules of eligibility, each applied for character string must conform to the .アマゾン rules of eligibility. Each .アマゾン name must:
- be at least 3 characters and no more than 63 characters long
- not contain a hyphen on the 3rd and 4th position (tagged domains)
- contain only letters (a-z), numbers (0-9) and hyphens or a combination of these
- start and end with an alphanumeric character, not a hyphen
- not match any character strings reserved by ICANN
- not match any protected country names or geographical terms

Additionally:
- Internationalized domain names (IDN) may be supported in the .アマゾン registry at the second level.
- The .アマゾン registry will respect third party intellectual property rights.
- .アマゾン may not be delegated or assigned to third party organizations, institutions, or individuals.
- All .アマゾン domains will carry accurate and up-to-date registration records.

Amazon’s Intellectual Property group reserves the right to revoke a license to use a .アマゾン domain name, at any time, if any use of a .アマゾン domain name violates the Domain Management
Policy.

Will your proposed gTLD impose any measures for protecting the privacy of confidential information of registrants or users?

Yes. Amazon will implement appropriate privacy policies respecting requirements of local jurisdictions. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.

Describe whether and in what ways outreach and communications will help to achieve your projected benefits?

There is no foreseeable reason for Amazon to undertake public outreach or mass communication about its new gTLD registry because domains will be provisioned in line with Amazon’s business goals.

18(c). What operating rules will you adopt to eliminate or minimize social costs?

Amazon intends to initially provision a relatively small number of domains in the .アマゾン registry to support the business goals of Amazon. These initiatives should not impose social costs of any type on consumers.

How will multiple applications for a particular domain be resolved, for example, by auction or on a first come first served basis?

Applications from Amazon and its subsidiaries for domains in the .アマゾン registry will be considered by Amazon’s Intellectual Property group and allocated in line with Amazon’s business goals. The .アマゾン registry will not be promoted by hundreds of registrars simultaneously, so there will not be multiple-applications for a particular domain.

Explain any cost benefits for registrants you intend to implement (e.g. advantageous pricing, introductory discounts, bulk registration discounts).

Domains in the .アマゾン registry will be provisioned to support the business goals of Amazon. Accordingly, “cost benefits” may be explored depending on the business goals of Amazon. Amazon shares the goals of enhancing customer trust and choice.

The Registry Agreement requires that registrars be offered the option to obtain initial domain name registrations for periods of one to ten years at the discretion of the registrar, but no greater than 10 years. Additionally the Registry Agreement requires advance written notice of price increases. Do you intend to make contractual commitments to registrants regarding the magnitude of price escalation?

The Domain Management Policy will include the costs and benefits of Amazon’s unique and dedicated platform for stable and secure online communication and interaction.

Community-based Designation

19. Is the application for a community-based TLD?
20(a). Provide the name and full description of the community that the applicant is committing to serve.

20(b). Explain the applicant's relationship to the community identified in 20(a).

20(c). Provide a description of the community-based purpose of the applied-for gTLD.

20(d). Explain the relationship between the applied-for gTLD string and the community identified in 20(a).

20(e). Provide a description of the applicant's intended registration policies in support of the community-based purpose of the applied-for gTLD.

20(f). Attach any written endorsements from institutions/groups representative of the community identified in 20(a).

Attachments are not displayed on this form.

Geographic Names

21(a). Is the application for a geographic name?

No

Protection of Geographic Names
22. Describe proposed measures for protection of geographic names at the second and other levels in the applied-for gTLD.

Amazon EU S.à r.l., with support of its ultimate parent company, Amazon.com, Inc. (collectively referred to in this response throughout as “Amazon”), is committed to managing the .アマゾン registry in full compliance with all applicable laws, consensus policies, ICANN guidelines, RFCs and the Specifications of the Registry Agreement. In the management of domain names in the .アマゾン registry, based on GAC advice and Specification 5, Amazon intends to block from initial registration those country and territory names contained in the following lists:

1. The short form (in English) of all country and territory names contained on the ISO 3166-1 list, as updated from time to time, including the European Union; and
2. The United Nations Group of Experts on Geographical Names, Technical Reference Manual for the Standardization of Geographical Names, Part III Names of Countries of the World; and

The process for reserving these names, and hence blocking them from registration, will be agreed to with our technical service provider Neustar. Because the .アマゾン registry will be a single entity registry and for purposes which serve Amazon’s strategic business aims, the reserved names cannot be offered to Governments or other official bodies for their own use as this would conflict with the mission and purpose of the gTLD. However, for the same reason, they will not be offered to third parties.

The .アマゾン registry only provides for the registration of names at the second level. No third level domains will be delegated at the registry level. It is consistent with GAC advice that Amazon may choose to create sub domains using country names or abbreviations at the third level. For example, Amazon may register information.アマゾン and its internal users may create sub domains such as jp.information.アマゾン.

Amazon may also use a folder structure to represent country names in its URLs, while the block exists at the second level. For example, information.アマゾン/japan.

We imagine that over time, there will be demand from brand gTLDs leading to the development of a standardized process for requesting GAC review and ICANN approval for the release of country and territory names for registration by the Registry Operator when the registry is a single entity registry. When such a process is in place, Amazon expects to apply for the release of country and territory names within .アマゾン.

Registry Services

23. Provide name and full description of all the Registry Services to be provided.

23.1 Introduction

Amazon EU S.à r.l. has elected to partner with Neustar, Inc. to provide back-end services for the .アマゾン registry. In making this decision, Amazon EU S.à r.l. recognized that Neustar already possesses a production-proven registry system that can be quickly deployed and smoothly operated over its robust, flexible, and scalable world-class infrastructure. The existing registry services will be leveraged for the .アマゾン registry. The following section describes the registry services to be provided.
23.2 Standard Technical and Business Components

Neustar will provide the highest level of service while delivering a secure, stable and comprehensive registry platform. Amazon EU S.à r.l. will use Neustar’s Registry Services platform to deploy the .アマゾン registry, by providing the following Registry Services (none of these services are offered in a manner that is unique to .アマゾン).

- Registry-Registrar Shared Registration Service (SRS)
- Extensible Provisioning Protocol (EPP)
- Domain Name System (DNS)
- WHOIS
- DNSSEC
- Data Escrow
- Dissemination of Zone Files using Dynamic Updates
- Access to Bulk Zone Files
- Dynamic WHOIS Updates
- IPv6 Support
- Rights Protection Mechanisms
- Internationalized Domain Names (IDN).

The following is a description of each of the services.

SRS

Neustar’s secure and stable SRS is a production-proven, standards-based, highly reliable, and high-performance domain name registration and management system. The SRS includes an EPP interface for receiving data from registrars for the purpose of provisioning and managing domain names and name servers. The response to Question 24 provides specific SRS information.

EPP

The .アマゾン registry will use the Extensible Provisioning Protocol (EPP) for the provisioning of domain names. The EPP implementation will be fully compliant with all RFCs. Registrars are provided with access via an EPP API and an EPP based Web GUI. With more than 10 gTLD, ccTLD, and private TLDs implementations, Neustar has extensive experience building EPP-based registries. Additional discussion on the EPP approach is presented in the response to Question 25.

DNS

Amazon EU S.à r.l. will leverage Neustar’s world-class DNS network of geographically distributed nameserver sites to provide the highest level of DNS service. The service utilizes “Anycast” routing technology, and supports both IPv4 and IPv6. The DNS network is highly proven, and currently provides service to over 20 TLDs and thousands of enterprise companies. Additional information on the DNS solution is presented in the response to Questions 35.

WHOIS

Neustar’s existing standard WHOIS solution will be used for .アマゾン. The service provides supports for near real-time dynamic updates. The design and construction is agnostic with regard to data display policy is flexible enough to accommodate any data model. In addition, a searchable WHOIS service that complies with all ICANN requirements will be provided. The following WHOIS options will be provided:

- Standard WHOIS (Port 43)
- Standard WHOIS (Web)
- Searchable WHOIS (Web)

DNSSEC

An RFC compliant DNSSEC implementation will be provided using existing DNSSEC capabilities. Neustar is an experienced provider of DNSSEC services, and currently manages signed zones for three large top level domains: .biz, .us, and .co. Registrars are provided with the ability to submit and manage DS records using EPP, or through a web GUI. Additional information on DNSSEC, including the management of security extensions is found in the response to Question 43.

Data Escrow

Data escrow will be performed in compliance with all ICANN requirements in conjunction with an approved data escrow provider. The data escrow service will:

- Protect against data loss
- Follow industry best practices
- Ensure easy, accurate, and timely retrieval and restore capability in the event of a hardware failure
- Minimizes the impact of software or business failure.
Additional information on the Data Escrow service is provided in the response to Question 38. Dissemination of Zone Files using Dynamic Updates
Dissemination of zone files will be provided through a dynamic, near real-time process. Updates will be performed within the specified performance levels. The proven technology ensures that updates pushed to all nodes within a few minutes of the changes being received by the SRS. Additional information on the DNS updates may be found in the response to Question 35.

Access to Bulk Zone Files
Amazon EU S.à r.l. will provide third party access to the bulk zone file in accordance with specification 4, Section 2 of the Registry Agreement. Credentialing and dissemination of the zone files will be facilitated through the Central Zone Data Access Provider.

Dynamic WHOIS Updates
Updates to records in the WHOIS database will be provided via dynamic, near real-time updates. Guaranteed delivery message oriented middleware is used to ensure each individual WHOIS server is refreshed with dynamic updates. This component ensures that all WHOIS servers are kept current as changes occur in the SRS, while also decoupling WHOIS from the SRS. Additional information on WHOIS updates is presented in response to Question 26.

IPv6 Support
The .アマゾン registry will provide IPv6 support in the following registry services: SRS, WHOIS, and DNS/DNSSEC. In addition, the registry supports the provisioning of IPv6 AAAA records. A detailed description on IPv6 is presented in the response to Question 36.

Required Rights Protection Mechanisms
Amazon EU S.à r.l. will provide all ICANN required Rights Mechanisms, including:
- Trademark Claims Service
- Trademark Post-Delegation Dispute Resolution Procedure (PDDRP)
- Registration Restriction Dispute Resolution Procedure (RRDRP)
- UDRP
- URS
- Sunrise service.

More information is presented in the response to Question 29.

