Arabic concerns

• Since no implementation for Arabic data in the whois, this small presentation list the concerns and issues to be taken in consideration
Data

- What languages should the whois contain, only Arabic?
- Will people who know Arabic only use it?
- Should it contain the information in the languages that is used by the different citizens in that country (e.g. first and second languages of a country?)
Each Arab ccTLD should know the problems & concerns and find the solutions before starting registering Arabic Domain names, this includes formulating the policies.
Coordination

- 22 Arab countries
- Arabic script is used in more than one language besides the Arabic like Farsi, Urdu, and Pashto...
Technical testing

- Interoperability testing is an important solution like the IDNconnect and the MINC interoperability testbed.
Notice to show another importance of the whois

- A good whois could be the alternative to Sunrise period, of course along with a good dispute resolution policy
Thank you