Internationalized Domain Names (IDN)
IDN registrations are provided in full compliance with the IDNA protocol. Neustar possesses extensive experience offering IDN registrations in numerous TLDs, and its IDN implementation uses advanced technology to accommodate the unique bundling needs of certain languages. Character mappings are easily constructed to block out characters that may be deemed as confusing to users. A detailed description of the IDN implementation is presented in response to Question 44.

23.3 Unique Services
Amazon EU S.à r.l. will not be offering services that are unique to .アマゾン.

23.4 Security or Stability Concerns
All services offered are standard registry services that have no known security or stability concerns. Neustar has demonstrated a strong track record of security and stability within the industry.

Demonstration of Technical & Operational Capability

24. Shared Registration System (SRS) Performance

24.1 Introduction
Amazon EU S.à r.l. has partnered with Neustar, Inc., an experienced TLD registry operator, for the operation of the .アマゾン Registry. Amazon EU S.à r.l. is confident that the plan in place
for the operation of a robust and reliable Shared Registration System (SRS) as currently provided by Neustar will satisfy the criterion established by ICANN. Neustar built its SRS from the ground up as an EPP based platform and has been operating it reliably and at scale since 2001. The software currently provides registry services to five TLDs (.BIZ, .US, TEL, .CO and .TRAVEL) and is used to provide gateway services to the .CN and .TW registries. Neustar’s state of the art registry has a proven track record of being secure, stable, and robust. It manages more than 6 million domains, and has over 300 registrars connected today. The following describes a detailed plan for a robust and reliable SRS that meets all ICANN requirements including compliance with Specifications 6 and 10.

24.2 The Plan for Operation of a Robust and Reliable SRS
High-level SRS System Description
The SRS to be used for .アマゾン will leverage a production-proven, standards-based, highly reliable and high-performance domain name registration and management system that fully meets or exceeds the requirements as identified in the new gTLD Application Guidebook. The SRS is the central component of any registry implementation and its quality, reliability and capabilities are essential to the overall stability of the TLD. Neustar has a documented history of deploying SRS implementations with proven and verifiable performance, reliability and availability. The SRS adheres to all industry standards and protocols. By leveraging an existing SRS platform, Amazon EU S.à r.l. is mitigating the significant risks and costs associated with the development of a new system. Highlights of the SRS include:
- State-of-the-art, production proven multi-layer design
- Ability to rapidly and easily scale from low to high volume as a TLD grows
- Fully redundant architecture at two sites
- Support for IDN registrations in compliance with all standards
- Use by over 300 Registrars
- EPP connectivity over IPv6
- Performance being measured using 100% of all production transactions (not sampling).

SRS Systems, Software, Hardware, and Interoperability
The systems and software that the registry operates on are a critical element to providing a high quality of service. If the systems are of poor quality, if they are difficult to maintain and operate, or if the registry personnel are unfamiliar with them, the registry will be prone to outages. Neustar has a decade of experience operating registry infrastructure to extremely high service level requirements. The infrastructure is designed using best of breed systems and software. Much of the application software that performs registry-specific operations was developed by the current engineering team and a result the team is intimately familiar with its operations.

The architecture is highly scalable and provides the same high level of availability and performance as volumes increase. It combines load balancing technology with scalable server technology to provide a cost effective and efficient method for scaling.

The Registry is able to limit the ability of any one registrar from adversely impacting other registrars by consuming too many resources due to excessive EPP transactions. The system uses network layer 2 level packet shaping to limit the number of simultaneous connections registrars can open to the protocol layer.

All interaction with the Registry is recorded in log files. Log files are generated at each layer of the system. These log files record at a minimum:
- The IP address of the client
- Timestamp
- Transaction Details
- Processing Time.

In addition to logging of each and every transaction with the SRS Neustar maintains audit records, in the database, of all transformational transactions. These audit records allow the Registry, in support of Amazon EU S.à r.l., to produce a complete history of changes for any domain name.

SRS Design
The SRS incorporates a multi-layer architecture that is designed to mitigate risks and easily scale as volumes increase. The three layers of the SRS are:
- Protocol Layer
- Business Policy Layer
Database.
Each of the layers is described below.
Protocol Layer
The first layer is the protocol layer, which includes the EPP interface to registrars. It consists of a high availability farm of load-balanced EPP servers. The servers are designed to be fast processors of transactions. The servers perform basic validations and then feed information to the business policy engines as described below. The protocol layer is horizontally scalable as dictated by volume. The EPP servers authenticate against a series of security controls before granting service, as follows:
- The registrar’s host exchanges keys to initiates a TLS handshake session with the EPP server.
- The registrar’s host must provide credentials to determine proper access levels.
- The registrar’s IP address must be preregistered in the network firewalls and traffic-shapers.
Business Policy Layer
The Business Policy Layer is the “brain” of the registry system. Within this layer, the policy engine servers perform rules-based processing as defined through configurable attributes. This process takes individual transactions, applies various validation and policy rules, persists data and dispatches notification through the central database in order to publish to various external systems. External systems fed by the Business Policy Layer include backend processes such as dynamic update of DNS, WHOIS and Billing. Similar to the EPP protocol farm, the SRS consists of a farm of application servers within this layer. This design ensures that there is sufficient capacity to process every transaction in a manner that meets or exceeds all service level requirements. Some registries couple the business logic layer directly in the protocol layer or within the database. This architecture limits the ability to scale the registry. Using a decoupled architecture enables the load to be distributed among farms of inexpensive servers that can be scaled up or down as demand changes. The SRS today processes over 30 million EPP transactions daily.
Database
The database is the third core components of the SRS. The primary function of the SRS database is to provide highly reliable, persistent storage for all registry information required for domain registration services. The database is highly secure, with access limited to transactions from authenticated registrars, trusted application-server processes, and highly restricted access by the registry database administrators. A full description of the database can be found in response to Question 33. Figure 24-1 depicts the overall SRS architecture including network components.
Number of Servers
As depicted in the SRS architecture diagram above Neustar operates a high availability architecture where at each level of the stack there are no single points of failures. Each of the network level devices run with dual pairs as do the databases. For the .アマゾン registry, the SRS will operate with 8 protocol servers and 6 policy engine servers. These expand horizontally as volume increases due to additional TLDs, increased load, and through organic growth. In addition to the SRS servers described above, there are multiple backend servers for services such as DNS and WHOIS. These are discussed in detail within those respective response sections.
Description of Interconnectivity with Other Registry Systems
The core SRS service interfaces with other external systems via Neustar’s external systems layer. The services that the SRS interfaces with include:
- WHOIS
- DNS
- Billing
- Data Warehouse (Reporting and Data Escrow).
Other external interfaces may be deployed to meet the unique needs of a TLD. At this time there are no additional interfaces planned for .アマゾン. The SRS includes an “external notifier” concept in its business policy engine as a message dispatcher. This design allows time-consuming backend processing to be decoupled from critical online registrar transactions. Using an external notifier solution, the registry
can utilize “control levers” that allow it to tune or to disable processes to ensure optimal performance at all times. For example, during the early minutes of a TLD launch, when unusually high volumes of transactions are expected, the registry can elect to suspend processing of one or more backend systems in order to ensure that greater processing power is available to handle the increased load requirements. This proven architecture has been used with numerous TLD launches, some of which have involved the processing of over tens of millions of transactions in the opening hours. The following are the standard three external notifiers used the SRS:

WHOIS External Notifier
The WHOIS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on WHOIS. It is important to note that, while the WHOIS external notifier feeds the WHOIS system, it intentionally does not have visibility into the actual contents of the WHOIS system. The WHOIS external notifier serves just as a tool to send a signal to the WHOIS system that a change is ready to occur. The WHOIS system possesses the intelligence and data visibility to know exactly what needs to change in WHOIS. See response to Question 26 for greater detail.

DNS External Notifier
The DNS external notifier dispatches a work item for any EPP transaction that may potentially have an impact on DNS. Like the WHOIS external notifier, the DNS external notifier does not have visibility into the actual contents of the DNS zones. The work items that are generated by the notifier indicate to the dynamic DNS update sub-system that a change occurred that may impact DNS. That DNS system has the ability to decide what actual changes must be propagated out to the DNS constellation. See response to Question 35 for greater detail.

Billing External Notifier
The billing external notifier is responsible for sending all billable transactions to the downstream financial systems for billing and collection. This external notifier contains the necessary logic to determine what types of transactions are billable. The financial systems use this information to apply appropriate debits and credits based on registrar.

Data Warehouse
The data warehouse is responsible for managing reporting services, including registrar reports, business intelligence dashboards, and the processing of data escrow files. The Reporting Database is used to create both internal and external reports, primarily to support registrar billing and contractual reporting requirement. The data warehouse databases are updated on a daily basis with full copies of the production SRS data.

Frequency of Synchronization between Servers
The external notifiers discussed above perform updates in near real-time, well within the prescribed service level requirements. As transactions from registrars update the core SRS, update notifications are pushed to the external systems such as DNS and WHOIS. These updates are typically live in the external system within 2-3 minutes.

Synchronization Scheme (e.g., hot standby, cold standby)
Neustar operates two hot databases within the data center that is operating in primary mode. These two databases are kept in sync via synchronous replication. Additionally, there are two databases in the secondary data center. These databases are updated real time through asynchronous replication. This model allows for high performance while also ensuring protection of data. See response to Question 33 for greater detail.

Compliance with Specification 6 Section 1.2
The SRS implementation for .アマゾン is fully compliant with Specification 6, including section 1.2. EPP Standards are described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. Extensible Provisioning Protocol or EPP is defined by a core set of RFCs that standardize the interface that make up the registry-registrar model. The SRS interface supports EPP 1.0 as defined in the following RFCs shown in Table 24-1.

Additional information on the EPP implementation and compliance with RFCs can be found in the response to Question 25.

Compliance with Specification 10
Specification 10 of the New TLD Agreement defines the performance specifications of the TLD, including service level requirements related to DNS, RDDS (WHOIS), and EPP. The requirements include both availability and transaction response time measurements. As an experienced registry operator, Neustar has a long and verifiable track record of providing registry services that consistently exceed the performance specifications stipulated in ICANN
agreements. This same high level of service will be provided for the .アマゾン Registry. The following section describes Neustar’s experience and its capabilities to meet the requirements in the new agreement.

To properly measure the technical performance and progress of TLDs, Neustar collects data on key essential operating metrics. These measurements are key indicators of the performance and health of the registry. Neustar’s current .biz SLA commitments are among the most stringent in the industry today, and exceed the requirements for new TLDs. Table 24-2 compares the current SRS performance levels compared to the requirements for new TLDs, and clearly demonstrates the ability of the SRS to exceed those requirements.

Their ability to commit and meet such high performance standards is a direct result of their philosophy towards operational excellence. See response to Question 31 for a full description of their philosophy for building and managing for performance.

24.3 Resourcing Plans
The development, customization, and on-going support of the SRS are the responsibility of a combination of technical and operational teams, including:

- Development/Engineering
- Database Administration
- Systems Administration
- Network Engineering.

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will be involved in the design and testing. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably.

The necessary resources will be pulled from the pool of operational resources described in detail in the response to Question 31. Neustar’s SRS implementation is very mature, and has been in production for over 10 years. As such, very little new development related to the SRS will be required for the implementation of the .アマゾン registry. The following resources are available from those teams:

- Development/Engineering - 19 employees
- Database Administration - 10 employees
- Systems Administration - 24 employees
- Network Engineering - 5 employees

The resources are more than adequate to support the SRS needs of all the TLDs operated by Neustar, including the .アマゾン registry.

25. Extensible Provisioning Protocol (EPP)

25.1 Introduction
Amazon EU S.à r.l.’s back-end registry operator, Neustar, has over 10 years of experience operating EPP based registries. They deployed one of the first EPP registries in 2001 with the launch of .biz. In 2004, they were the first gTLD to implement EPP 1.0. Over the last ten years Neustar has implemented numerous extensions to meet various unique TLD requirements. Neustar will leverage its extensive experience to ensure Amazon EU S.à r.l. is provided with an unparalleled EPP based registry. The following discussion explains the EPP interface which will be used for the .アマゾン registry. This interface exists within the protocol farm layer as described in Question 24 and is depicted in Figure 25-1.

25.2 EPP Interface
Registrars are provided with two different interfaces for interacting with the registry. Both are EPP based, and both contain all the functionality necessary to provision and manage domain names. The primary mechanism is an EPP interface to connect directly with the registry. This is the interface registrars will use for most of their interactions with the registry. However, an alternative web GUI (Registry Administration Tool) that can also be used to perform EPP transactions will be provided. The primary use of the Registry Administration Tool is for performing administrative or customer support tasks.

The main features of the EPP implementation are:
Standards Compliance: The EPP XML interface is compliant to the EPP RFCs. As future EPP RFCs are published or existing RFCs are updated, Neustar makes changes to the implementation keeping in mind of any backward compatibility issues.

Scalability: The system is deployed keeping in mind that it may be required to grow and shrink the footprint of the Registry system for a particular TLD.

Fault-tolerance: The EPP servers are deployed in two geographically separate data centers to provide for quick failover capability in case of a major outage in a particular data center. The EPP servers adhere to strict availability requirements defined in the SLAs.

Configurability: The EPP extensions are built in a way that they can be easily configured to turn on or off for a particular TLD.

Extensibility: The software is built ground up using object oriented design. This allows for easy extensibility of the software without risking the possibility of the change rippling through the whole application.

Auditable: The system stores detailed information about EPP transactions from provisioning to DNS and WHOIS publishing. In case of a dispute regarding a name registration, the Registry can provide comprehensive audit information on EPP transactions.

Security: The system provides IP address based access control, client credential-based authorization test, digital certificate exchange, and connection limiting to the protocol layer.

25.3 Compliance with RFCs and Specifications

The registry-registrar model is described and embodied in a number of IETF RFCs, ICANN contracts and practices, and registry-registrar agreements. As shown in Table 25-1, EPP is defined by the core set of RFCs that standardize the interface that registrars use to provision domains with the SRS. As a core component of the SRS architecture, the implementation is fully compliant with all EPP RFCs.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to EPP. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

Neustar has a long history of providing exceptional service that exceeds all performance specifications. The SRS and EPP interface have been designed to exceed the EPP specifications defined in Specification 10 of the Registry Agreement and profiled in Table 25-2. Evidence of Neustar’s ability to perform at these levels can be found in the .biz monthly progress reports found on the ICANN website.

EPP Toolkits

Toolkits, under open source licensing, are freely provided to registrars for interfacing with the SRS. Both Java and C++ toolkits will be provided, along with the accompanying documentation. The Registrar Tool Kit (RTK) is a software development kit (SDK) that supports the development of a registrar software system for registering domain names in the registry using EPP. The SDK consists of software and documentation as described below.

The software consists of working Java and C++ EPP common APIs and samples that implement the EPP core functions and EPP extensions used to communicate between the registry and registrar. The RTK illustrates how XML requests (registration events) can be assembled and forwarded to the registry for processing. The software provides the registrar with the basis for a reference implementation that conforms to the EPP registry-registrar protocol. The software component of the SDK also includes XML schema definition files for all Registry EPP objects and EPP object extensions. The RTK also includes a “dummy” server to aid in the testing of EPP clients.

The accompanying documentation describes the EPP software package hierarchy, the object data model, and the defined objects and methods (including calling parameter lists and expected response behavior). New versions of the RTK are made available from time to time to provide support for additional features as they become available and support for other platforms and languages.

25.4 Proprietary EPP Extensions
The .アマゾン registry will not include proprietary EPP extensions. Neustar has implemented various EPP extensions for both internal and external use in other TLD registries. These extensions use the standard EPP extension framework described in RFC 5730. Table 25-3 provides a list of extensions developed for other TLDs. Should the .アマゾン registry require an EPP extension at some point in the future, the extension will be implemented in compliance with all RFC specifications including RFC 3735.

The full EPP schema to be used in the .アマゾン registry is attached in the document titled “EPP Schema.”

25.5 Resourcing Plans
The development and support of EPP is largely the responsibility of the Development/Engineering and Quality Assurance teams. As an experience registry operator with a fully developed EPP solution, on-going support is largely limited to periodic updates to the standard and the implementation of TLD specific extensions. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Development/Engineering - 19 employees
Quality Assurance - 7 employees.
These resources are more than adequate to support any EPP modification needs of the .アマゾン registry.

26. Whois

26.1 Introduction
Amazon EU S.à r.l. recognizes the importance of an accurate, reliable, and up-to-date WHOIS database to governments, law enforcement, intellectual property holders and the public as a whole and is firmly committed to complying with all of the applicable WHOIS specifications for data objects, bulk access, and lookups as defined in Specifications 4 and 10 to the Registry Agreement. Amazon EU S.à r.l.’s back-end registry services provider, Neustar, has extensive experience providing ICANN and RFC-compliant WHOIS services for each of the TLDs that it operates both as a Registry Operator for gTLDs, ccTLDs and back-end registry services provider. As one of the first “thick” registry operators in the gTLD space, Neustar’s WHOIS service has been designed from the ground up to display as much information as required by a TLD and respond to a very stringent availability and performance requirement.

Some of the key features of .アマゾン’s solution include:
- Fully compliant with all relevant RFCs including 3912
- Production proven, highly flexible, and scalable with a track record of 100% availability over the past 10 years
- Exceeds current and proposed performance specifications
- Supports dynamic updates with the capability of doing bulk updates
- Geographically distributed sites to provide greater stability and performance
- In addition, .アマゾン’s thick-WHOIS solution also provides for additional search capabilities and mechanisms to mitigate potential forms of abuse as discussed below. (e.g., IDN, registrant data).

26.2 Software Components
The WHOIS architecture comprises the following components:
- An in-memory database local to each WHOIS node: To provide for the performance needs, the WHOIS data is served from an in-memory database indexed by searchable keys.
- Redundant servers: To provide for redundancy, the WHOIS updates are propagated to a cluster of WHOIS servers that maintain an independent copy of the database.
- Attack resistant: To ensure that the WHOIS system cannot be abused using malicious queries or DOS attacks, the WHOIS server is only allowed to query the local database and rate limits on queries based on IPs and IP ranges can be readily applied.
- Accuracy auditor: To ensure the accuracy of the information served by the WHOIS servers, a daily audit is done between the SRS information and the WHOIS responses for the
domain names which are updated during the last 24-hour period. Any discrepancies are resolved proactively.

- Modular design: The WHOIS system allows for filtering and translation of data elements between the SRS and the WHOIS database to allow for customizations.
- Scalable architecture: The WHOIS system is scalable and has a very small footprint. Depending on the query volume, the deployment size can grow and shrink quickly.
- Flexible: It is flexible enough to accommodate thin, thick, or modified thick models and can accommodate any future ICANN policy, such as different information display levels based on user categorization.
- SRS master database: The SRS database is the main persistent store of the Registry information. The Update Agent computes what WHOIS updates need to be pushed out. A publish-subscribe mechanism then takes these incremental updates and pushes to all the WHOIS slaves that answer queries.

26.3 Compliance with RFC and Specifications 4 and 10
Neustar has been running thick-WHOIS Services for over 10+ years in full compliance with RFC 3912 and with Specifications 4 and 10 of the Registry Agreement. RFC 3912 is a simple text based protocol over TCP that describes the interaction between the server and client on port 43. Neustar built a home-grown solution for this service. It processes millions of WHOIS queries per day.
Table 26-1 describes Neustar’s compliance with Specifications 4 and 10.

Neustar ensures compliance with all RFCs through a variety of processes and procedures. Members from the engineering and standards teams actively monitor and participate in the development of RFCs that impact the registry services, including those related to WHOIS. When new RFCs are introduced or existing ones are updated, the team performs a full compliance review of each system impacted by the change. Furthermore, all code releases include a full regression test that includes specific test cases to verify RFC compliance.

26.4 High-level WHOIS System Description
26.4.1 WHOIS Service (port 43)
The WHOIS service is responsible for handling port 43 queries. Our WHOIS is optimized for speed using an in-memory database and master-slave architecture between the SRS and WHOIS slaves.
The WHOIS service also has built-in support for IDN. If the domain name being queried is an IDN, the returned results include the language of the domain name, the domain name’s UTF-8 encoded representation along with the Unicode code page.

26.4.2 Web Page for WHOIS queries
In addition to the WHOIS Service on port 43, Neustar provides a web based WHOIS application (www.whois.アマゾン). It is an intuitive and easy to use application for the general public to use. WHOIS web application provides all of the features available in the port 43 WHOIS. This includes full and partial search on:
- Domain names
- Nameservers
- Registrant, Technical and Administrative Contacts
- Registrars
It also provides features not available on the port 43 service. These include:
1. Redemption Grace Period calculation: Based on the registry’s policy, domains in pendingDelete can be restorable or scheduled for release depending on the date/time the domain went into pendingDelete. For these domains, the web based WHOIS displays “Restorable” or “Scheduled for Release” to clearly show this additional status to the user.
2. Extensive support for international domain names (IDN)
3. Ability to perform WHOIS lookups on the actual Unicode IDN
4. Display of the actual Unicode IDN in addition to the ACE-encoded name
5. A Unicode to Punycode and Punycode to Unicode translator
6. An extensive FAQ
7. A list of upcoming domain deletions

26.5 IT and Infrastructure Resources
As described above the WHOIS architecture uses a workflow that decouples the update process from the SRS. This ensures SRS performance is not adversely affected by the load requirements of dynamic updates. It is also decoupled from the WHOIS lookup agent to ensure the WHOIS
service is always available and performing well for users. Each of Neustar’s geographically
diverse WHOIS sites use:
- Firewalls, to protect this sensitive data
- Dedicated servers for MQ Series, to ensure guaranteed delivery of WHOIS updates
- Packetshaper for source IP address-based bandwidth limiting
- Load balancers to distribute query load
- Multiple WHOIS servers for maximizing the performance of WHOIS service.
The WHOIS service uses HP BL 460C servers, each with 2 X Quad Core CPU and a 64GB of RAM. The
existing infrastructure has 6 servers, but is designed to be easily scaled with additional
servers should it be needed.
Figure 26-1 depicts the different components of the WHOIS architecture.

26.6 Interconnectivity with Other Registry System
As described in Question 24 about the SRS and further in response to Question 31, “Technical
Overview”, when an update is made by a registrar that impacts WHOIS data, a trigger is sent to
the WHOIS system by the external notifier layer. The update agent processes these updates,
transforms the data if necessary and then uses messaging oriented middleware to publish all
updates to each WHOIS slave. The local update agent accepts the update and applies it to the
local in-memory database. A separate auditor compares the data in WHOIS and the SRS daily and
monthly to ensure accuracy of the published data.

26.7 Frequency of Synchronization between Servers
Updates from the SRS, through the external notifiers, to the constellation of independent
WHOIS slaves happens in real-time via an asynchronous publish/subscribe messaging
architecture. The updates are guaranteed to be updated in each slave within the required SLA
of 95% ± 60 minutes. Please note that Neustar’s current architecture is built towards the
stricter SLAs (95% ± 15 minutes) of .BIZ. The vast majority of updates tend to happen within
2-3 minutes.

26.8 Provision for Searchable WHOIS Capabilities
Neustar will create a new web-based service to address the new search features based on
requirements specified in Specification 4 Section 1.8. The application will enable users to
search the WHOIS directory using any one or more of the following fields:
- Domain name
- Registrar ID
- Contacts and registrant’s name
- Contact and registrant’s postal address, including all the sub-fields described in EPP
  (e.g., street, city, state or province, etc.)
- Name server name and name server IP address
- The system will also allow search using non-Latin character sets which are compliant
  with IDNA specification.

The user will choose one or more search criteria, combine them by Boolean operators (AND, OR,
NOT) and provide partial or exact match regular expressions for each of the criterion name-
value pairs. The domain names matching the search criteria will be returned to the user.
Figure 26-2 shows an architectural depiction of the new service.

Potential Forms of Abuse
As recognized by the Terms of Reference for Whois Misuse Studies,
http://gnso.icann.org/issues/whois/tor-whois-misuse-studies-25sep09-en.pdf, a number of
reported and recorded harmful acts, such as spam, phishing, identity theft, and stalking which
Registrants believe were sent using WHOIS contact information. Although these Whois studies
are still underway, there is a general belief that public access to Whois data may lead to a
measurable degree of misuse – that is, to actions that cause actual harm, are illegal or
illegitimate, or otherwise contrary to the stated legitimate purpose. One of the other key
focuses of these studies will be to correlate the reported incidents of harmful acts with
anti-harvesting measures that some Registrars and Registries apply to WHOIS queries (e.g.,
rate limiting, CAPTCHA, etc.).

Neustar firmly believes that adding the increased search capabilities, without appropriate
controls could exacerbate the potential abuses associated with the Whois service. To mitigate
the risk of this powerful search service being abused by unscrupulous data miners, a layer of
security will be built around the query engine which will allow the registry to identify rogue
activities and then take appropriate measures. Potential abuses include, but are not limited
to:
- Data Mining
- Unauthorized Access
- Excessive Querying
- Denial of Service Attacks

To mitigate the abuses noted above, Neustar will implement any or all of these mechanisms as appropriate:
- Username-password based authentication
- Certificate based authentication
- Data encryption
- CAPTCHA mechanism to prevent robo invocation of Web query
- Fee-based advanced query capabilities for premium customers.

The searchable WHOIS application will adhere to all privacy laws and policies of the .アマゾン registry.

26.9 Resourcing Plans
As with the SRS, the development, customization, and on-going support of the WHOIS service is the responsibility of a combination of technical and operational teams. The primary groups responsible for managing the service include:
- Development/Engineering - 19 employees
- Database Administration - 10 employees
- Systems Administration - 24 employees
- Network Engineering - 5 employees

Additionally, if customization or modifications are required, the Product Management and Quality Assurance teams will also be involved. Finally, the Network Operations and Information Security play an important role in ensuring the systems involved are operating securely and reliably. The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. Neustar’s WHOIS implementation is very mature, and has been in production for over 10 years. As such, very little new development will be required to support the implementation of the .アマゾン registry. The resources are more than adequate to support the WHOIS needs of all the TLDs operated by Neustar, including the .アマゾン registry.

27. Registration Life Cycle

27.1 Registration Life Cycle
Introduction
.アマゾン will follow the lifecycle and business rules found in the majority of gTLDs today. Our back-end operator, Neustar, has over ten years of experience managing numerous TLDs that utilize standard and unique business rules and lifecycles. This section describes the business rules, registration states, and the overall domain lifecycle that will be used for .アマゾン.

Domain Lifecycle - Description
The registry will use the EPP 1.0 standard for provisioning domain names, contacts and hosts. Each domain record is comprised of three registry object types: domain, contacts, and hosts. Domains, contacts and hosts may be assigned various EPP defined statuses indicating either a particular state or restriction placed on the object. Some statuses may be applied by the Registrar; other statuses may only be applied by the Registry. Statuses are an integral part of the domain lifecycle and serve the dual purpose of indicating the particular state of the domain and indicating any restrictions placed on the domain. The EPP standard defines 17 statuses, however only 14 of these statuses will be used in the .アマゾン registry per the defined .アマゾン business rules.

The following is a brief description of each of the statuses. Server statuses may only be applied by the Registry, and client statuses may be applied by the Registrar.
- OK - Default status applied by the Registry.
- Inactive - Default status applied by the Registry if the domain has less than 2 nameservers.
- PendingCreate - Status applied by the Registry upon processing a successful Create command, and indicates further action is pending. This status will not be used in the .アマゾン
registry.
- PendingTransfer - Status applied by the Registry upon processing a successful Transfer request command, and indicates further action is pending.
- PendingDelete - Status applied by the Registry upon processing a successful Delete command that does not result in the immediate deletion of the domain, and indicates further action is pending.
- PendingRenew - Status applied by the Registry upon processing a successful Renew command that does not result in the immediate renewal of the domain, and indicates further action is pending. This status will not be used in the .アマゾン registry.
- PendingUpdate - Status applied by the Registry if an additional action is expected to complete the update, and indicates further action is pending. This status will not be used in the .アマゾン registry.
- Hold - Removes the domain from the DNS zone.
- UpdateProhibited - Prevents the object from being modified by an Update command.
- TransferProhibited - Prevents the object from being transferred to another Registrar by the Transfer command.
- RenewProhibited - Prevents a domain from being renewed by a Renew command.
- DeleteProhibited - Prevents the object from being deleted by a Delete command.

The lifecycle of a domain begins with the registration of the domain. All registrations must follow the EPP standard, as well as the specific business rules described in the response to Question 18 above. Upon registration a domain will either be in an active or inactive state. Domains in an active state are delegated and have their delegation information published to the zone. Inactive domains either have no delegation information or their delegation information in not published in the zone. Following the initial registration of a domain, one of five actions may occur during its lifecycle:
- Domain may be updated
- Domain may be deleted, either within or after the add-grace period
- Domain may be renewed at anytime during the term
- Domain may be auto-renewed by the Registry
- Domain may be transferred to another registrar.

Each of these actions may result in a change in domain state. This is described in more detail in the following section. Every domain must eventually be renewed, auto-renewed, transferred, or deleted. A registrar may apply EPP statuses described above to prevent specific actions such as updates, renewals, transfers, or deletions.

27.1.1 Registration States
Domain Lifecycle - Registration States
- As described above the .アマゾン registry will implement a standard domain lifecycle found in most gTLD registries today. There are five possible domain states:
  - Active
  - Inactive
  - Locked
  - Pending Transfer
  - Pending Delete.

All domains are always in either an Active or Inactive state, and throughout the course of the lifecycle may also be in a Locked, Pending Transfer, and Pending Delete state. Specific conditions such as applied EPP policies and registry business rules will determine whether a domain can be transitioned between states. Additionally, within each state, domains may be subject to various timed events such as grace periods, and notification periods.

Active State
The active state is the normal state of a domain and indicates that delegation data has been provided and the delegation information is published in the zone. A domain in an Active state may also be in the Locked or Pending Transfer states.

Inactive State
The Inactive state indicates that a domain has not been delegated or that the delegation data has not been published to the zone. A domain in an Inactive state may also be in the Locked or Pending Transfer states. By default all domain in the Pending Delete state are also in the Inactive state.

Locked State
The Locked state indicates that certain specified EPP transactions may not be performed to the domain. A domain is considered to be in a Locked state if at least one restriction has been
placed on the domain; however up to eight restrictions may be applied simultaneously. Domains in the Locked state will also be in the Active or Inactive, and under certain conditions may also be in the Pending Transfer or Pending Delete states.

Pending Transfer State
The Pending Transfer state indicates a condition in which there has been a request to transfer the domain from one registrar to another. The domain is placed in the Pending Transfer state for a period of time to allow the current (losing) registrar to approve (ack) or reject (nack) the transfer request. Registrars may only nack requests for reasons specified in the Inter-Registrar Transfer Policy.

Pending Delete State
The Pending Delete State occurs when a Delete command has been sent to the Registry after the first 5 days (120 hours) of registration. The Pending Delete period is 35-days during which the first 30-days the name enters the Redemption Grace Period (RGP) and the last 5-days guarantee that the domain will be purged from the Registry Database and available to public pool for registration on a first come, first serve basis.

27.1.2 Typical Registration Lifecycle Activities

Domain Creation Process
The creation (registration) of domain names is the fundamental registry operation. All other operations are designed to support or compliment a domain creation. The following steps occur when a domain is created.

1. Contact objects are created in the SRS database. The same contact object may be used for each contact type, or they may all be different. If the contacts already exist in the database this step may be skipped.

2. Nameservers are created in the SRS database. Nameservers are not required to complete the registration process; however any domain with less than 2 name servers will not be resolvable.

3. The domain is created using the each of the objects created in the previous steps. In addition, the term and any client statuses may be assigned at the time of creation. The actual number of EPP transactions needed to complete the registration of a domain name can be as few as one and as many as 40. The latter assumes seven distinct contacts and 13 nameservers, with Check and Create commands submitted for each object.

Update Process
Registry objects may be updated (modified) using the EPP Modify operation. The Update transaction updates the attributes of the object.

For example, the Update operation on a domain name will only allow the following attributes to be updated:

- Domain statuses
- Registrant ID
- Administrative Contact ID
- Billing Contact ID
- Technical Contact ID
- Nameservers
- AuthInfo
- Additional Registrar provided fields.

The Update operation will not modify the details of the contacts. Rather it may be used to associate a different contact object (using the Contact ID) to the domain name. To update the details of the contact object the Update transaction must be applied to the contact itself.

For example, if an existing registrant wished to update the postal address, the Registrar would use the Update command to modify the contact object, and not the domain object.

Renew Process
The term of a domain may be extended using the EPP Renew operation. ICANN policy general establishes the maximum term of a domain name to be 10 years, and Neustar recommends not deviating from this policy. A domain may be renewed/extended at any point time, even immediately following the initial registration. The only stipulation is that the overall term of the domain name may not exceed 10 years. If a Renew operation is performed with a term value will extend the domain beyond the 10 year limit, the Registry will reject the transaction entirely.

Transfer Process
The EPP Transfer command is used for several domain transfer related operations:

- Initiate a domain transfer
Cancel a domain transfer
Approve a domain transfer
Reject a domain transfer.

To transfer a domain from one Registrar to another the following process is followed:
4. The gaining (new) Registrar submits a Transfer command, which includes the AuthInfo code of the domain name.
5. If the AuthInfo code is valid and the domain is not in a status that does not allow transfers the domain is placed into pendingTransfer status
6. A poll message notifying the losing Registrar of the pending transfer is sent to the Registrar's message queue
7. The domain remains in pendingTransfer status for up to 120 hours, or until the losing (current) Registrar Ack (approves) or Nack (rejects) the transfer request
8. If the losing Registrar has not Acked or Nacked the transfer request within the 120 hour timeframe, the Registry auto-approves the transfer
9. The requesting Registrar may cancel the original request up until the transfer has been completed.

A transfer adds an additional year to the term of the domain. In the event that a transfer will cause the domain to exceed the 10 year maximum term, the Registry will add a partial term up to the 10 year limit. Unlike with the Renew operation, the Registry will not reject a transfer operation.

Deletion Process

A domain may be deleted from the SRS using the EPP Delete operation. The Delete operation will result in either the domain being immediately removed from the database or the domain being placed in pendingDelete status. The outcome is dependent on when the domain is deleted. If the domain is deleted within the first five days (120 hours) of registration, the domain is immediately removed from the database. A deletion at any other time will result in the domain being placed in pendingDelete status and entering the Redemption Grace Period (RGP). Additionally, domains that are deleted within five days (120 hours) of any billable (add, renew, transfer) transaction may be deleted for credit.

27.1.3 Applicable Time Elements
The following section explains the time elements that are involved.
Grace Periods

There are six grace periods:
- Add-Delete Grace Period (AGP)
- Renew-Delete Grace Period
- Transfer-Delete Grace Period
- Auto-Renew-Delete Grace Period
- Auto-Renew Grace Period
- Redemption Grace Period (RGP).

The first four grace periods listed above are designed to provide the Registrar with the ability to cancel a revenue transaction (add, renew, or transfer) within a certain period of time and receive a credit for the original transaction. The following describes each of these grace periods in detail.

Add-Delete Grace Period
The AGP is associated with the date the Domain was registered. Domains may be deleted for credit during the initial 120 hours of a registration, and the Registrar will receive a billing credit for the original registration. If the domain is deleted during the Add Grace Period, the domain is dropped from the database immediately and a credit is applied to the Registrar’s billing account.

Renew-Delete Grace Period
The Renew-Delete Grace Period is associated with the date the Domain was renewed. Domains may be deleted for credit during the 120 hours after a renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly renewed. It should be noted that domains that are deleted during the renew grace period will be treated as pendingDelete and will enter the RGP (see below).

Transfer-Delete Grace Period
The Transfer-Delete Grace Period is associated with the date the Domain was transferred to another Registrar. Domains may be deleted for credit during the 120 hours after a transfer. It should be noted that domains that are deleted during the renew grace period will be placed into pendingDelete and will enter the RGP. A deletion of domain after a transfer is not the method used to correct a transfer mistake. Domains that have been erroneously transferred or
hijacked by another party can be transferred back to the original registrar through various means including contacting the Registry.

Auto-Renew-Delete Grace Period
The Auto-Renew-Delete Grace Period is associated with the date the Domain was auto-renewed. Domains may be deleted for credit during the 120 hours after an auto-renewal. The grace period is intended to allow Registrars to correct domains that were mistakenly auto-renewed. It should be noted that domains that are deleted during the auto-renew delete grace period will be placed into pendingDelete and will enter the RGP.

Auto-Renew Grace Period
The Auto-Renew Grace Period is a special grace period intended to provide registrants with an extra amount of time, beyond the expiration date, to renew their domain name. The grace period lasts for 45 days from the expiration date of the domain name. Registrars are not required to provide registrants with the full 45 days of the period.

Redemption Grace Period
The RGP is a special grace period that enables Registrars to restore domains that have been inadvertently deleted but are still in pendingDelete status within the Redemption Grace Period. All domains enter the RGP except those deleted during the AGP.

The RGP period is 30 days, during which time the domain may be restored using the EPP RenewDomain command as described below. Following the 30day RGP period the domain will remain in pendingDelete status for an additional five days, during which time the domain may NOT be restored. The domain is released from the SRS, at the end of the 5 day non-restore period. A restore fee applies and is detailed in the Billing Section. A renewal fee will be automatically applied for any domain past expiration.

Neustar has created a unique restoration process that uses the EPP Renew transaction to restore the domain and fulfill all the reporting obligations required under ICANN policy. The following describes the restoration process.

27.2 State Diagram
Figure 27-1 provides a description of the registration lifecycle.

The different states of the lifecycle are active, inactive, locked, pending transfer, and pending delete. Please refer to section 27.1.1 for detail description of each of these states. The lines between the states represent triggers that transition a domain from one state to another.

The details of each trigger are described below:
- **Create**: Registry receives a create domain EPP command.
- **WithNS**: The domain has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
- **WithOutNS**: The domain has not met the minimum number of nameservers required by registry policy. The domain will not be in the DNS zone.
- **Remove Nameservers**: Domain’s nameserver(s) is removed as part of an update domain EPP command. The total nameserver is below the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
- **Add Nameservers**: Nameserver(s) has been added to domain as part of an update domain EPP command. The total number of nameservers has met the minimum number of nameservers required by registry policy in order to be published in the DNS zone.
- **Delete**: Registry receives a delete domain EPP command.
- **DeleteAfterGrace**: Domain deletion does not fall within the add grace period.
- **DeleteWithinAddGrace**: Domain deletion falls within add grace period.
- **Restore**: Domain is restored. Domain goes back to its original state prior to the delete command.
- **Transfer**: Transfer request EPP command is received.
- **Transfer Approve/Cancel/Reject**: Transfer approved or cancel or rejected.
- **TransferProhibited**: The domain is in clientTransferProhibited and/or serverTransferProhibited status. This will cause the transfer request to fail. The domain goes back to its original state.
- **DeleteProhibited**: The domain is in clientDeleteProhibited and/or serverDeleteProhibited status. This will cause the delete command to fail. The domain goes back to its original state.
Note: the locked state is not represented as a distinct state on the diagram as a domain may be in a locked state in combination with any of the other states: inactive, active, pending transfer, or pending delete.

27.2.1 EPP RFC Consistency
As described above, the domain lifecycle is determined by ICANN policy and the EPP RFCs. Neustar has been operating ICANN TLDs for the past 10 years consistent and compliant with all the ICANN policies and related EPP RFCs.

27.3 Resources
The registration lifecycle and associated business rules are largely determined by policy and business requirements; as such the Product Management and Policy teams will play a critical role in working with Amazon EU S.à r.l. to determine the precise rules that meet the requirements of the TLD. Implementation of the lifecycle rules will be the responsibility of Development/Engineering team, with testing performed by the Quality Assurance team.

Neustar’s SRS implementation is very flexible and configurable, and in many cases development is not required to support business rule changes.

The .アマゾン registry will be using standard lifecycle rules, and as such no customization is anticipated. However should modifications be required in the future, the necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Development/Engineering – 19 employees
Registry Product Management – 4 employees
These resources are more than adequate to support the development needs of all the TLDs operated by Neustar, including the .アマゾン registry.

28. Abuse Prevention and Mitigation

28.1 Abuse Prevention and Mitigation
Amazon EU S.à r.l. and its registry service provider, Neustar, recognize that preventing and mitigating abuse and malicious conduct in the .アマゾン registry is an important and significant responsibility. Amazon EU S.à r.l. will leverage Neustar’s extensive experience in establishing and implementing registration policies to prevent and mitigate abusive and malicious domain activity within the proposed .アマゾン space.

.アマゾン will be a single entity registry, with all domains registered to Amazon for use in pursuit of Amazon’s business goals. There will be no re-sellers in .アマゾン and there will be no market in .アマゾン domains. Amazon will strictly control the use of .アマゾン domains.

Opportunities for abusive and malicious domain activity in .アマゾン are therefore very restricted but we will nonetheless abide by our obligations to ICANN. A responsible domain name registry works towards the eradication of abusive domain name registrations and malicious activity, which may include conduct such as:

- Illegal or fraudulent actions
- Spam
- Phishing
- Pharming
- Distribution of malware
- Fast flux hosting
- Botnets
- Malicious hacking
- Distribution of child pornography
- Online sale or distribution of illegal pharmaceuticals.

By taking an active role in researching and monitoring abusive domain name registration and malicious conduct, Neustar has developed the ability to efficiently work with various law enforcement and security communities to mitigate fast flux DNS-using botnets.

Policies and Procedures to Minimize Abusive Registrations
A registry must have the policies, resources, personnel, and expertise in place to combat such abusive registration and malicious conduct. Neustar, Amazon EU S.à r.l.’s registry services provider, has played a leading role in preventing such abusive practices, and has developed and implemented a “domain takedown” policy. Amazon EU S.à r.l. also believes that combating
abusive use of the DNS is important in protecting registrants.

Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution. Because removing a domain name from the zone will stop all activity associated with the domain name, including websites and e-mail, the decision to remove a domain name from the DNS must follow a documented process, culminating in a determination that the domain name to be removed poses a threat to the security and stability of the Internet or the registry. Amazon EU S.à r.l., via Neustar, has an extensive, defined, and documented process for taking the necessary action of removing a domain from the zone when its presence in the zone poses a threat to the security and stability of the infrastructure of the Internet or the registry.

Abuse Point of Contact

As required by the Registry Agreement, Amazon EU S.à r.l. will establish and publish on its website a single abuse point of contact responsible for addressing inquiries from law enforcement and the public related to malicious and abusive conduct. Amazon EU S.à r.l. will also provide such information to ICANN before delegating any domain names in .アマゾン. This information shall consist of, at a minimum, a valid e-mail address dedicated solely to the handling of malicious conduct complaints, and a telephone number and mailing address for the primary contact. Amazon EU S.à r.l. will ensure that this information is accurate and current, and that updates are provided to ICANN if and when changes are made. In addition, the registry services provider for .アマゾン, Neustar, shall continue to have an additional point of contact for requests from registrars related to abusive domain name practices.

28.2 Policies Regarding Abuse Complaints

Amazon EU S.à r.l. will adopt an Acceptable Use Policy that (i) clearly defines the types of activities that will not be permitted in .アマゾン; (ii) reserves Amazon EU S.à r.l.’s right to lock, cancel, transfer or otherwise suspend or take down domain names violating the Acceptable Use Policy; and (iii) identify the circumstances under which Amazon EU S.à r.l. may share information with law enforcement. Amazon EU S.à r.l. will incorporate its .アマゾン Acceptable User Policy into its Registry-Registrar Agreement.

Under the .アマゾン Acceptable Use Policy, which is set forth below, Amazon EU S.à r.l. may lock down the domain name to prevent any changes to the domain name contact and nameserver information, place the domain name “on hold” rendering the domain name non-resolvable, transfer the domain name to another registrar and/or in cases in which the domain name is associated with an ongoing law enforcement investigation, Amazon EU S.à r.l. will coordinate with law enforcement to assist in the investigation as described in more detail below.

It is Amazon EU S.à r.l.’s intention that all .アマゾン domain names will be registered and used by it and its Affiliates and that only ICANN-accredited registrars that have signed a Registry-Registrar Agreement will be permitted to register .アマゾン domain names. Accordingly, the potential for abusive registrations and malicious conduct in the .アマゾン registry is expected to be limited. In the unlikely event that such abuse should occur, Amazon EU S.à r.l. will work with its registry services provider, Neustar, to implement the following policies and processes to prevent and mitigate such activities. Below is initial Acceptable Use Policy for the .アマゾン registry.

.アマゾン Acceptable Use Policy

This Acceptable Use Policy gives the .アマゾン registry the ability to quickly lock, cancel, transfer or take ownership of any .アマゾン domain name, either temporarily or permanently, if the domain name is being used in a manner that appears to threaten the stability, integrity or security of the .アマゾン registry, or any of its registrar partners - and/or that may put the safety and security of any registrant or user at risk. The process also allows the .アマゾン registry to take preventive measures to avoid any such criminal or security threats. The Acceptable Use Policy may be triggered through a variety of channels, including, among other things, private complaint, public alert, government or enforcement agency outreach, and the on-going monitoring by the .アマゾン registry or its partners. In all cases, the .アマゾン registry or its designees will alert .アマゾン registry’s registrar partners about any identified threats and will work closely with them to bring offending sites into compliance. The following are some (but not all) activities that may be subject to rapid domain compliance:

- Phishing: the attempt to acquire personally identifiable information by masquerading as a website other than .アマゾン’s own.
- Pharming: the redirection of Internet users to websites other than those the user
intends to visit, usually through unauthorized changes to the Hosts file on a victim’s computer or DNS records in DNS servers.

- Dissemination of Malware: the intentional creation and distribution of “malicious” software designed to infiltrate a computer system without the owner’s consent, including, without limitation, computer viruses, worms, key loggers, and Trojans.
- Fast Flux Hosting: a technique used to shelter Phishing, Pharming and Malware sites and networks from detection and to frustrate methods employed to defend against such practices, whereby the IP address associated with fraudulent websites are changed rapidly so as to make the true location of the sites difficult to find.
- Botnetting: the development and use of a command, agent, motor, service, or software which is implemented: (1) to remotely control the computer or computer system of an Internet user without their knowledge or consent, (2) to generate direct denial of service (DDOS) attacks.
- Malicious Hacking: the attempt to gain unauthorized access (or exceed the level of authorized access) to a computer, information system, user account or profile, database, or security system.
- Child Pornography: the storage, publication, display and/or dissemination of pornographic materials depicting individuals under the age of majority in the relevant jurisdiction.

The .アマゾン registry reserves the right, in its sole discretion, to take any administrative and operational actions necessary, including the use of computer forensics and information security technological services, among other things, in order to implement the Acceptable Use Policy. In addition, the .アマゾン registry reserves the right to deny, cancel or transfer any registration or transaction, or place any domain name(s) on registry lock, hold or similar status, that it deems necessary, in its discretion (1) to protect the integrity and stability of the registry; (2) to comply with any applicable laws, government rules or requirements, requests of law enforcement, or any dispute resolution process; (3) to avoid any liability, civil or criminal, on the part of the .アマゾン registry as well as its affiliates, subsidiaries, officers, directors, and employees; (4) per the terms of the registration agreement, or (5) to correct mistakes made by the .アマゾン registry or any Registrar in connection with a domain name registration. The .アマゾン registry also reserves the right to place upon registry lock, hold or similar status a domain name during resolution of a dispute.

Taking Action Against Abusive and/or Malicious Activity

The .アマゾン registry is committed to acting in a timely manner against those domain names associated with abuse or malicious conduct in violation of the Acceptable Use Policy. After a complaint is received from a trusted source or third-party, or detected by the .アマゾン registry, the registry will use commercially reasonable efforts to verify the information in the complaint. If that information can be verified to the best of the registry's ability, the sponsoring registrar will be notified and have 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. If the registrar has not acted when the 12-hour period ends (i.e., is unresponsive to the request or refuses to take action), the .アマゾン registry will place the domain on “ServerHold”. (It is unlikely the registrar will not timely act because Amazon EU S.à r.l. intends to use a single, gateway registrar with which it has a contract reflecting these policies). ServerHold removes the domain name from the .アマゾン zone, but the domain name record still appears in the TLD WHOIS database so that the name and entities can be investigated by law enforcement should they desire to get involved.

Coordination with Law Enforcement

Amazon EU S.à r.l. will obtain assistance from Neustar to meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of the .アマゾン registry. The .アマゾン registry will respond to legitimate law enforcement inquiries promptly upon receiving the request.

The response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. for rapid resolution of the request. If the request involves any of the activities that can be validated by the registry and implicates activity covered by the .アマゾン Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the
activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .アマゾン Registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

Monitoring for Malicious Activity

Neustar, .アマゾン’s registry services provider, has developed and implemented an active “domain takedown” policy in which the registry itself takes down abusive domain names. Neustar targets domain names verified to be abusive and removes them within 12 hours regardless of whether the domain name registrar cooperated. Neustar has determined that the benefit in removing such threats outweighs any potential damage to the registrar/registrant relationship. Amazon EU S.à r.l.’s restrictions on registration eligibility make it unlikely that any .アマゾン domains will be taken down. The .アマゾン registry rules are anticipated to exclude third parties beyond Amazon EU S.à r.l. and its Affiliates. Moreover, only registrars that contractually agree to cooperate in stemming abusive behaviors will be permitted to register .アマゾン domain names.

Neustar’s active prevention policies stem from the notion that registrants in .アマゾン have a reasonable expectation that they control the data associated with their domains, especially its presence in the DNS zone. Removing a domain name from the DNS before it can cause harm is often the best preventative measure for thwarting certain malicious conduct such as botnets and malware distribution that harms not only the domain name registrant, but also potentially millions of unsuspecting Internet users.

Rapid Takedown Process

Since implementing the program, Neustar has developed two basic variations of the process. The more common process variation is a lightweight process that is triggered by “typical” notices. The less common variation is the full process that is triggered by unusual notices, which generally allege that a domain name is being used to threaten the stability and security of the TLD, or is part of a real-time investigation by law enforcement or security researchers. In these cases, accelerated action by the registry is necessary. These processes are described below, though it is important to note that .アマゾン will be managed as a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s subsidiaries. Therefore, the potential for abusive registrations and other activities that have a negative impact on Internet users is minimal. In the unlikely event that such abuse should occur, Amazon with its registry operator, Neustar, will implement the following policies and processes to manage such activities.

Lightweight Process

In addition to having an active Information Security group that, on its own initiatives, seeks out abusive practices in the .アマゾン registry, Neustar is an active member in a number of security organizations that have the expertise and experience in receiving and investigating reports of abusive DNS practices, including but not limited to, the Anti-Phishing Working Group, Castle Cops, NSP-SEC, the Registration Infrastructure Safety Group and others. Each of these sources is a well-known security organization that has a reputation for preventing abuse and malicious conduct on the Internet. Aside from these organizations, Neustar also actively participates in privately run security associations that operate based on trust and anonymity, making it much easier to obtain information regarding abusive DNS activity.

Once a complaint is received from a trusted source or third-party, or detected by Neustar’s internal security group, information about the abusive practice is forwarded to an internal mail distribution list that includes members of Neustar’s operations, legal, support, engineering, and security teams for immediate response (“CERT Team”). Although the impacted URL is included in the notification e-mail, the CERT Team is trained not to investigate the URLs themselves because the URLs in question often have scripts, bugs, etc. that can compromise the individual’s own computer and the network safety. Rather, the investigation is conducted by CERT team members who can access the URLs in a laboratory environment to avoid compromising the Neustar network. The lab environment is designed specifically for these types of tests and is scrubbed on a regular basis to ensure that none of Neustar’s internal or external network elements are harmed in any fashion.

Once the complaint has been reviewed and the alleged abusive domain name activity is verified to the best of the ability of the CERT Team, the sponsoring registrar has 12 hours to investigate the activity and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone.

The .アマゾン Registry will place the domain on “ServerHold” if the registrar has not acted
within the 12-hour period. ServerHold removes the domain name from the .アマゾン zone, but the domain name record still appears in the TLD WHOIS database so that the name and entities can be investigated by law enforcement.

Full Process
In the unlikely event with a single entity registry, whose registrants will be internal stakeholders of Amazon or Amazon’s subsidiaries, that Neustar receives a complaint that claims that a domain name is being used to threaten the stability and security of the .アマゾン registry, or is a part of a real-time investigation by law enforcement or security, Neustar follows a slightly different course of action.

Upon initiation of this process, members of the CERT Team are paged and a teleconference bridge is immediately opened up for the CERT Team to assess whether the activity warrants immediate action. If the CERT Team determines the incident is not an immediate threat to the security and the stability of critical Internet infrastructure, the CERT Team provides documentation to the Neustar Network Operations Center to clearly capture the rationale for the decision and either refers the incident to the Lightweight process set forth above or closes the incident.

However, if the CERT TEAM determines that there is a reasonable likelihood that the incident warrants immediate action, a determination is made to immediately remove the domain from the zone. As such, Customer Support will contact Amazon EU S.à r.l.’s registrar immediately to communicate that there is a domain involved in a security and stability issue. The registrar is provided only the domain name in question and the broadly stated type of incident. As .アマゾン is a Single Entity Registry using a single registrar whose work will be strictly controlled through a Service Level Agreement that includes the implementation of measures to prevent abusive registrations, the risk of evidence of abuse being compromised is minimized.

Coordination with Law Enforcement & Industry Groups
Neustar has a close working relationship with a number of law enforcement agencies, both in the United States and Internationally. For example, in the United States, Neustar is in constant communication with the Federal Bureau of Investigation, US CERT, Homeland Security, the Food and Drug Administration, and the National Center for Missing and Exploited Children. Neustar also participates in a number of industry groups aimed at sharing information among key industry players about the abusive registration and use of domain names. These groups include the Anti-Phishing Working Group and the Registration Infrastructure Safety Group (where Neustar served for several years on the Board of Directors). Through these organizations and others, Neustar proactively shares information with other registries, registrars, ccTLDs, law enforcement, security professionals, etc. not only on abusive domain name registrations within its own TLDs, but also with respect to information uncovered with respect to domain names in other registries’ TLDs. Neustar has often found that rarely are abuses found only in the TLDs for which it manages, but also within other TLDs, such as .com and .info. Neustar routinely provides this information to the other registries so that the relevant registry can take the appropriate action.

With the assistance of Neustar as its registry services provider, Amazon EU S.à r.l. can meet its obligations under Section 2.8 of the Registry Agreement to take reasonable steps to investigate and respond to reports from law enforcement and governmental and quasi-governmental agencies of illegal conduct in connection with the use of its .アマゾン registry. Amazon EU S.à r.l. and/or Neustar will respond to legitimate law enforcement inquiries promptly upon receiving the request. Such response shall include, at a minimum, an acknowledgement of receipt of the request, questions or comments concerning the request, and an outline of the next steps to be taken by Amazon EU S.à r.l. and/or Neustar for rapid resolution of the request.

If the request involves any of the activities that can be validated by the registry and/or Neustar and implicates the type of activity set forth in the Acceptable Use Policy, the sponsoring registrar will have 12 hours to investigate the activity further and either (a) take down the domain name through a hold or deletion, or (b) provide the registry with a compelling argument why to keep the domain name in the zone. The .アマゾン registry will place the domain on “ServerHold” if the registrar has not acted within the 12-hour period.

28.3 Measures for Removal of Orphan Glue Records
As the Security and Stability Advisory Committee of ICANN (SSAC) rightly acknowledges, although orphaned glue records may be used for abusive or malicious purposes, the “dominant use of orphaned glue supports the correct and ordinary operation of the DNS.” See http://www.icann.org/en/committees/security/sac048.pdf.
While orphan glue often support correct and ordinary operation of the DNS, such glue records can be used maliciously to point to name servers that host domains used in illegal phishing, bot-nets, malware, and other abusive behaviors. Problems occur when the parent domain of the glue record is deleted but its children glue records still remain in DNS. Therefore, when the .アマゾン registry has written evidence of actual abuse of orphaned glue, the .アマゾン registry will act to remove those records from the zone to mitigate such malicious conduct.

Neustar runs a daily audit of entries in its DNS systems and compares those with its provisioning system, which serves as an umbrella protection that items in the DNS zone are valid. Any DNS record that shows up in the DNS zone but not in the provisioning system is flagged for investigation and removed if necessary. This daily DNS audit prevents not only orphaned hosts but also other records that should not be in the zone.

In addition, if either Amazon EU S.à r.l. or Neustar becomes aware of actual abuse on orphaned glue after receiving written notification from a third party through its Abuse Contact or through its customer support, such glue records will be removed from the zone.

28.4 Measures to Promote WHOIS Accuracy

The .アマゾン registry will implement several measures to promote WHOIS accuracy. WHOIS service for Amazon EU S.à r.l. will operate as follows. The registry will keep all basic contact details for each domain name in a unique internal system, which facilitates access to the domain information. In addition, Amazon EU S.à r.l. will perform internal monitoring checks and procedures that will only allow accurate WHOIS information and remove outdated data.

28.4.1. Authentication of Registrant Information

Amazon EU S.à r.l. will guarantee the adequate authentication of registrant data, ensuring the highest levels of accuracy and diligence when dealing with WHOIS data. In doing so, Amazon EU S.à r.l.’s solid internal system will undertake, but not be limited to the following measures: running checks against WHOIS internal records and regular verification of all contact details and other relevant registrant information. The Amazon EU S.à r.l.’s registrar will also be charged with regularly checking WHOIS accuracy.

Amazon EU S.à r.l. will have a well-defined registration policy that will include a requirement that complete and accurate registrant details are provided by the requestor for a domain. These details will be validated by the Amazon EU S.à r.l. registrar who will have a contractual duty to comply with Amazon EU S.à r.l.’s registration policy. The full details of every domain requestor will be kept in Amazon EU S.à r.l.’s on-line registry management dashboard which can be accessed by Amazon EU S.à r.l.’s Domain Management Team at any time.

28.4.2. Regular Monitoring of Registration Data

Amazon EU S.à r.l. will comply with ICANN’s WHOIS requirements. Among other measures, Amazon EU S.à r.l. will regularly remind its internal personnel to comply with ICANN’s WHOIS information Policy through regularly checking WHOIS data against internal records, offering WHOIS accuracy services, evaluating claims of fraudulent WHOIS data, and cancelling domain name registrations with outdated WHOIS details.

28.4.3. Policies and Procedures ensuring compliance

Only Amazon EU S.à r.l. and its Affiliates will be permitted to register and use Amazon EU S.à r.l. domain names. Accordingly, the duties of the Amazon EU S.à r.l. registrar will be very limited and closely defined. Regardless, Amazon EU S.à r.l.’s Registry-Registrar Agreement will require Amazon EU S.à r.l.’s registrar to take steps necessary to ensure WHOIS data is complete and accurate and to implement the .アマゾン registration policies.

28.5 Resourcing Plans

Responsibility for abuse mitigation rests with a variety of functional groups at Neustar. The Neustar Abuse Monitoring team is primarily responsible for providing analysis and conducting investigations of reports of abuse. The Neustar Customer Service team also plays an important role in assisting with investigations, responding to customers, and notifying registrars of abusive domains. Finally, the Neustar Policy/Legal team is responsible for developing the relevant policies and procedures.

The necessary resources will be pulled from the pool of available resources described in detail in the response to Question 31. The following resources are available from those teams:
Customer Support - 12 employees
Policy/Legal - Two employees
The resources are more than adequate to support the abuse mitigation procedures of the .アマゾン registry.
Furthermore,Amazon EU S.à r.l. dedicates significant financial and personnel resources to combating malicious and abusive behavior in the DNS and across the internet. Amazon EU S.à r.l. will extend these resources to designating the unique abuse point of contact, regularly monitoring potential abusive and malicious activities with support from dedicated technical staff, analyzing reported abuse and malicious activity, and acting to address such reported activity.
The designated abuse prevention staff within Neustar and Amazon EU S.à r.l. will be subject to regular evaluations, receive adequate training and work under expert supervision. The abuse prevention resources will comprise both internal staff and external abuse prevention experts who would give extra advice and support when necessary. This external staff includes experts in Amazon EU S.à r.l.’s registrar where one legal manager and four operational experts will be available to support Amazon EU S.à r.l.

Please note that in the above answer the terms “We”, “Our” and “Amazon” may refer to either the applicant Amazon EU S.à r.l. or Amazon.com Inc., the ultimate parent, or sometimes Neustar, the registry services provider.

29. Rights Protection Mechanisms

29.1 Introduction
Amazon is applying for .アマゾン to provide a dedicated platform for stable and secure online communication and interaction. Amazon has several thousand registered intellectual property assets of all types including trademarks, designs, and domain names – we place the protection of our intellectual property as a high priority and we respect the intellectual property of others.

29.1.1 Rights protection in gTLD registry operation is a core objective of Amazon. We will closely manage this TLD by registering domains through a single registrar. Although Amazon and its subsidiaries will be the only eligible registrants, we will nonetheless require our registrar to work with us on a four-step registration process featuring: (i) Eligibility Confirmation; (ii) Naming Convention Check; (iii) Acceptable Use Review; and (iv) Registration. As stated in our answer to Question 18, all domains in our registry will remain the property of Amazon and will be provisioned to support the business goals of Amazon. Because all domains will be registered and maintained by Amazon (for use that complements our strategic business goals), we can ensure that all domains in our registries will carry accurate and up-to-date registration records.

We believe that the above registration process will ensure that abusive registrations are prevented, but we will continue to monitor ICANN policy developments, and update our procedures as required.

29.2 Core measures to prevent abusive registrations
To further prevent abusive registration or cybersquatting, we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated for new gTLD operators by ICANN:
• A 30 day Sunrise process
• A 60 day Trademark Claims process

Generally, these RPMs are targeted at abusive registrations undertaken by third parties. However, domains in our registry will be registered only to Amazon or its subsidiaries through a single registrar who will be contractually required to ensure that stated rules covering eligibility and use of a domain are adhered to through a validation process. As a result, abusive registrations should be prevented.

In the very unlikely circumstances that a domain is registered and used in an improper way, we acknowledge that we will be the respondent in related proceedings and we undertake to cooperate fully with ICANN and other appropriate agencies to resolve any concerns.
29.2.1 Sunrise Eligibility
Our Sunrise Eligibility Requirements will clearly state that eligible applicants must be members of the Amazon group of companies and its subsidiaries. Furthermore, all domain names must be used to support the business goals of Amazon. Nonetheless, notice of our Sunrise will be provided to third party holders of validated trademarks in the Trademark Clearinghouse as required by ICANN. Our Sunrise Eligibility Requirements will be published on the website of our registry.

29.2.2 Sunrise Window
As required in the Applicant Guidebook in section 7.1, our Sunrise window will recognize “all word marks: (i) nationally or regionally registered and for which proof of use – which can be a declaration and a single specimen of current use – was submitted to, and validated by, the Trademark Clearinghouse; or (ii) that have been court-validated; or (iii) that are specifically protected by a statute or treaty currently in effect and that was in effect on or before 26 June 2008”.

Our Sunrise window will last for 30 days. Applications received from an ICANN-accredited registrar will be accepted for registration if they are (i) supported by an entry in the Trademark Clearinghouse (TMCH) during our Sunrise window and (ii) satisfy our Sunrise Eligibility Requirements. Once registered, those domain names will have a one year term of registration. Any domain names registered will be managed by our registrar.

29.2.3 Sunrise Dispute Resolution Policy
We will devise and publish the rules for our Sunrise Dispute Resolution Policy (SDRP) on our registry website. Our SDRP will apply to all our registries and will allow any party to raise a challenge on the following four grounds as required in the Applicant Guidebook (6.2.4): (i) At the time the challenged domain name was registered, the registrant did not hold a trademark registration of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty; (ii) The domain name is not identical to the mark on which the registrant based its Sunrise registration; (iii) The商标 mark registration on which the registrant based its Sunrise registration is not of national effect (or regional effect) or the trademark had not been court-validated or protected by statute or treaty; or (iv) The trademark registration on which the domain name registrant based its Sunrise registration did not issue on or before the effective date of the Registry Agreement and was not applied for on or before ICANN announced the applications received.

Complaints can be submitted through our registry website within 30 days following the closure of the Sunrise, and will be initially processed by our registrar. Our registrar will promptly report to us: (i) the challenger; (ii) the challenged domain name; (iii) the grounds upon which the complaint is based; and (iv) why the challenger believes the grounds are satisfied.

29.2.4 Trademark Claims Service
Our Trademark Claims Service (TMCS) will run for a 60 day period following the closure of our 30 day Sunrise. Our TMCS will be supported by the Trademark Clearinghouse and will provide a notice to third parties interested in filing a character string in our registry of a registered trademark right that matches the character string in the TMCH. We will honour and recognize in our TMCS the following types of marks as defined in the Applicant Guidebook section 7.1: (i) nationally or regionally registered; (ii) court-validated; or (iii) specifically protected by a statute or treaty in effect at the time the mark is submitted to the Clearinghouse for inclusion.

Once received from the TMCH, with which our registry provider will interface, a claim will be initially processed by our registrar who will provide a report to us on the eligibility of the applicant.

29.2.5 Implementation and Resourcing Plans of core services to prevent abusive registration
Our Sunrise and IP Claims service will be introduced with the following timetable:
Day One: Announcement of Registry Launch and publication of registry website with details of the Sunrise and Trademark Claim Service (“TMCS”)
Day 30: Sunrise opens for 30 days on a first-come, first served basis. Once registrations are approved, they will be entered into the Shared Registry System (SRS) and published in our Thick-Whois database.
Day 60-75: Registry Open, domains applied for in the Sunrise registered and TMCS begins for a minimum of 68 days
Day 120-135: TMCS ends; normal operations continue.
Our Implementation Team will comprise the following:
From Amazon: the Director of IP will lead a team of up to seven experts with experience of domain name management and on-line legal dispute resolution, with access to other teams in Amazon Legal if required.
From NeuStar, registry service provider to Amazon: A Customer Support team of 12, a Product Management Team of four and a Development / Engineering Team of 19 will be available as required to support the legal team, led by Jeff Neuman. This team has over 10 years’ experience with implementing registry launches including rights protection schemes such as the .biz Sunrise and IP Claims.
In addition, Amazon will be supported by its Registrar which will provide two legal specialists, four client managers and six operational staff. The operational staff will undertake the validation checks on registration requests.
The Implementation Team will create a formal Registry Launch plan by 1 October 2012. This plan will set out the exact process for the launch of each Amazon registry and will define responsibilities and budgets. The Registry website, which is budgeted for in the three year plans provided in our answers to Question 46, will be built by 1 December 2012 or within 30 days of pre-validation testing beginning, whichever is the sooner. It will feature Rules of Registration, Rules of Eligibility, Terms & Conditions of Registration, Acceptable Use Policies as well as the Rules of the Sunrise, the Rules of the Sunrise Dispute Resolution Policy and the Rules of the Trademark Claims Service.
Technical implementation between the registry and the Trademark Clearinghouse will be undertaken by the registry service provider as soon as practical after the Trademark Clearinghouse is operational and announces its integration process.
As demonstrated in our answer to question 46, a budget has been set aside to pay fees charged by the Trademark Clearinghouse Operator for this integration.
The contract we have with our registrar (the RAA) will require that the registrar uses the TMCH, adheres to the Terms & Conditions of the TMCH and will prohibit the registrar from filing domains in our registries on its own behalf or utilizing any data from the TMCH except in the provision of its duties as our registrar.
When processing TMCS claims, our registrar will be required to use the specific form of notice provided by ICANN in the Applicant Guidebook.
We will also require our registrar to implement appropriate privacy policies reflecting local requirements. For example, Amazon is a participant in the Safe Harbor program developed by the U.S. Department of Commerce and the European Union.
29.3 Mechanisms to identify and address the abusive use of registered domain names on an ongoing basis
To prevent the abusive use of registered domain names on an ongoing basis we will adopt the following Rights Protection Mechanisms (RPMs) which have been mandated by ICANN:
• The Uniform Dispute Resolution Policy (UDRP) to address domain names that have been registered and used in bad faith in the TLD.
• The Uniform Rapid Suspension (URS) scheme which is a faster, more efficient alternative to the Uniform Dispute Resolution Policy to deal with clear-cut cases of cybersquatting.
• The Post Delegation Dispute Resolution Procedure (PDDRP).
• Implementation of a Thick WHOIS making it easier for rights holders to identify and locate infringing parties.

The UDRP and the URS are targeted at abusive registrations undertaken by third parties and the PDDRP at so called “Bad Actor” registries. As domains in our registry will be registered not to third parties but only to Amazon or its subsidiaries through a single registrar which will be required through contract to ensure that the rules covering eligibility and use of a domain are adhered to, we believe that abusive registrations by third parties should be completely prevented.
Abusive behaviour by representatives of Amazon or our subsidiaries will be prevented by our internal processes, for example the pre-registration validation checks and monitoring of use of our registrar.
We acknowledge that we are subject to the UDRP, the URS and the PDDRP and we will co-operate fully with ICANN and appropriate registries in the unlikely circumstances that complaints
against us, as the registrant, are made.

29.3.1 The Uniform Dispute Resolution Policy (UDRP)
The UDRP is an out-of-court dispute resolution mechanism for trademark owners to resolve clear cases of bad faith, abusive registration and use of domain names. The UDRP applies by contract to all domain name registrations in gTLDs. Standing to file a UDRP complaint is limited to trademark owners who must demonstrate their rights. To prevail in a UDRP complaint, the complainant must further demonstrate that the domain name registrant has no rights or legitimate interests in the disputed domain name, and that the disputed domain name has been registered and is being used in bad faith. In the event of a successful claim, the infringing domain name registration is transferred to the complainant’s control.

Amazon or its subsidiaries will be the respondent in all UDRP complaints because we will be the only eligible registrants. Therefore we do not anticipate that there are any circumstances in which complainants can argue that we have “no rights or legitimate interests” in a domain in our registry so the possibility of good faith UDRP complaints should be minimized. In the unlikely circumstances that a complaint is made, we will respond in a timely fashion, reflecting our contractual responsibility to ICANN as a registry operator.

We will be applying for an exemption to Clause 1b of the Registry Operators Code of Conduct. This means that we will not be allowed to transfer domains to third parties as the only registrant will be Amazon or our subsidiaries. Therefore if a complaint against us is filed, the only possible remedy will be the cancellation of the domain instead of the transfer to the complainant.

Should a successful complaint be made we will therefore place the cancelled domain that is the subject of the complaint on a list that prevents it from being registered again.

29.3.2 The URS
